SELECTED WATER RESOURCES ABSTRACTS

A monthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 15, NUMBER 5
MAY 1, 1982

W82-02101 -- W82-02600

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus**. The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

METABOLISM OF A DESERT STREAM,
Arizona State Univ., Tempe. Dept. of Zoology.
D. E. Busch, and S. G. Fisher.
Freshwater Biology, Vol 11, No 4, p 301-307, August, 1981. 1 Fig, 1 Tab, 24 Ref.

Descriptors: *Arid lands, *Aquatic life, Deserts, Benthos, Streams, Arizona, Watersheds, Photosynthesis, Floods, Sycamore Creek, *Arizona.

An initial examination was made of photosynthesis and community respiration in a central Arizona stream, Sycamore Creek, which drains a watershed of 505 square kilometers ranging in elevation from 427 to 2164 meters. Benthos in the creek in July and August 1978 could be separated into two types, mats of a filamentous green alga, Cladophora glomerata (L.) Keutz., and microorganisms free living on the sediment (epipelon). Community respiration and net photosynthesis were measured for these assemblages using submerged light/dark chambers in situ. Multiple regression analysis was used to predict gross photosynthesis as a function of photosynthetically active radiation, temperature and chlorophyll-a concentration and community respiration as a function of temperature and biomass. The calculations suggest that the creek is autotrophic during the summer and that the rates of gross photosynthesis and community respiration are high for a small stream. Considerable differences were noted between the Cladophora mat assemblages and the epipelic assemblages. The high rate of gross photosynthesis, low litter inputs, high biomass of algae, and the intermittent but severe floods that characterize Sycamore Creek indicate that this stream and other similar desert streams are net exporters of organic matter and are thus truly autotrophic stream ecosystems. (Baker-FRC)
W82-02349

1B. Aqueous Solutions and Suspensions

THE DOWNSTREAM TRANSPORT OF FINE MATERIAL AND THE ORGANIC MATTER BALANCE FOR A SECTION OF A SMALL CHALK STREAM IN SOUTHERN ENGLAND,
Freshwater Biological Association, East Stoke (England). River Lab.
F. H. Dawson.
Journal of Ecology, Vol 69, No 2, p 367-380, July, 1981. 4 Fig, 3 Tab, 24 Ref.

Descriptors: *Natural streams, *Suspended solids, *Organic matter, Seasonal variation, Vegetation effects, Sediment load, England.

The seasonal variations in the concentration of fine particulate material transport downstream for two sites along a small chalk stream (Dorset, England) were determined. One site was shaded with deciduous trees and with a few plants growing in the water; the other was shaded and dominated by submerged macrophytes. Aquatic plants were a factor in promoting the settlement and seasonal accumulation of suspended materials as banks of sediments. The mean monthly concentration of organic matter in the summer was 1-2 mg/liter dry weight, but it rose in the winter to 10 to 12 mg/liter. The large plant material resulted from in situ macrophyte production and from terrestrial leaf fall and was quickly broken down. The accumulation of organic material was predicted by summing the difference between the monthly totals of import and export for a section of stream between two sites. (Small-FRC)
W82-02192

2. WATER CYCLE

2A. General

WATER ROUTING ON DIVERGING-CONVERGING WATERSHEDS,
Technical Univ. of Instanbul (Turkey).
N. Agiralioglu.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY8, p 1003-1017, August, 1981. 10 Fig, 3 Tab, 15 Ref.

Descriptors: *Hydrographs, *Kinematic wave theory, *Diverging-converging watersheds, *Overland flow, Model studies, Rainfall-runoff relationships, Watersheds, Streamflow, *routing.

The overland flow equations depending on the kinematic wave theory are solved by using an implicit finite difference method for the diverging-converging watershed. The flow model is applied to impervious surfaces which preserve the area and length of the watershed and fix the kinematic parameters for each event. Depending on geometric parameters, the model gives hydrograph values between those of diverging and converging models, with values for the rectangular configuration in between. Different geometric representations give runoff hydrographs with different shapes under the same conditions. The diverging representation gave the longest time of concentration, the converging representation, the shortest one. The reverse is true for lag time. (Cassar-FRC)
W82-02200

USE OF CUMULANTS TO ESTIMATE COEFFICIENTS IN CHOW-KULANDAISWAMY'S GHS MODEL,
Mississippi State Univ., Mississippi State.
V. P. Singh, and R. C. McCann.
Nordic Hydrology, Vol 11, No 2, p 83-92, 1980. 3 Fig, 1 Tab.

Descriptors: *Mathematical models, *Watersheds, *Cumulative runoff, *Floods, Water storage, Hydrograph analysis, Laplace equation, Runoff, Least squares method, Mathematical studies, Infiltration, Flood hydrographs, Discharge hydrographs.

The coefficients on the General Hydrologic System model of Chow and Kulandaiswamy are estimated using the method of cumulants. The model hypothesizes that storage in the watershed can be expressed as a linear sum of surface runoff, rainfall excess, and their time derivatives. The coefficients are functions of runoff and rainfall excess. They are finite nonnegative integers. The method of cumulants estimates the coefficients independently of the derivatives of runoff and rainfall excess. The cumulants method was found to yield comparable values to those obtained by the common least squares method. The cumulants method may be more reliable if the derivatives of runoff are not estimated accurately. (Titus-FRC)

ANALYSIS OF THE RAINFALL-RUNOFF TRANSFORMATION PROCESS,
Benin National Univ., Cotonou.
A. A. Afouda.
Nordic Hydrology, Vol 11, No 2, p 93-112, 1980. 4 Fig, 21 Ref.

Descriptors: *Rainfall, *Runoff, *Mathematical models, *Hydrologic roughness, *Flow, Watersheds, Kinematic wave theory, Roughness coefficients, Hydraulic friction, Boundaries, Boundary conditions, Shear stress, Reynolds number, Froude number, Stokes law.

A generalized friction factor has been introduced to describe resistance to storm water flow over a natural watershed. This theoretical relationship has been proved to be valid for smooth surface flow, rough surface flow, and flow through porous medium. A kinematic relation which accounts for the roughness of the water shed surface has been proposed. The similarity between this kinematic relation and the friction factor has been underlined. This kinematic relationship determines the applicability of the kinematic flow theory and the approximation of the friction slope. When the kinematic approximation applies, an analytical solution can be obtained in the form of integral series. (Titus-FRC)

RUNOFF CURVE NUMBERS FOR NORTHERN PLAINS RANGELANDS,
Science and Education Administration, Boise, ID.
C. L. Hanson, E. L. Neff, J. T. Doyle, and T. L. Gilbert.
Journal of Soil and Water Conservation, Vol 36, No 5, p 302-305, September-October, 1981. 3 Fig, 2 Tab, 13 Ref.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *Range management, Erosion, Runoff, Mathematical studies, Soil types, Comparison studies, Runoff forecasting.

After reviewing the various methods for estimating runoff curve number (CN) values for rangeland watersheds, a comparison was made of the values for CN prepared by the Soil Conservation Service (SCS) in Wyoming with actual records in the area. Precipitation and runoff data from several small watersheds in western South Dakota, northeastern Wyoming, and southeastern Montana were used for this evaluation. Examples of two range sites are illustrated. The maximum summer runoff event, plus any summer runoff event of 6 millimeters or more, were used to compute the optimized CN for each watershed. The optimized CN was obtained by minimizing the sum of the squared deviations of observed and predicted runoff. Precipitation and runoff were plotted and analyzed by event. The optimized CN as well as the low and high values were computed so that the procedures outlined in the National Engineering Handbook could be expanded to Northern Plains rangeland. The computed CN values were integrated into the original Wyoming table. Optimized CN values ranged from 50 for a sandy watershed to 93 for a saline upland watershed in low-fair condition. Optimized values from the watersheds varied considerably, but their range included the value from the original table in all cases. Claypan watersheds had optimized CN values of 87 and 89, slightly lower than the values of the original table. Shallow loamy range sites had slightly higher CN values than on the original table, while three clayey watersheds had values similar to those in the table. Values similar to those on the original table were obtained for medium-textured soils, fine-textured soils with steep slopes, and primarily clayey range site watersheds. (Baker-FRC)

SNOWMELT, GLACIER MELT, AND HIGH ARCTIC STREAMFLOW REGIMES,
McMaster Univ., Hamilton (Ontario). Dept. of Geography.
P. Marsh, and W. Ming-ko.
Canadian Journal of Earth Sciences, Vol 18, No 8, p 1380-1384, August, 1981. 4 Fig, 6 Ref.

Descriptors: *Streamflow, *Arctic, *Snowmelt, Thaw, Glaciers, Seasonal variation.

The major sources of streamflow in high arctic basins were analyzed, and the flow generating process was examined. The study was carried out in an area characterized by a dissected plateau ranging in altitude from 120 to 425 m. Streamflow was the result of rainfall, spring snowmelt, and the melting of semi-permanent snowbanks and glaciers. When spring snowmelt dominated, a simple arctic nival regime resulted. When spring melt was followed by glacier melt, a typical proglacial regime resulted. Flows from year to year were highly variable, depending upon weather conditions and the rates of various sources of runoff. A complex range of regime types can be defined, and the simple classification of nival or proglacial can be used. (Small-FRC)

FLOOD EVENT MODELING - A STUDY OF TWO METHODS,

Institute of Hydrology, Wallingford (England).
M. J. Lowing, and R. G. Mein.
Water Resources Bulletin, Vol 17, No 4, p 599-606, August, 1981. 10 Fig, 2 Tab, 8 Ref.

Descriptors: *Mathematical models, *Design floods, *Runoff forecasting, Hydraulic design, Floods, Maximum probable floods, Surface runoff, Hydrographs, Comparison studies, Watersheds.

Two methods for the estimation of design flood hydrographs for gaged catchments were applied to five gaged catchments in the United Kingdom. The unit hydrograph model and a runoff routing model used in Australia were evaluated. Both models acted on rainfall excess to produce estimates of surface runoff. Both models performed well, but for many situations, the unit hydrograph procedure was more suitable. It is simple to apply and can be computed by hand. The runoff routing model has the advantage of allowing for nonuniformity within the catchment in rainfall depth or pattern, losses due to different soils or land use, or the existence of significant storages or retarding basins. This model, however, requires a computer. Alternative ways of describing the within-event distribution of losses are an important factor in the success of a model. (Small-FRC)

CHEMISTRY OF INTERSTITIAL WATER AND BOTTOM SEDIMENTS AS INDICATORS OF SEEPAGE PATTERNS IN PERCH LAKE, CHALK RIVER, ONTARIO,

Waterloo Univ. (Ontario). Dept. of Earth Sciences.
S. K. Frape, and R. J. Patterson.
Limnology and Oceanography, Vol 26, No 3, p 500-517, May, 1981. 11 Fig, 29 Ref.

Descriptors: *Groundwater movement, *Seepage, *Lakes, Interstitial water, Sediment-water interfaces, Chemical properties, Tritium, Tracers, *Perch Lake, Ontario, *Chalk River.

Theoretical subsurface, nearshore flow models were tested, and information was obtained on seepage water and the chemical processes that may occur during the passage of groundwater through lake bottom sediments in a study of Perch Lake (Chalk River, Ontario). The groundwater flow system in this lake basin has been extensively monitored, and an aquifer near the lake was contaminated with tritium, acting as a good tracer. Tritium analyses of interstitial water samples and well waters near the lake indicated a pattern of groundwater discharge or seepage consistent with the predictions of the mathematical models. Groundwater discharge deposited metals such as iron and manganese in lake sediments. Interstitial waters in sediments were mixtures of groundwater and lake water, with the resultant chemistry. Nests of piezometers adjacent to the lake are needed to define the types of groundwaters moving toward the lake. (Small-FRC)

FLASH FLOOD IN ARIZONA - OBSERVATIONS AND THEIR APPLICATION TO THE IDENTIFICATION OF FLASH-FLOOD DEPOSITS IN THE GEOLOGIC RECORD,

Geological Survey, Flagstaff, AZ.
I. Lucchitta, and N. Suneson.
Geology, Vol 9, p 414-418, September, 1981. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Sediment transport, *Flash floods, Floods, Rainfall-runoff relationships, *Arizona, Sediments.

A description is offered of a flash flood which occurred in west central Arizona in the spring of 1979. The flood occurred in the area of a major branch of Rupley Wash, which is one of the principal washes of the area and a tributary of the Big Sandy River. This branch drains an area of about 18 square kilometers underlain by Quaternary pediments, badland hills cut into upper Tertiary basin-fill deposits, and highlands underlain by Precambrian granite, Cenozoic sedimentary rocks, and Cenozoic rhyolite and basalt. The branch is a typical braided desert wash, consisting of many unvegetated, sandy and pebbly, active braid channels separated by vegetated, inactive areas. Ten to 15 minutes after the torrential rain started (shortly afternoon) the pediment surface was completely saturated and water 1 to 2 cm deep was moving in sheetflow. A few minutes later the depth was 10-20 cm. The most active part of the braid channel soon contained muddy, turbulent water 20-50 cm deep. The maximum velocity for the water was estimated at 2.5 to 3.8 meters/second. After about 30 minutes the flood was gone and the rain had almost stopped. The flood in the main channel left two kinds of deposits: widespread coarse to medium grained quartz feldspar sand, and less widespread but conspicuous medium- to fine grained sand composed of magnetite with a little ilmenite, termed black sand. It was not certain whether the flood resulted in a net accumulation or removal of material in the channel. (Baker-FRC)

A METHOD FOR OBTAINING SLOPE INFORMATION FOR HYDROLOGIC MODELS,

Ball State Univ., Muncie, IN. Dept. of Geography.
B. N. Haack.
Water Resources Bulletin, Vol 17, No 4, p 704-707, August, 1981. 2 Fig, 6 Ref.

Descriptors: *Nonpoint pollution sources, *Hydrologic models, *Slopes, Water pollution sources, Model studies, Watersheds, *Runoff, Data collections, Pollution load, Sediment, Erosion, Topography, Topographic mapping, Contours.

A method is presented for collecting surface slope information for a regional land resources information system. Slope is a necessary and important factor in water quality and soil loss models and is often difficult to obtain. The method described requires a point sampling scheme, topographic maps, and a coordinate digitizer. Sample point evaluation, slope direction, and slope magnitude are calculated from locations of the sample point and the nearest upper and lower contour lines. Slope gradient can be a useful addition to a point sampled land resources information system for the correlation of water quality data and simultaneously occurring land resource data for watershed runoff and nonpoint source water pollution analysis. Slope length, while also useful, cannot be obtained from the method presented here. One possible problem with the method is cost. In the Honey Creek project, a two person collection team averaged about 100 sample points per hour for slope data collection. Monetary restraints restricted this method to the Honey Creek watershed for the Lake Erie Wastewater Management Study. One possible source of error in the method proposed is digitizer limitations in measuring short distances. This is of particular concern when measurement distances are small, for example when a sample point is on a steep slope, as indicated by closely spaced contour lines. As long as the contour lines are uniformly spaced, the distance for digitizer measurements could be increased and small distance measurement errors decreased by selecting contour lines for slope determination other than those immediately adjacent to the sample point. (Baker-FRC)

METHODS OF CALCULATING INFILTRATION OF MELTWATERS INTO FROZEN SOIL,

I. L. Kalyuzhnyi, and K. K. Pavlova.
Hydrotechnical Construction, No 4, p 375-379, April, 1980. 7 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 4, p 29-32, April, 1980.

Descriptors: *Snowmelt, *Infiltration capacity, Infiltration, Melting, Leaching, Free water, Soil properties, Frozen ground, Freezing, Catchment areas, Soil moisture, *Mathematical studies, Runoff, Floods, Spring flood runoff, Freeze-thaw tests.

An analysis was made on the formation of the spring flood runoff which demonstrated that for certain relationships of the temperature and moisture content of the soil, and impermeable layer can form at one depth or another. Its formation is most probable near the surface. Given the existence of an impermeable layer, its widespread distribution on the drainage basin, and lengthy existence, the losses of the spring flood runoff are as a rule small. On field drainage basins of the forest and forest-steppe zones an impermeable layer is formed rather often in the soil, and on forest drainage basins only rarely, due to the difference in the hydrophysical properties of field and forest soils. The duration of the existence of an impermeable layer depends primarily on the soil temperature or freezing depth, but the portion of the area of the drainage basin occupied by this layer depends primarily on the soil moisture content in the upper 20 centimeters. The thickness of the impermeable layer is related to the soil impermeability index, and the portion of the area of the drainage basin occupied by this layer is related to the average moisture supply in the 20 centimeter layer. The product of permeability and moisture content in this layer was taken as the integral index of meltwater runoff losses. Close relations between spring flood runoff coefficient and the loss index were obtained for field drainage basins of forest and forest-steepe zones. (Baker-FRC)

POINT PROCESS MODELS OF RAINFALL,

Johns Hopkins Univ., Baltimore, MD. Dept. of Geography and Environmental Engineering.
J. A. Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157959, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1980. 182 p, 17 Fig, 19 Tab, 72 Ref. OWRT-B-027-MD(2) and C-90308-C(0407)(1), 14-34-0001-0407, 14-34-0001-8089.

Descriptors: Simulated rainfall, Prediction, Stochastic process, *Model studies, Precipitation, Rainfall, Drought, Forecasting, Probabilistic process, *Rainfall-runoff relationships, *Low flow, *Streamflow forecasting, *Potomac River basin.

Point process models of summer rainfall for the Potomac River basin are developed for application to streamflow prediction during drought periods. The point process models that are developed include (1) a univariate point process model of rainfall occurrences at a site, (2) a marked point process model of rainfall occurrences and storm depths at a site, and (3) a bivariate point process model of rainfall occurrences at two sites. The univariate point process model of rainfall occurrences, which is denoted an RCM process (for Renewal Cox process with Markovian intensity), is the centerpiece of this dissertation. An RCM process can be described as a point process for which the rate of occurrence of events alternates randomly between two states, one of which is 0, the other positive. The notion of clustering of rainfall occurrences plays an important role in this dissertation. The form of the RCM process suggests an interpretation of clustering of rainfall occurrences based on the alternation of wet and dry periods. This interpretation is supported by presenting evidence which indicates that periods of deficit summer rainfall in the Potomac basin are closely associated with the advection of cool, dry, stable Canadian air masses.

RAINFALL-RUNOFF MODELING AND PRELIMINARY REGIONAL FLOOD CHARACTERISTICS OF SMALL RURAL WATERSHEDS IN THE ARKANSAS RIVER BASIN IN COLORADO,

Geological Survey, Lakewood, CO. Water Resources Div.
R. K. Livingston.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-224313, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-112, 1981. 43 p, 7 Fig, 9 Tab, 43 Ref.

Descriptors: *Model studies, *Flood data, *Small watersheds, *Rainfall-runoff relationships, Storm runoff, Runoff forecasting, Flood flow, Streamflow, Flood peak, Flood frequency, Regional analysis, Frequency analysis, Estimating, Hydrographs, *Colorado, *Arkansas River basin.

Both recorded and synthetic rainfall-runoff and annual peak-discharge data for 17 rural watersheds were analyzed to evaluate the magnitude, frequency, and volume of floods in the plains region of the Arkansas River basin in Colorado. Flood-frequency relations from analysis of recorded data were weighted or combined with flood-frequency relations from analysis of synthetic data to provide improved estimates of selected flood characteristics for 15 of these watersheds. The 10-, 25-, 50-, and 100-year peak discharges were regionalized using multiple-regression and station-year methods. Regression relations were developed to determine peak discharge from effective drainage area (standard error of estimate 30 to 50 percent) and flood volume from peak discharge (standard error of estimate 62 percent) for ungaged basins between 0.5 and 15 square miles in size. Using these two flood characteristics, a dimensionless hydrograph method provides synthetic hydrographs very similar in shape to recorded flood hydrographs. (USGS)

COMPARISON OF BEHAVIOR OF TWO SUB-BASINS IN THE TURTLE CREEK DRAINAGE SYSTEM,

Beloit Coll., WI. Dept. of Geology.
R. C. Stenstrom, and A. Witmer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157819, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Center, University of Wisconsin, Madison, Technical Report WIS-WRC-81-04, 1981. 29 p, 26 Fig, 1 Tab, 10 Ref. OWRT-A-091-WIS(1), 14-34-0001-0153.

Descriptors: *Agricultural watersheds, Basins, Drainage area, Drainage systems, Flood control, Floods, Precipitation, Rain gages, Rainfall, Rainstorms, *Urban watersheds, Watersheds, *Rainfall-runoff relationships, *Little Turtle basin, *Spring Brook basin, Wisconsin.

During the summer and fall of 1980 the Little Turtle and Spring Brook Sub-basins of the Turtle Creek Drainage in southern Wisconsin were studied for the response to rainfall events. Surface and subsurface characteristics of the two basins were similar, however, the shape and drainage features differed markedly. Each basin was monitored by 10 rain gauges and two recording rain gauges placed at the ends of a line running approximately east-west through the basin. Observations of three events show that in urbanized areas of Spring Brook the reduced lag time for storm runoff leads to multiple peaks from a single rainfall. Preliminary calculations indicate a larger discharge from the storm-sewered area than from the unurbanized segment of the basin, even though it represents only about 25% of the area. The response of the unurbanized segment is not as complex. However, the Little Turtle Basin, with its many tributaries, produces a multiple peaked flow from three various lag times for tributary arrivals. Because of the complexity involved, the behavior of the basins in a number of storms must be examined before a valid model can be attempted.

MATHEMATICAL MODELS OF WATER YIELD WITH PARTICULAR REFERENCE TO MISSISSIPPI WATERSHEDS, INTERIM REPORT NO. 2: MATHEMATICAL MODELING OF WATERSHED YIELD,

Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
V. P. Singh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157868, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, Mississippi State University Report, October, 1981. 50 p, 12 Fig, 5 Tab, 58 Ref. OWRT-A-129-MISS(2), 14-34-0001-1126.

Descriptors: *Watersheds, *Mathematical models, *Water yield, Antecedent moisture content, Evapotranspiration, Effective precipitation, Infiltration, Rainfall-runoff relationships, Deep percolation, Base flow, Meteorology, Soil moisture, *Mississippi, Hamon model, Haan model, TVA model, Water balance model, SCS curve number model, Singh-Dickinson model.

The objective of this project is to develop procedures for determination of daily, monthly and yearly yields of water for small natural watersheds with particular reference to the State of Mississippi. These procedures will employ simple systems analysis techniques so that they can be readily utilized in solution of practical problems relating to water resources management and development. An important aspect of this study pertains to determination of sediment yield and sediment discharge graph for a given rainfall episode. In the second year of this study an attempt was made to develop simple mathematical tools for establishing a relationship between storm runoff and the resulting sediment yield for small upland watersheds. These tools can be useful in planning and management of water resources. Currently there exists a multitude of water yield models developed in various parts of the U.S.A. A survey of these models has been made which indicates that one model is not uniformly better than the other. Each model has its strengths and weaknesses. Our aim is to synthesize those components of the models which are particularly suited for this project.

ACCURACY OF POINT PRECIPITATION MEASUREMENTS,

Danish Meteorological Inst., Copenhagen.
P. Allerup, and H. Madsen.
Nordic Hydrology, Vol 11, No 2, p 57-80, 1980. 4 Fig, 5 Tab, 12 Ref.

Descriptors: *Precipitation, *Rainfall rate, *Rainfall distribution, Gages, Wind, Rainfall area, Net rainfall, Rain gages, Measuring instruments, Wind gages, Windbreaks.

The normal-exposed Hellmann raingauge only catches 85 per cent of the true precipitation on a yearly basis. This is mainly due to aerodynamic effects. A statistical model analyzing the ratio of daily amounts of precipitation measured at ground level and at standard height is set up for describing this influence. This model relates the ratio between liquid precipitation measured at ground level and at standard height to wind speed during rain and rain intensity. It is well-suited for automatic weather stations where simultaneous measurements of wind speed and rain intensity are performed. Corrections due to liquid and solid precipitation are presented, as are corrections for different sheltered and unsheltered exposures. (Titus-FRC)

DENDROCLIMATIC ESTIMATES OF A DROUGHT INDEX FOR NORTHERN VIRGINIA,

Geological Survey, Reston, VA. Water Resources Div.
L. J. Puckett.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $3.00 in paper copy. Geological Survey Water-Supply Paper 2080, 1981. 39 p, 7 Fig, 7 Tab, 39 Ref.

Descriptors: *Dendrochronology, *Climatology, *Drought, *Precipitation, Evapotranspiration, Estimating, Hemlock trees, Sampling, Sites, Temperature, Regression analysis, Moisture stress, Moisture deficiency, Water shortage, Climatic data, *Virginia, Northern Virginia, Palmer drought severity index.

Tree-ring widths were used to calculate a 230-year estimate of the July Palmer drought severity index (PDSI) for northern Virginia. Samples of eastern hemlock were collected at three locations in northern Virginia. Annual growth increments were measured and converted to standardized indices. The response of growth to climate was determined to be positively correlated with precipitation and negatively correlated with temperature during the May-July growing season. Multiple regression was used to calculate a mathematical formula for the growth-climate relationship. Growth accounted for 20-30 percent of the PDSI variance, using the standardized indices. Factor scores of the standardized indices were only slightly better predictors of PDSI. Greatest improvement was made by using factor scores of individual trees. With this procedure 64 percent of the July PDSI variance was accounted for. Comparison of the results with a 279-year estimate of July PDSI from New York, showed agreement between low-frequency climatic trends. Analysis of the Central Mountain climatic division PDSI estimate indicated that dry years occurred most frequently during the last half the 19th and mid-20th centuries. These results are considered as first generation products, and suggest that with refined techniques more accurate estimates of prior climatic conditions will be possible. (USGS)

MEAN CHARACTERISTICS OF ASYMMETRIC FLOWS: APPLICATION TO FLOW BELOW ICE JAMS,

Iowa Univ., Iowa City. Inst. of Hydraulic Research.
M. Gogus, and J-C. Tatinclaux.
Canadian Journal of Civil Engineering, Vol 8, No 3, p 342-350, September, 1981. 12 Fig, 13 Ref.

Descriptors: *Ice jams, *River flow, Rivers, Ice, Hydraulics, Model studies, Simulation.

This study attempts to quantify the interaction between two parallel flow boundaries with different roughness characteristics. Only rigid and essentially plane boundaries are considered, to eliminate the complicating factors of sediment transport and bed form that a movable bed would have introduced. Parameters to be identified are the friction factors at both boundaries, the relative extent of the zones of influence of the boundaries as delimited by the location of the maximum velocity, average velocities in these two zones, and the shear stress or friction factors at the interface between these two zones. The study was performed in a laboratory flume. Contrary to common assumption, the location of the maximum velocity was not a point of zero shear stress when the bed and the cover had different roughness characteristics.

Semi-empirical and graphical relationships between bed and cover friction factors, relative location of maximum velocity, and bed and cover roughness sizes are presented which are sufficient to estimate the mean flow characteristics below the cover for a given flow discharge and flow depth below cover. The results of this study may be significant in calculating characteristics of river ice jams in their initial stage of formation when their roughness is significantly greater than that of the river bed. (Baker-FRC)

CLIMATIC RELATIONSHIPS OF PERMAFROST ZONES IN AREAS OF LOW WINTER SNOW-COVER,

Calgary Univ. (Alberta). Dept. of Geography.
S. A. Harris.
Arctic, Vol 34, No 1, p 64-70, March, 1981. 10 Fig, 34 Ref.

Descriptors: *Permafrost, *Snow cover, *Cold regions, Arctic, Arctic zones, Frozen ground, *Climatology, Seasonal variation, Climates, Norway, Iceland, Spitzbergen, Canada, Mongolia, Prediction, Climatic zones, Semiarid climates, Spatial variation.

This paper discusses a new method of climatic prediction for specific conditions which are fairly widespread in permafrost regions. It then examines the spatial variation of some climatic data from semi-desert to permafrost regions in parts of western North America. In areas with under 50 cm snow cover in winter, the permafrost zones show diagnostic long term freezing indices and thawing indices. The warmer boundary of the zone of continuous permafrost traverses the mean annual air temperature (MAAT) isotherm. The boundary between discontinuous and sporadic permafrost lies just on the cold side of zero degrees centigrade MAAT. The sporadic permafrost zone includes the zone of ice caves and the regions with patches of ice beneath ponds and peat bogs, extending to 5 degrees C MAAT at a thawing index of 4000 degree days per year. The relationship is applicable to Norway, Iceland, Spitzbergen, Canada and the People's Republic of Mongolia. (Baker-FRC)

ESTIMATES OF THE MAGNITUDE OF GLACIER OUTBURST FLOODS FROM LAKE DONJEK, YUKON TERRITORY, CANADA,

British Columbia University, Vancouver. Dept. of Geophysics and Astronomy.
G. K. C. Clarke, and W. H. Mathews.
Canadian Journal of Earth Sciences, Vol 18, No 9, p 1452-1463, September, 1981. 5 Fig, 7 Tab, 26 Ref.

Descriptors: *Glacial lakes, *Flood forecasting, Ice, Donjek River, Rivers, *Canada, Melt water, Runoff, *Lake Donjek.

A close examination of the probable magnitude of outburst floods which may be expected from Lake Donjek in the next 50 years has been made. Few tools exist for determining the flood potential of glacier-dammed lakes. This study began by selecting an outburst flood from a reservoir of comparable size to Lake Donjek and using this flood as a reference against which to compare predictions for Lake Donjek. In the simulation model constructed, water volume was one of several factors which influenced flood magnitude. The flood data employed resulted from the event in September 1967 when Summit Lake emptied. This lake is dammed by Salmon Glacier and empties through a 12 kilometer ice tunnel into the Salmon River. A transition occurred from stable surface drainage to unstable subglacial drainage. The December 1961 outburst flood from Summit Lake damaged the Ninemile bridge across Salmon River and an access road. There are 15 recorded outburst floods from Summit Lake. The simulation model constructed was able to reproduce the essential features of the discharge hydrogen for the September 1967 outburst from Summit Lake. The volume of Lake Donjek reservoir is currently roughly 234,000,000 cubic meters, depending on the point to which the ice margin moves during a glacier advance. The empirical Clague-Mathews formula predicts a peak discharge of 2900 cubic meters per second for Lake Donjek floods. The simulation model predicts that outburst floods from Lake Donjek are likely to be more severe than those from Summit Lake. A maximum discharge in the range of 677 to 5968 cubic meters per second is predicted. The most probable range is 3968-5938 cubic meters/second. (Baker-FRC)

SNOW BARRIER POTENTIAL FOR HARVESTING MOISTURE IN TRANSECTS ACROSS CHINOOK AREAS IN MONTANA–SUMMARY REPORT,

Montana State Univ., Bozeman. Dept. of Plant and Soil Science.
J. M. Caprio, G. K. Grunwald, and R. D. Snyder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157926, Price codes: A06 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Report No 115, September, 1981. 92 p, 24 Fig, 18 Tab, 15 Ref. OWRT-B-046-MONT(1).

Descriptors: *Soil moisture, Snow cover, Climatology, Field investigations, Lysimeters, Soil moisture retention, *Water harvesting, *Snow traps, Snowmelt, *Chinook belt, *Montana, Stubble fields.

The differential effects of snow barriers for trapping moisture in the chinook region of Montana were evaluated on standing small-grain stubble. During each of three winters treatments at each of 4 to 6 experimental sites on each of two transects included fallow and adjacent stubble areas situated in alternating north-south strips approximately 50 meters wide. Observations at each site included depth and density of snow cover, precipitation, near-surface soil moisture, depth of frozen ground, and moisture collected in mini-lysimeters. The results indicated that (1) ground froze about 20 to 30% deeper in fallow fields, (2) soil moisture in the 0-15 cm surface layer averaged slightly greater during the winter in stubble fields, (3) snow depth was greater in standing stubble and varied from 80% more during the driest winter to only about 30% more during wettest winters, (4) mini-lysimeters caught about 75% more water in standing stubble fields during the dry winter, but differences of only a few percent were noted during the wet winter, (5) snowmelt recharge efficiency (SRE) for mini-lysimeters was about 20% less in chinook areas compared to non-chinook areas during the dry year. Data from saturated mini-lysimeters in late summer indicated that evaporation is reduced about 40% by the presence of standing stubble. A model using lysimeter SRE suggests that both stubble efficiency and non-chinook efficiency vary inversely as the amount of winter precipitation. (Hunt-Mont)

COMPARISON OF AREAL SNOW STORAGE SAMPLING PROCEDURES FOR RANGELAND WATERSHEDS,

Science and Education Administration, Beltsville, MD. Hydrology Lab.
W. J. Rawls, T. J. Jackson, and J. F. Zuzel.
Nordic Hydrology, Vol 11, No 2, p 71-82, 1980. 2 Tab, 7 Fig, 15 Ref.

Descriptors: *Watersheds, *Range management, Snow sampling, Snow, *Snow surveys, Snow storage, Sampling, Snow accumulation, Old snow, Snow management, Snow depth, Snow samples, Remote sensing, Photogrammetry, Comparison studies, Reynolds Creek Experimental Watershed, *Idaho.

The accuracy of photogrammetry in determining snow depth in mountainous reangland watersheds was evaluated on a subbasin of the reynolds Creek Experimental Watershed in southwestern Idaho. Random checking of points indicated that snow depths were determined with a standard error of + or - 15 cm for a mean snow depth of 1.2 m. The lag time between the photography and the usable result and the need for a coordinated field survey make the technique a research tool. As the total watershed snow cover decreased, more samples were needed to produce the same level of accuracy. Accurately could be improved by setting a grid perpendicular to the direction of the predominant wind. (Titus-FRC)

2D. Evaporation and Transpiration

EVAPOTRANSPIRATION AND LEAF WATER STATUS OF ALFALFA GROWING UNDER ADVECTIVE CONDITIONS,

British Columbia Ministry of Environment, Kamloops.
R. J. Williams, and D. G. Stout.
Canadian Journal of Plant Science, Vol 61, No 3, p 601-607, July, 1981. 3 Fig, 1 Tab, 16 Ref.

Descriptors: *Alfalfa, *Advection, *Water potentials, Leaves, Crop yield, Plant growth, Evapotranspiration control, Evapotranspiration potential, *Evapotranspiration.

The objectives of this study were to examine the contribution of advection to evapotranspiration from alfalfa and to determine the influence of evapotranspiration on alfalfa water status. Measurements were conducted during the 1978 growing season in a field of irrigated alfalfa located near Kamloops, British Columbia, in the Thompson River valley. A potentially large heat source in the form of an oil refinery was situated to the south. Percent soil moisture data were determined gravimetrically throughout the summer at depths of 2.5, 10, 20, and 50 cm. The two sampling periods, early August and early October, both followed irrigation of the entire field. During periods of advection, actual evapotranspiration (LE) as measured by the Bowen ratio energy balance method exceeded both the net radiation and the potential evapotranspiration (PE) calculated by the physically based formula of Priestly and Taylor. During advection the net radiation was a better approximation of LE than was PE. During nonadvection periods LE was about equal to PE. It was noted that a modification of PE as designed by Jury and Tanner in 1975 for advective conditions gave favorable results during priods immediately following irrigation. Diurnal measurements revealed that the leaf osmotic potential reached a minimum by about 1200 hr and then remained constant even though LE continued at a high rate. Leaf osmotic potential measured at 0800 hr reflected soil moisture conditions. At 1400 hr, leaf osmotic potential reflected both soil moisture conditions and environmental demand. (Baker-FRC)

PRACTICAL PREDICTION OF ACTUAL EVAPOTRANSPIRATION,

International Inst. for Land Reclamation and Improvement, Wageningen (Netherlands).
P. J. Slabbers.
Irrigation Science, Vol 1, No 3, p 185-196, 1980. 7 Fig, 1 Tab, 41 Ref.

Descriptors: *Evapotranspiration, *Water potential, *Soil-water-plant relationships, Prediction, Irrigation requirements, Leaves, Soil moisture deficiency, Water use, Developing countries, Corn, Alfalfa, Soybeans, Sorghum, Wheat, Potatoes.

A simplified method is presented for predicting actual evapotranspiration. It is suitable for use in

developing countries lacking the necessary data for sophisticated techniques. A relationship is developed between a crop-dependent critical leaf water potential, potential evapotranspiration rates, and the fraction of available soil moisture at which a reduction in evapotranspiration occurs. Several simplifying assumptions are made to reduce the amount of field data required for calculations. The calculated and measured rates of evapotranspiration agreed well for maize, alfalfa, sorghum, wheat, and soybean crops, but not for potato. For crops with critical leaf water potentials above -7.5 bars, there was a 10% error in estimating the fraction of available soil moisture at which reduction in evaporation occurs. The method is not applicable for crops grown in greenhouses, hydroponics, saline conditions, root asphyxia, or extreme moisture regimes. (Cassar-FRC)

2E. Streamflow and Runoff

SURFACE WATER FLOW FROM A SOUTH FLORIDA WETLAND AREA,

Rosenstiel School of Marine and Atmospheric Science, Miami, FL. Div. of Ocean Engineering.
J. van de Kreeke, and E. Daddio.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in papercopy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol. I, October, 1981. p 232-240, 5 Fig, 4 Ref.

Descriptors: *Wetlands, *Surface flow, *Rainfall-runoff relationships, Mangrove swamps, Marshes, Water discharge, Elevation, Evapotranspiration, *Florida, Runoff.

The study site is a wetland region of approximately 5,300 acres near Marco Island in southwest Florida. Vegetation ranges from impounded mangrove wetlands on the south, to freshwater marsh, to pine, palmetto, and farm areas on the north. Elevations grade from about 0.6 m a.s.l. along the southern boundary to 1.5 m on the north. The basin has been divided into two separate hydrologic units by construction of the Belle Mead Grade. Water export was determined with a semi-empirical relationship between discharge and water elevation differences across culverts which convey surface runoff out of the study area. Monthly water export ranges from 270,000 cu m/month for November 1977 to 3,510,000 cu m/month for July 1977. The total rainfall for the one year period beginning June 1977 is 144 cm or 31,100,000 cu m for the drainage basin, of which 16,600,000 cu m was discharged through the culverts. This yields a runoff ratio of 0.53. Assuming no net water storage over a period of a year, the remaining 47% of rainfall is lost largely by evapotranspiration. (Moore-SRC)

Descriptors: *Shark River Slough, Florida, *Flow rates, *Flow discharge, *Remote sensing, Laminar flow, Spatial distribution, Water storage, Seasonal variation, Flooding, Aquatic productivity, Everglades.

The Shark River Slough originates outside and flows into the Everglades National Park. A minimum annual flow rate of 260,000 acre-feet into the park has been mandated, and, because of the slough dimensions and low hydraulic gradients, new techniques for discharge and distribution were required. A tracer dye was used in conjunction with Landsat imagery to determine sheet flow rates, spatial distribution and volumetric storage. Velocities of 0-0.035 ft/s were measured, below the detection limits of conventional instruction. When coupled with cross-sectional area calculations, a reasonable estimate of the slough's contributions to the estuarine region was 200-2000 cu ft/s. Freshwater distribution within the slough was subject to seasonal inundation fluctuating between 90,000 - 245,000 acres, providing storage estimates between 26,000 - 208,000 acre-feet for the dry and wet seasons, respectively. Such shifts in available surface water play a significant role in driving the productivity of the Everglades ecosystem. (Brambley-SRC)

DISTRIBUTION OF JOINT RUN-LENGTHS OF BIVARIATE MARKOV PROCESSES,

Technical Univ. of Istanbul (Turkey). Dept. of Hydraulic and Water Power.
M. Bayazit.
Journal of Hydrology, Vol 50, No 1-3, p 35-43, March, 1981. 3 Fig, 4 Tab, 5 Ref.

Descriptors: *Drought, *Streamflow, *Joint negative run lengths, Markov process, Rivers, Hydrology, Stochastic process, Mathematical studies, Monte Carlo method.

A theoretical expression is derived for the probability distribution of joint negative run lengths of stationary, mutually and serially dependent bivariate Markov processes. Negative run length, defined as the length of the period during which a stream flow remains continuously below a certain truncation level, characterizes a drought or dry period occurring at two locations simultaneously. It was found that the joint negative run lengths are distributed geometrically with a parameter that depends on the correlation coefficient and the truncation level. The derived equations were applied to monthly and annual flow records from two pairs of rivers (Gota and Vuoksi, Danube and Elbe) with reasonable agreement. (Cassar-FRC)

A REVIEW OF SINGLE-SITE MODELS FOR MONTHLY STREAMFLOW GENERATION,

Asian Inst. of Tech., Bangkok (Thailand).
H. N. Phien, and W. Ruksasilp.
Journal of Hydrology, Vol 52, No 1/2, p 1-12, June, 1981. 3 Tab, 18 Ref.

Descriptors: *Streamflow, *Model studies, Simulation, Computers, Standard deviation, Mathematical studies, Monthly distribution.

Models for the generation of monthly streamflows are considered and modified with a view to preserving the three important descriptors, the mean, standard deviation and skewness coefficient of each monthly sequence. In order to evaluate the four models used, the number of negative values generated and the computer time required are also considered. The four models were the Thomas-Fiering model, the First Spolia-Chander model, the Second Spolia-Chander model, and the Sen model. It was noted that monthly means and standard deviations of the historical sequences were preserved very well by all the models under study, even though a moderate size of 1000 yr was used for generated sequences. The historical records of the Mekong River are negatively skew for several months, while those of the Ping and Pasak Rivers are always positively skew. For the second model of Spolia and Chander, an unacceptable value for the skewness coefficient was obtained from the 1000 yr generated sequence. The skewness coefficient of the random component in the modified model of Spolia and Chander with a second-order autoregressive process for the residul series can be computed. In addition to being able to preserve the aforementioned descriptors of historical records, the Thomas-Fiering model is simple in parameter estimation and thus produces less negative values and consumes less computer time. Thus it is recommended for use as long as one is concerned with the preservation of the mean, standard deviation, and skewness coefficient of historical data. (Baker-FRC)

RELATIONSHIP OF THE ROUGHNESS COEFFICIENT MANNING'S N AND DISCHARGE IN AN URBAN RIVER,

University Coll., London (England). Dept. of Geography.
G. Richards, and G. E. Hollis.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 4, p 357-360, July, 1980. 2 Fig, 5 Ref.

Descriptors: *Flow discharge, *Rivers, *Field tests, *Channel flow, *Roughness coefficients, Channel morphology, Velocity, Mathematical models, Mathematical equations, Cross sections, Electronic equipment, Brent River, London, England.

Recent work has shown that the widely used Manning formula employing published values of the roughness coefficient, n, can be misleading. In a study of five large natural channels, Sargent found that as discharge increased, Manning's n decreased toward an asymptotic value as bankfull discharge was approached. In three of five reaches the observed values of n were consistently below those that would have been assumed in the absence of experimental evidence. Data from the river Brent in London is presented which confirms these criticisms and highlights the problems of characterizing channel roughness with a single value. (Titus-FRC)

THE RELATIVE INFLUENCE OF DAMS AND SECULAR CLIMATIC CHANGE ON DOWNSTREAM FLOODING, AUSTRALIA,

Macquarie Univ., North Ryde (Australia). School of Earth Sciences.
S. J. Riley.
Water Resources Bulletin, Vol 17, No 3, p 361-366, June, 1981. 2 Fig, 5 Tab, 20 Ref.

Descriptors: *Dams, *Flood frequency, *Rainfall, Flood peak, Flood recurrence interval, Warragamba Dam, Hawkesbury River, *Australia, Precipitation.

The Warragamba Dam has negligible effect on downstream flooding in the Hawkesbury River catchment, eastern Australia, according to examination of 100 years of flood records at Windsor. This dam, completed in 1960, includes 62% of the catchment and has a capacity of 2092 million cu meters. Four smaller dams (81-214 million cu meters) were built on the river in 1907, 1926, 1927, and 1935. For statistical analysis, the 100 year period was divided into five 20 year periods to detect the effect of those dams. It was established that there were no significant changes in channel depth or configuration during the past 100 years. Flood frequency was twice as great for 1939-1978 (26 yearly) as for 1879-1938 (10-17 yearly), reflecting the well-known change in seasonality and increase in total annual precipitation starting in 1940. This increased rainfall is the most important variable in determining flood regime. No significant differences in mean peak flood height or variance of flood heights were seen among the five 20 year periods. (Casser-FRC)

Descriptors: *Surface drainage, *Flood discharge, *Ephemeral streams, *Flood forecasting, *Mathematical studies, Regression analysis, Channel morphology, Gaging stations, Estimating, Runoff, Flood recurrence interval, *New Mexico, San Juan Basin.

Regression equations are presented to predict ephemeral streamflow characteristics in the San Juan Basin in northwestern New Mexico. The standard error of estimate for predicting runoff for water year 1978 using drainage area as the independent variable was 152 percent. Indications are that reliable equations for predicating annual runoff can be developed and the standard error of estimate might be reduced significantly with additional years of record. The coefficient of regression when relating drainage area to runoff for water year 1978 was significant at the 1-percent level. Preliminary results also indicate it is feasible to predict streamflow characteristics using hyrologic soil-group classifications based on runoff potential. The standard error of estimate for predicting peak discharges with recurrence intervals of 2, 5, 10, 25, 50, and 100 years using active-channel width as the independent variable averaged about 30 percent, and the regression coefficient was significant at the 1-percent level. Using drainage area to predict peak discharges resulted in a standard error of estimate that averaged about 60 percent and a regression coefficient significant at the 5-percent level. The standard error of estimate averaged about 45 percent when active-channel width and drainage area were related to peak discharges in multiple regression analyses. (USGS)

Descriptors: *Floods, Flash floods, *Storm runoff, *Washouts, Streams, Flood damage, Flood peak, Flood recurrence interval, Flood frequency, Indirect flood measurement, Flood data, *New York, *Essex County.

On November 26-27, 1979, flash flooding of several streams in Essex County, N.Y., resulted in five deaths and millions of dollars of property damage. The most severe flooding was in the headwaters of the Bouquet and East Branch Ausable river basins. Peak discharge of The Branch, the Bouquet River tributary on which a section of highway washed out, was 6,600 cubic feet per second at a measurement site 1 mile west of Elizabethtown. The exceedance probability of this discharge is estimated to be less than 0.01 (recurrence interval greater than 100 years). (USGS)

FLOODS OF MARCH 1978 IN THE MAUMEE RIVER BASIN, NORTHEASTERN INDIANA,

Geological Survey, Indianapolis, IN. Water Resources Div.
R. E. Hoggatt.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $2.50, Microfiche $3.50. Geological Survey Open-File Report 81-695, 1981. 81 p, 2 Fig, 2 Tab, 3 Ref.

Descriptors: *Floods, *Flood damage, Flood peak, *Flood data, Flood discharge, Flood recurrence interval, Flood flow, Precipitation, *Indiana, *Maumee River basin, *Fort Wayne.

Floods in the Maumee River basin in northeastern Indiana in March 1978 resulted in heavy damage in Fort Wayne and surrounding areas. Flood damage in Fort Wayne was estimated by the Mayor to be 11 million dollars. Approximately 15 percent of the city was inundated, and 2,400 of its 190,000 residents were forced to leave their homes. The estimate of damage in Adams and Allen Counties by Civil Defense officials was 44 million dollars. The Maumee River at New Haven exceeded the peak stage of record, 21.4 feet, by 2.2 feet. The peak discharge at this stream-gaging station, 22,400 cubic feet per second, was about equal to that of a 75-year flood. Recurrence intervals of peak flows on streams tributary to the Maumee River ranged from 5 to 50 years. Records of peak and daily discharges and some precipitation data are given in this report. (USGS)

SELECTING SEASONAL STREAMFLOW MODELS,

Idaho Univ., Moscow. Dept. of Electrical Engineering.
T. B. Cline.
Water Resources Research, Vol 17, No 4, p 975-984, August, 1981. 8 Fig, 7 Tab, 28 Ref. OWRT-A-065-IDA(2).

Descriptors: *Streamflow forecasting, *Model studies, *Boise River, Idaho, Correlation analysis.

Akaike's information criterion (AIC) and Kashyap's posterior probability criterion (PP) are useful in selecting a final candidate from a group of seasonal autoregressive integrated moving average models for forecasting streamflows. The criteria solve the problem of comparing models with different transformations of the observations. Monthly average streamflow on the Boise River, Idaho, is modeled using the described criteria. Results indicate that no single model selection method should be used for model building. Ideally, the correlation methods should be used for preliminary model identification and either the AIC or PP used to choose the final model. They are especially valuable for choosing between transformational classes and for resolving the trade-off between goodness of fit and parsimony. Some guidelines are: (1) for seasonal models, count parameter redundances due to cross products as unknown parameters, and (2) validate parameter estimates and candidate structures before making a final selection on the basis of minimizing the crierion. For moderate sample sizes (600 in this study) the difference between AIC and PP is consistent but small, and should not affect the ranking of candidate models. (Casear-FRC)

PROCEEDINGS AND RECOMMENDATIONS OF THE WORKSHOP ON GROUNDWATER PROBLEMS IN THE OHIO RIVER BASIN, APRIL 28-29, 1981. CINCINNATI, OHIO.

Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153354, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Center, Purdue University, West Lafayette, Indiana, Report, 1981. 104 p, 22 Fig, 20 Tab, Append. OWRT-C-90054-T(9615)(2).

Descriptors: *Surface-groundwater relations, *Groundwater potential, *Ohio River Basin, Aquifer, Groundwater management, Groundwater pollution, Symposium.

The workshop was an outgrowth of an activity by the Ohio River Basin Commission's Task Force on ground and surface water interrelationships. The task force, composed of representatives of the eleven Ohio River Basin states' Water Resources Research Centers, organized the workshop to provide an opportunity for state and federal water resource professionals to come together with the university community and representatives of industry and the private sector to examine state and regional ground water management problems and needs in the 160,000 square-mile Ohio River Basin drainage area. Presentations by state, federal, university and industry representatives focused on identification and discussion of the full range of state and regional technical and policy-related ground water management problems, provided information on related federal agency programs and research activities, and examined developments in ground water quality and quantity modeling. The principal activity of the workshop surrounded the four work group sessions held to discuss the details of specific needs and problems and to develop recommendations for action. The work groups were made up of (1) legal/institutional, (2) monitoring, (3) methods, and (4) groundwater interrelationship. The proceedings presents recommendations for action by the Commission or subsequent river basin institution.

THE GROUND WATER FLOW SYSTEM IN THE VICINITY OF MARCO ISLAND, FLORIDA,

Geraghty and Miller, Inc., West Palm Beach, FL.
V. P. Amy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, Oct. 1981. p 252-263, 4 Fig, 11 Ref.

Descriptors: *Saline water, *Groundwater movement, *Chlorides, *Unconfined aquifers, Artificial lakes, Seawater, Wetlands, Geohydrology, Evaporation, Marco Island area, *Florida.

The planned development of a coastal area near Marco Island includes the creation of a series of interconnecting lakes ranging in depth from a few feet to as much as 30 feet. Construction of these lakes will penetrate the water table aquifer in an area that is a mix of coastal wetlands and uplands. The principal goals of this study were to estimate groundwater input to the property and to investigate fresh-salt ground water relationships in the vicinity of Lake Marco Shores. Data was collected from a variety of sources: an existing network of multi-zone monitor wells on the property, new multi-zone wells, exploratory and observation wells installed by the South Florida Waters Management District, and published reports. The Pamilico Sand and the underlying limestone formations respond hydrologically as a single unit, forming a water table aquifer in the area. With the exception of the sample from well 7, water from wells tapping the principal water-bearing zone and the deep portion of the lake contained chlorides well in excess of the normal concentration of sea water. Water from wells tapping the principal zone north of the Belle Meade Grade in salty to brackish. Proceedings northeast from the Belle Meade Grade, the chloride concentration of the ground water lessens. South of the grade, water from the shallow wells ranges from 616 to 23,100 mg/l, while the shallow portions of the lake had chlorides of 3,661 mg/l. The average groundwater flow was calculated as 39.44 gallons per day per linear foot of aquifer width, or 208,000 gallons per day per linear mile. Evaporation is considered to be one of the mechanisms resulting in the formation of hypersaline groundwater. (Moore-SRC)

AQUIFER RESPONSE DUE TO ZONES OF HIGHER PERMEABILITY AND STORAGE COEFFICIENT,

Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton, and K. S. Rathod.
Journal of Hydrology, Vol 50, No 1-3, p 299-316, March, 1981. 11 Fig, 10 Ref.

Descriptors: *Permeability, *Aquifers, *Storage coefficients, *Groundwater movement, Streamflow, Recharge, Groundwater recharge, Groundwater storage, Candover Chalk catchment, Water table, Model studies, United Kingdom, *Surface-groundwater relations.

The groundwater velocities in an aquifer may be several times higher than background levels in regions of higher permeability (for example, fissures). A backward-difference finite-difference approach was developed to study these situations. A steady state problem was used to illustrate the manner in which groundwater recharge flows through the aquifer and enters a stream. the Interaction between storage and flow in an aquifer is complex, as illustrated by a one-dimensional time variant example. It is shown that a partially penetrating river can draw water from the aquifer. The Candover chalk catchment, United Kingdom, is used as an example in the model. Although the equations used do not directly include vertical flow components, the flow analysis of separate zones indicates that vertical flow components exist and are important for understanding aquifer behavior. Thus the standard regional groundwater flow equation stated in terms of transmissivity, takem as an integral of the horizontal permeabilities, infers the existence of vertical components of flow. A. B. Gureghian.
Journal of Hydrology, Vol 50, No 1-3, p 333-353, March, 1981. 16 Fig, 19 Ref.

Descriptors: *Water table, *Drainage, *Soil water, Aquifers, Ditches, Model studies, *Groundwater movement, Saturated flow, Unsaturated flow.

A 2-dimensional Galerkin finite element model was designed to predict the steady and transient saturated-unsaturated movement of water in homogeneous and nonhomogeneous ditch-drained aquifers. The parallel, equidistant ditches extend to an impermeable floor. A method for handling the nonhomogeneous boundary conditions at the seepage face for a quasi-correct prediction of the water table is discussed. Examples are presented and compared with numerical solutions for cases with incident rainfall under steady state conditions for homogeneous and layered soils. (Cassar-FRC)

THERMAL CONVECTION IN A NONHOMOGENEOUS AQUIFER,

Technion - Israel Inst. of Tech., Haifa. Faculty of Civil Engineering.
H. Rubin.
Journal of Hydrology, Vol 50, No 1-3, p 317-331, March, 1981. 7 Fig, 14 Ref.

Descriptors: *Aquifers, *Homogeneity, *Thermal properties, Thermal convection, Permeability, Geothermal studies, Heat transfer, Convection, Thermal conductivity, *Nonhomogeneous aquifers.

The effect of aquifer nonhomogeneity on thermal convection was investigated mathematically. Nonhomogeneity leads to variations in permeability and thermal conductivity of the aquifer. A large temperature difference between bottom and top of the aquifer can induce nonhomogeneity by affecting fluid viscosity and thermal conductivity of the saturated formation. Heat transfer, studied by numerical simulations, showed that the structure of the flow field and the dimensionless parameters characterizing the thermal convection may vary considerably due to aquifer nonhomogeneity. (Cassar-FRC)

EFFECT OF COLD WATER ENTRY INTO A LIQUID-DOMINATED TWO-PHASE GEOTHERMAL RESERVOIR,

Department of Scientific and Industrial Research, Wellington (New Zealand). Applied Mathematics Div.
M. A. Grant.
Water Resources Research, Vol 17, No 4, p 1033-1043, August, 1981. 6 Fig, 1 Tab, 28 Ref.

Descriptors: *Geothermal studies, *Injection, *Resources development, Geothermal resources, Pressure distribution, Saturation, Stability.

An analysis is presented of the effect of fluid withdrawal and injection into a two-phase geothermal reservoir, considering pure water-steam mixtures only. A model is presented of the geothermal reservoir matrix treated as a homogeneous medium with injected fluid mixing fully into two-phase fluid. A pressure drop is caused by withdrawal of fluid. Fluid injection causes a pressure change dependent on the fluid enthalpy and rate of injection. For cold fluid injection this is nearly always a pressure drop. The pressure disturbance and change in saturation that occur near the injection point spread through the system. A stability criterion is derived which stabilizes the two-phase fluid. Cold water intrusions occur during exploitation or can occur naturally. For example, at Wairakei, exploitation produced a sub-hydrostatic pressure profile in the two-phase zone and the vapor dominated zone. The two-phase condition is usually absent in the natural state. E. Laszlo.
Ambio, Vol 10, No 5, p 248-249, 1981. 2 Fig.

Descriptors: *Geothermal power, *Reviews, Water pollution sources, Sulfates, Chlorides, Silica, Drilling, Hot springs, Powerplants, *Thermal powerplants.

The first geothermal power production experiment began in Larderello, Italy in 1904, with steam emerging from fissures in the earth being used to generate electricity. By 1980 the total installed power capacity from geothermal sources in the world amounted to 2.5 GW. Geothermal energy arises from the radioactive decay of an isotope of potassium and other elements spread about in the earth's crust. As groundwater rarely circulates naturally below 4000 meters deep, the temperature of geothermal hot water and steam is usually below 300 degrees C, and is normally much less. Drilling and heat extraction are currently economically profitable down to about 3000 meters, but techniques should improve that figure down to as much as 5000 meters depth, thus increasing the reachable supply of available energy. High thermal gradients that ensure a heat flow to the surface are found in about 10% of the land area of the world. Low-temperature thermal energy has several uses and has the added benefit of producing only minor environmental effects compared to other energy sources when used. Even so, groundwater may become polluted with chlorides, sulfates and carbonates or silica. If the casting of geothermal boreholes is badly installed, the danger of connecting the geothermal aquifer with a freshwater horizon is greatly increased. Further problems include the release of sulfurous gases to the atmosphere and the discharge of warm water to rivers. The potential of geothermal energy would be greatly increased if heat were to be extracted from hot, dry rocks which do not naturally contain water. (Baker-FRC)

UNSTEADY FREE FLOW TO A DITCH FROM AN ARTESIAN AQUIFER,

Ahmadu Bello Univ., Zaria (Nigeria). Dept. of Civil Engineering.
M. A. Gill.
Journal of Hydrology, Vol 52, No 1/2, p 39-45, June, 1981. 4 Fig, 4 Ref.

Descriptors: *Flow, *Confined aquifers, *Groundwater movement, Ditches, Steady flow, Unsteady flow, Mathematical studies, Water level, Wells, Artesian pressure.

A mathematical model has been formulated for a freely flowing ditch under artesian conditions. A solution is obtained for the unsteady condition of flow which reduces to steady state after the lapse of theoretical infinite time. A formula for transient discharge is also given. Such a problem was first introduced in 1969 to predict the future groundwater resources of the African Sahara. At the time a system of wells was considered to be arranged in a line and well spacing was assumed to be small, so that the line of wells was replaced by a two-dimensional ditch for the sake of analysis. A similar problem was formulated in which the water level was suddenly raised at one end of the ditch while at the other end the pressure remained unaltered. In practice, the raising of water level or pressure at one end can be visualized to have been caused by the construction of a dam. The solution proposed in 1969 for the ditch problem was found inconsistent with some of the initial and boundary conditions used. The correct solution is given in this brief communication. ORIGIN OF ISOTOPIC AND GEOCHEMICAL RATIO GRADIENTS IN KARST WATER OF THE JURA MOUNTAINS. (SUR L'ORIGINE DES GRADIENTS DE TENEURS ISOTOPIQUES ET GEOCHIMIQUES DANS LES EAUX KARSTIQUES DU JURA (FRANCE)),

Franche-Comte Univ., Besancon (France). Lab. de Geologie Structurale et Appliquee.
J. Mudry.
Journal of Hydrology, Vol 50, No 1-3, p 167-178, March, 1981. 7 Fig, 1 Tab, 6 Ref.

Descriptors: *Chemical properties, *Geochemistry, *Karst hydrology, Groundwater, Isotope studies, *Jura Mountains, *France, Aquifers, Conductivity.

Isotopic gradients (O18 and tritium) and geochemical gradients (temperature, conductivity, silica, Ca, Mg, Na, K, Cl, sulfates, bicarbonates, and nitrates) were studied in the karst water of the Jura Mountains, France. Climate affected the emergent water temperature and O18 content. Lithology and pollution were responsible for geochemical gradients: K and sulfates deriving from marls and Mg from dolomites. Gradients connected with hydrodynamic properties (ionic activity, silica, and tritium) differed in aquifers with high transmissivity and aquifers with long residence time. Further, they closely followed the geologic structure (a folded zone with large structural gradient and weakly inclined table land). (Cassar-FRC)

THE IMPORTANCE OF DRIFT DEPOSIT INFLUENCES ON THE HYDROGEOLOGY OF MAJOR BRITISH AQUIFERS,

Birmingham Univ. (England). Dept. of Geological Sciences.
J. W. Lloyd.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 4, p 346-356, July, 1980. 8 Fig, 16 Ref.

Descriptors: *Hydrogeology, *Aquifers, *Deposition, *Groundwater, Base flow, Geological formations, Wells, Stratigraphy, Rivers, Sand, Gravel, Hydraulic properties, Zones, Field tests, *Great Britain.

The role of drift deposits in major aquifer hydrogeology is examined. Examples are given, indicating important hydrogeological influences exercised by drift deposits on the Chalk aquifer in Essex, Norfolk, and Lincolnshire and on the Triassic Sandstone aquifer in Lancashire and Yorkshire. In drift successions such as in Essex the frequency of lithological change in the vertical sequence is so great that the bulk horizontal permeability is orders of magnitude greater than the bulk vertical permeability. In consequence, groundwater transfer is predominantly horizontal. The gravels exercise an important storage function for the Chalk aquifer. Blow-wells are present in the Lincolnshire aquifer. These are artesian springs which enhance permeability while providing hydraulic control on saline waters. Indirect recharge through Pleistocene sands and gravels in the drift is a significant mechanism in the Triassic sandstones. Permeable drift should be considered in assessments of recharge and supply well locations. (Titus-FRC)

APPROXIMATE ALTITUDE OF WATER LEVELS IN WELLS IN THE CHICOT AND EVANGELINE AQUIFERS IN THE HOUSTON AREA, TEXAS, SPRING 1981,

Geological Survey, Austin, TX. Water Resources Div.
R. K. Gabrysch.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $2.25, Microfiche $1.00. Geological Survey Open-File Report 81-676, June, 1981. 2 Sheets, 1 Ref.

Descriptors: *Groundwater, *Wells, *Water level, *Potentiometric level, Water level fluctuations, Maps, Contours, Aquifers, *Texas, Houston area, Chicot aquifer, Evangeline aquifer.

Two maps show water levels in wells in the Houston, Texas, area in (1) the Chicot aquifer, spring 1981 and (2) the Evangeline aquifer, spring 1981. Both the Chicot and Evangeline aquifers are composed of several sand layers with different potentiometric surfaces. These maps, however, show approximations of single potentiometric surfaces that represent composite hydraulic heads. (USGS)

G. A. Hearne.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Papcer copy $6.00, Microfiche $3.50. Geological Survey Open-File Report 80-1022, September, 1980. 41 p, 17 Fig, 3 Tab, 14 Ref.

Descriptors: *Model studies, *Aquifer testing, *Simulation, *Water quality, Aquifer characteristics, Geohydrology, Wells, Withdrawal, Hydraulic conductivity, Specific yield, Storage, Chemical analysis, *New Mexico, Tesuque Formation.

An aquifer test was designed and conducted in the anisotropic dipping beds of the Tesuque Formation on the Tesuque Pueblo Grant, N.M. The three-dimensional digital model used to analyze the test approximated the response to the test. The analysis of the geohydrology of the test site in combination with the model calibration has provided estimates of average aquifer characteristics for the group of beds penetrated at the test site; the hydraulic conductivity parallel to the beds is about 2 feet per day, the hydraulic conductivity normal to the beds is about 0.0001 foot per day or lower, the specific yield is about 0.15, and the specific storage is about 0.000002 per foot. (USGS)

WATER LEVELS IN BEDROCK AQUIFERS IN SOUTH DAKOTA,

Geological Survey, Huron, SD. Water Resources Div.
W. L. Bradford.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $19.75, Microfiche $3.50. Geological Survey Open-File Report 81-627, May, 1981. 152 p, 3 Fig, 1 Tab.

Descriptors: *Groundwater, *Water level, *Wells, *Data collections, Bedrock, Aquifers, Water supply, Confined groundwater, Observation wells, Sites, Hydrographs, *South Dakota.

This report on water levels in bedrock aquifers in South Dakota is the result of a continuing investigation begun in 1959 by the U.S. Geological Survey in cooperation with the South Dakota Department of Water and Natural Resources. The purpose of the investigation is to collect data on the artesian water supply in the bedrock aquifers and to present these data in data reports that will aid in planning the use and conservation of water from these aquifers in South Dakota. The locations of wells were data have been collected are included. (USGS)

GROUND-WATER DATA FOR MICHIGAN 1980,

Geological Survey, Lansing, MI. Water Resources Div.
G. C. Huffman.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $7.75, Microfiche $3.50. Geological Survey Open-File Report 81-811, 1981. 57 p, 4 Fig, 3 Tab, 88 Ref.

Descriptors: *Groundwater, *Aquifers, *Water quality, *Wells, *Water level, Water yield, Water use, Well data, Geohydrology, Hydrographs, Water level fluctuations, Water analysis, Chemical analysis, *Michigan.

This report summarizes data on water levels in 133 observation wells and provides information on water quality, well locations, depths, altitudes, and aquifers that they tap. Tabulated data include extremes of water levels for 1980 and for the period of record. Also tabulated is the pumpage of most major ground-water users in Michigan and quality data on selected wells sampled during 1980. Ground water levels were below average in the southcentral and southeastern part of the State, but above average elsewhere. (USGS)

THE AVAILABILITY OF GROUND WATER IN WESTERN MONTGOMERY COUNTY, MARYLAND,

Geological Survey, Towson, MD. Water Resources Div.
E. G. Otton.
Maryland Geological Survey Report of Investigations No 34, 1981. 76 p, 30 Fig, 13 Tab, 35 Ref.

Descriptors: *Groundwater availability, *Hydrologic budget, *Water table, *Aquifers, Crystalline rocks, Sedimentary rocks, Groundwater movement, Geology, Observation wells, Water level, Recharge, Potentiometric level, Well yield, Precipitation, Water use, Water quality, Water management, *Maryland, *Montgomery County.

Western Montgomery County, Md., is underlain by phyllite and schist and by shale, siltstone, and sandstone. Water occurs chiefly in fractures and crevices in the rocks under water-table or modified artesian conditions. The source of all ground water is local precipitation, amounting annually to about 42 inches. Yields of several hundred wells range

from a few to 900 gallons per minute. Specific capacity, a better index of well productivity, ranges widely. The median specific capacity of 21 crystalline-rock wells is 0.18 gallons per minute per foot, and the median specific capacity of 80 wells in the consolidated sediments is 0.13, suggesting little significant difference between the two major rock types. Median transmissivity of the crystalline rocks is 35 square feet per day and the median transmissivity of the Triassic sediment is 17 square feet per day. Storage coefficients range widely, but the mean value for the Triassic sediment at the Poolesville well field is about 0.01. In 1978, well pumpage at the National Institute of Health Animal Center averaged 28,000 gallons per day; pumpage from four wells at Poolesville during 1978 averaged 246,000 gallons per day. Groundwater use in the remainder of the area is estimated to have been 250,000 gallons per day. Chemical quality of the water is suitable for most uses. Water from the crystalline rocks is mildly acidic and soft and water from the Triassic sediments is commonly mildly alkaline and has a greater hardness. Because of the relatively thin soil zone and the fractured nature of the underlying rocks, chances of polluting the aquifer are relatively great. Possible pollutants might be septic-tank effluent, road salt, chemical fertilizers, insecticides, and herbicides. (USGS)

ASSESSMENT OF EIGHTEEN PUBLIC GROUNDWATER SUPPLIES IN ILLINOIS,

Illinois State Geological Survey, Champaign.
R. W. Ringler, R. D. Brower, H. A. Wehrmann, A. P. Visocky, and C. B. Burris.
Illinois Institute of Natural Resources State Water Survey Division Contract Report No 237, July 31, 1980. 185 p. 87 Fig, 13 Tab, 5 Ref.

Descriptors: *Aquifers, *Pumpage, *Geohydrology, Groundwater storage, Data collections, Areal hydrology, Geography, Water-bearing formations, Optimal yield, Water supply development, *Aquifer management, Groundwater availability, *Illinois.

Aquifers in Illinois furnish approximately 233 mgd of water to 677 public water supplies outside the six-county area of northeastern Illinois. A total of 42 supplies known to have experienced difficulty recently in meeting water demands were selected for a detailed study of quantities pumped, aquifers developed, water resource availability, and anticipated water demand. Twenty-four were covered in an earlier report and eighteen are described here. Supplies were assessed according to the following criteria: (1) adequate supplies were those that usually required 10 hours or less pumpage to produce average daily consumption; (2) marginal supplies were those that required 10-18 hours of pumpage, or consisted of several wells with pumping rates of less than 30 gpm; (3) deficient supplies were those that required more than 18 hours, were shallow and limited in areal extent, or indicated need of additional sources of water. The detailed area-by-area narratives include geographic and geologic descriptions of the communities and their groundwater supplies, along with estimates of individual aquifer sustained yields. The most favorable groundwater conditions are in the northern third and southern tip of the state. In the central part of the state, major aquifers are sand and gravel deposits in the Mississippi and Illinois River Valleys and the buried bedrock valleys of the Mahomet, Wabash, Ohio, Kaskaskia, and Embarras rivers. GROUND WATER IN WASHINGTON,

Washington State Univ., Pullman. Water Research Center.
L. J. Martin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157892, Price codes: A03 in paper copy, A01 in microfiche. Report 40, September, 1981. 44 p, 10 Fig, 1 Tab. OWRT-A-999-WASH(7), 14-34-0001-1151.

Descriptors: *Washington, *Groundwater, *Aquifer characteristics, *Irrigation, Drawdown, Surface-groundwater relations, Water quality, Groundwater pollution, Saline water intrusion, Reviews.

This report is not intended to be a comprehensive report on ground water in the State of Washington. Nor does it represent the results of original research. Rather, it is a review of basic ground-water information for the State and a summary of some of the more serious problems occurring and anticipated in the State. Ground water is an important source of water in the State. In the more arid eastern part of the State, ground water is a major source of irrigation water for many farmers. In some of the more heavily irrigated areas, withdrawals of ground water now exceed the rate of recharge, creating serious problems as a result of the decline of ground-water levels in those areas. Throughout the State, people in rural areas depend on near surface ground water as a source of potable water. In recent years, increased concerns about protecting the integrity of the ground-water resource has fostered an increase in research on ground-water quality and protection, particularly with regard to waste disposal. There are many areas of concern to people working with the ground-water resources in the State of Washington that have either not been addressed in this report or discussed only briefly. These areas include; ground-water law and management, Indian and federal-reserved water rights, and the effects of mining and oil and gas exploration on ground-water quality. Hopefully, this report will help to point out the need for continuing and expanding research of the ground-water resources of the State.

INVESTIGATIONS OF HIGH GROUND-WATER IN POLSON TERMINAL MORAINE,

Montana Univ., Missoula. School of Geology.
G. A. Kennett, and R. R. Curry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157918, Price codes: A04 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Report No 116, Bozeman, August, 1981. 33 p, 7 Fig, 25 Ref, 14 Append. OWRT-A-119-MONT(1), 14-34-0001-9028.

Descriptors: *Groundwater, *Groundwater movement, Glacial aquifers, Glacial soils, *Moraines, Permeability, Porosity, Planning, Land development, Water table fluctuations, Water level, *Polson Moraine, Flathead Lake, Pablo Reservoir, *Montana.

High groundwater areas in Polson, Montana, are located approximately 1 mile north of a terminal moraine and 3 miles north of a storage reservoir constructed in glacial outwash. The complexities of glacially deposited material and its associated permeabilities and porosities affect groundwater movement, shrinkswell of soils and soil drainage. The intensive development of regions south of Polson will need to address potential problems relating to high groundwater. (Hunt-Mont)

REGIONAL HYDROGEOLOGIC CONCEPTS OF HOMOCLINAL FLANES,

H. E. LeGrand, and W. A. Pettyjohn.
Ground Water, Vol 19, No 3, p 303-310, May/June, 1981. 5 Fig, 14 Ref.

Descriptors: *Homoclinal flanks, *Geohydrology, *Consequent streams, Geological formations, Artesian springs, Artesian aquifers, Thermal springs, Springs, Sedimentary rocks, Coastal plains, Coastal streams, Topography, Permeability, Aquifer characteristics, Water table aquifers, Streams, Savannah River, Georgia, Aquitards, Cone of depression, Stream discharge, Structural geology, Geomorphology, Groundwater divide, *Groundwater movement, Groundwater runoff.

Homoclinal flanks, sedimentary rocks with minimum deformation, are widwspread and common hydrogeological systems. They are characterized by alternating permeable and impermeable formations, which influence regional groundwater and surface water systems in distinctive ways. Groundwater and surface water in a homoclinal flank are related by four factors: (1) agrologic structure (slightly inclined), (2) distributed of permeability (alternating bands), (3) topography (Head differences to allow water to move), and (4) climate (only humid and semiarid regions are involved). Many of the major artesian systems are associated with homoclinal flanks. Where streams cut into artesian aquifers, discharge to the stream can be considerable. It is the upper artesian aquifers which most greatly influence the hydrology of the system underlying a homoclinal flank, because water moves very slowly (several meters per century) in the lower zones. Consequent streams are especially significant. A natural cone of depression is formed at the location of a concentrated discharge area. At varying distances downstream is a stagnation zone or small groundwater divide. An example of a consequent stream is the Savannah river, Georgia. Aquifers in homoclinal flanks may feature thermal springs and artesian springs if a sufficient dip is present. The geological setting of stream stretches may shed light on the behavior of groundwater doscjarge into streams, whereas streamflow data alone is insufficient. (Cassar-FRC)

THE USE OF GROUND-WATER FLOW MODELS FOR ESTIMATING LAKE SEEPAGE RATES,

Geological Survey, Iowa city, IA.
J. A. Munter, and M. P. Anderson.
Ground Water, Vol 19, No 6, p 608-616, November/December, 1981. 11 Fig, 1 Tab, 13 Ref.

Descriptors: *Seepage, *Hydraulic conductivity, *Model studies, *Groundwater movement, Lakes, Bass Lake, Nepco Lake, Wisconsin, Lake sediments, Sediments, Aquifers, Estimating, Lake seepage rate.

Two- and three-dimensional groundwater flow models were developed to estimate seepage rates for Bass Lake and Nepco Lake, wisconsin. Bass Lake, groundwater controlled with no surface water inlet or outlet, was described by a two-dimensional profile model. Results showed that the ratio of horizontal to vertical hydraulic conductivity of the aquifer around the lake is related to both the magnitude of vertical hydraulic gradients near the lake and the distribution of seepage from the lake as a function of distance from the shore. The presence of fine-grained sediments in the littoral area can have a significant effect on lake seepage rates, but the presence or absence of fine sediments in the deep parts of the lake is relatively unimportant. Nepco Lake, created by construction of an

earthen dam, has an anomalous groundwater flow system. A three-dimensional model was far superior to a two-dimensional model for simulating the flow system around this lake. It showed that much of the lake bottom loses water. The three-dimensional model produces a much lower water table slope at a point where the influence of two creeks, receiving groundwater discharge, is noticeable. (Cassar-FRC)

SUBDOMAIN INTEGRATION MODEL OF GROUND-WATER FLOW,
California Univ., Irvine. School of Engineering.
T. V. Hromadka, II, and G. L. Guymon.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil engineers, Vol 107, No IR2, p 187-195, June, 1981. 5 Fig, 13 Ref.

Descriptors: *Groundwater, *Mathematical studies, *Finite element method, *Quantitative analysis, *Piezometric head, Flow, Unconfined aquifer, Porosity, Transmissivity, Aquifer, Mathematical equations, Confined aquifer, systems analysis, Groundwater movement.

The subdomain integration version of the weighted residuals method is applied to the linear and nonlinear equations of one-dimensional confined and unconfined groundwater flow, respectively. The approach used is to determine the spatial coordinates as a function of piezometric or free groundwater surface profiles. A simplified version of the numerical model can be accommodated by current programmable calculators. Good results are obtained when applying the proposed numerical model to the problems considered. However, several simulations were required for each problem tested, progressively reducing timestep sizes until negligible differences in computed results were observed. (Titus-FRC)

2G. Water In Soils

PREDICTION OF THE ADVANCING WETTING FRONT IN BORDER STRIP IRRIGATION,
Nairobi Univ. (Kenya). Dept. of Agricultural Engineering.
A. K. Katyal, and J. W. Kijne.
Irrigation Science, Vol 1, No 3, p 177-184, 1980. 2 Fig, 1 Tab, 16 Ref.

Descriptors: *Border irrigation, *Irrigation, *Soil water, Infiltration, Wetting, Surface irrigation, Mathematical equations, Graphical analysis.

Four methods for predicting the advance of a water front in border irrigation are compared using nine sets of published data. The Katopodes and Strelkoff (1977) method is based on the zero inertia solution and presents graphical solutions in terms of dimensionless parameters. Michael's method (1978) is based on a Laplace transformation of the water balance equation and requires values of gamma functions for solution. The Bishop et al., 1967, method uses a simple water balance equation. A new method described in this paper predicts the advance as a power-law polynomial and gives results for values of the coefficient of the exponential advance equation. The K and S method was superior to all other methods tested. The Bishop method and newly-proposed graphical approaches were fairly accurate and simple to calculate, but are not recommended for predicting advance on the wetting fronts in nearly flat border strips. The Michael method requires the most computation time. Reliable infiltration parameters are necessary for all four methods. (Cassar-FRC)

MEROMIXIS IN A COASTAL ZONE EXCAVATION,
Applied Environmental Services, Marco Island, FL.
C. M. Courtney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, October, 1981. p 219-231, 8 Fig, 11 Ref.

Descriptors: *Meromictic lakes, *Chemocline, *Mixolimnion, *Monimolimnion, *Artificial lakes, Aquifers, Stratification, Water temperature, Saline water, Storm water, Groundwater movement, Seasonal variation, *Lake Marco, Florida.

Lake Marco Shores was created as a dredge and dragline excavation in 1972, and is of particular interest because of its use as a prototype of additional proposed excavations. Over the period 28 October 1976 to 21 June 1977, seven preliminary profiles of temperature, conductivity, salinity, and dissolved oxygen were conducted in the lake. Observations indicated that Lake Marco Shores was developing a meromictic type of stability composed of three vertical strata: the mixolimnion, the chemocline, and monimolimnion. Because each of the three layers was easily definable by in situ measurement, an intensive sampling program was employed from January to December 1978 to describe changes within these layers over an annual cycle. The chemocline is formed at the depth determined by the relative rates of surface and ground water net inputs, the density difference between the mixolimnion and the monimolimnion, and the amount of energy available for mixing. The seasonal changes in temperature relative to salinity did not permit a turnover of the water column. Results suggest that coastal transition zone excavations in the area of the proposed Marco Island development can become meromictic if they are sufficiently deep so as to intersect the intruding saline ground water and if they intersect seaward discharging surface aquifers. The stability of the lake has permitted the lowest layer to accumulate nutrients, and prevented the expected stimulation of productivity. Such excavated lakes, if properly designed and located in this unique area, may represent an interesting alternative for urban stormwater treatment. (Moore-SRC)

THE EFFECT OF ENVIRONMENTAL FACTORS ON PHYTOPLANKTON GROWTH: TEMPERATURE AND THE INTERACTIONS OF TEMPERATURE WITH NUTRIENT LIMITATION,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
G. Y. Rhee, and I. J. Gotham.
Limnology and Oceanography, Vol 26, No 4, p 635-648, July, 1981. 12 Fig, 3 Tab, 40 Ref.

Descriptors: *Nutrient requirements, *Temperature, *Phytoplankton, *Growth kinetics, Algae, Scenedesmus, Asterionella, Nitrogen, Phosphorus, Algal growth, Chlorophyll a, *Lakes.

The simultaneous effects of nutrient limitation and suboptimal temperatures on growth and nutrient uptake were investigated using continuous culture techniques and the algae, Scenedesmus sp. and Asterionella formosa. Phytoplankton were also grown with sufficient nutrients to provide a baseline. The combined effects of temperature and nutrient limitation were greater than the sum of the individual effects. Decreasing the temperature increased the cell quotas of limiting and non-limiting nutrients in N- and P- limited cells, i.e., cells required more nutrient at lower temperatures. At constant temperature, cell quotas of limiting nutrients increased with the growth rate and followed a saturation function. The critical temperature (at which the growth rate is determined solely by temperature, unaffected by nutrients) was 9 C for N-limited Scenedesmus growing at 0.5 per day and 12 C for A. Formosa growing at 0.4 per day. The change of cell quota with temperature varied with the type of nutrient. These changes suggest that the ratio at which one limitation changes to the other is higher at suboptimal temperatures. In nutrient-sufficient cultures, cell quotas for C, N, and P and for chlorophyll a concentrations increased with decreasing temperature. The rate of protein synthesis per unit RNA decreased with temperature. Optimal growth range for Scenedesmus was 20-25 C and for A. formosa, 19-20 C. The highest apparent maximum N uptake occurred at 15 C for Scenedesmus growing at 0.5 per day, and for A. formosa growing at 0.4 per day, at 19-20 C. (Cassar-FRC)
W82-02221

SOME TYPES OF TEMPERATURE INVERSION ENCOUNTERED IN A FRESHWATER LAKE WITH SHORT RESIDENCE TIME,
National Water Research Inst., Vancouver (British Columbia). Pacific and Yukon Region.
R. C. Wiegand, and E. C. Carmack.
Limnology and Oceanography, Vol 26, No 3, p 565-571, May, 1981. 3 Fig, 1 Tab, 27 Ref.

Descriptors: *Thermal stratification, *Lakes, *Temperature effects, Mixing, Turbidity, Seasonal variation, *Kamloops Lake, *British Columbia, Water circulation, Temperature inversion.

Temperature inversions in freshwater lakes can be distinguished by lake location, season, and the physical mechanism of generation. A year-long study was made of Kamloops Lake, British Columbia, a short residence time lake whose seasonal circulation patterns are dominated by the Thompson River. Some 1650 temperature/turbidity profiles were taken. About 230 of these exhibited inversions greater than 0.05 deg C and of vertical thickness greater than 1 m. Inversions fell in these general categories: inlet region, turbidity currents, cabbeling, open lake (shear effects), open lake (surface effects), and outlet region (summer). For one example, potential energy considerations were used to calculate the minimum amount of work done on the water column to produce the observed deformation. (Small-FRC)
W82-02224

FREQUENCIES OF DEVELOPMENTAL MORPHS OF CHAOBORUS AMERICANUS IN FOUR FISHLESS BOG LAKES,
Northern Illinois Univ., DeKalb. Dept. of Biological Science.
C. N. Van Ende.
American Midland Naturalist, Vol 105, No 2, p 401-404, April, 1981.

Descriptors: *Zooplankton, *Bogs, *Lakes, *Temperature effects, Wetlands, Midges, Plankton, Population dynamics, Ecology.

Four bog lakes, located at the University of Notre Dame Environmental Research Center, were sampled for fourth instar larvae of the phantom midge Chaoborus americanus. The percentages of fast-developing morphs found were 92.9, 98.3, 19.6 and 39.2 in the different lakes. These values did not correlate with lake temperature regimes. Lake temperatures were, however, correlated with the rate of pupation of fast developing morphs. The inconsistency of the pupation patterns in these lakes suggests that the system is complex and that factors other than the previous spring's weather may be equally important in determining the frequency of morphs in a lake. For example, cannibalism may be important. Community structure may also be significant in determining the amount of cannibalism. (Baker-FRC)

FACTORS CONTRIBUTING TO THE MAINTENANCE OF OLIGOTROPHY IN AN ALPINE GLACIAL MORAINE LAKE (WALLOWA LAKE) IN NORTHEAST OREGON,
Corps of Engineers, Portland, OR.
D. W. Larson.
Northwest Science, Vol 55, No 2, p 95-107, 1981. 1 Fig, 7 Tab, 24 Ref.

Descriptors: *Limnology, *Wallowa Lake, *Oligotrophic lakes, Alpine regions, Water quality, *Oregon, Irrigation effects, Recreation demand, Salmon.

The limnology of Wallowa Lake, Oregon, was studied, and lake quality and eutrophication were investigated by yearly surveys in 1966-1972. Wallowa Lake is fed chiefly by the Wallowa River; it is about 6.5 km long and 1.0 to 1.5 km wide, with a surface area of 7.9 sq km. The lake and the river are relatively unpolluted and do not suffer dense, sustained algae blooms. Concentrations of nitrogen, phosphorus and BOD were found to be relatively low, and dissolved oxygen was abundant. Major ion concentrations, total alkalinity, total hardness, and specific conductivity all were low. The pH was 7.4-7.8 at four stations sampled in June and August, 1973. The lake may experience problems in the future if not managed carefully. It is subjected to intense recreational use. Also, the watershed is relatively barren, with nutrient impoverished soils. The climate is rigorous and the lake has a steep, deep morphometry. Area subdivisions generally lack proper sewage treatment, but sewage inputs are few and widely spaced. Irrigation releases cause nutrient removal by substantial lake drawdown in summer. The lake is replenished with low temperature, low nutrient water, which may contribute to its pristine, oligotrophic environment. (Small-FRC)

METABOLISM OF A FLORIDA LAKE ECOSYSTEM,

Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
T. D. Fontaine, III, and K. C. Ewel.
Limnology and Oceanography, Vol 26, No 4, p 754-763, 1981. 5 Fig, 2 Tab, 24 Ref.

Descriptors: *Productivity, Respiration, *Aquatic plants, Phytoplankton, Algae, Lakes, *Plankton, *Little Lake Conway, *Florida, Macrophytes, Photosynthesis, Seasonal variation, Tropical regions, Ecosystems.

The ecosystem and plankton metabolism were studied for a year during 1976 in Little Lake Conway, Florida. This lake, part of a multilobed lake system near Orlando, is enriched in nutrients and has an organic bottom sediment and zones of rich macrophyte growth. Ecosystem production and respiration did not vary much throughout the year. Gross production and respiration were 3071 and 3180 g O2 per sq meter per year, respectively. Plankton accounted for 44% of the gross production and 54% of the annual respiration, submersible macrophytes and epiphyton for the remainder. Maximum productivity in this lake occurred near the hydrosoil. During June-July respiration and production in submersed plants and epiphytes were minimal, possibly due to the higher temperatures. This data does not contradict the hypothesis that cycles of ecosystem gross production and 24-hour respiration become increasingly balanced and synchronous with decreasing latitude. (Cassar-FRC)

THE DILUTION/FLUSHING TECHNIQUE IN LAKE RESTORATION,

Washington Univ., Seattle. Dept. of Civil Engineering.
E. B. Welch.
Water Resources Bulletin, Vol 17, No 4, p 558-564, August, 1981. 2 Fig, 2 Tab, 15 Ref.

Descriptors: *Lake restoration, *Flushing, *Costs, Nutrients, Algae, Rehabilitation, Eutrophication, Moses Lake, Green Lake, *Washington.

The theoretical basis for dilution/flushing techniques is discussed, followed by a summary of results of applications at Moses Lake and Green Lake, Washington. These eutrophic lakes were diluted with water low in nitrogen and phosphorus, and lake nutrient content dropped. Dilution or flushing rates were about 10 times normal during the spring and summer period in Moses Lake and three times the annual rate for Green Lake. Moses Lake experienced a 50% improvement in water quality, and even greater improvement resulted in Green Lake. In this case, the cost of water transport was minimal, but this cost could be very important at a different application site. If only high nutrient water is available for flushing, improvement may still result from algal cell washout and water column instability. Dilution/flushing can be considered as an effective technique for restoring eutrophic lakes, especially if low nutrient water is available. (Small-FRC)

SEASONAL AND DIURNAL FLUCTUATIONS OF OOMYCETE PROAGULE NUMBERS IN THE FREE WATER OF A FRESHWATER LAKE,

Reading Univ. (England). Plant Science Lab.
I. C. Hallett, and M. W. Dick.
Journal of Ecology, Vol 69, No 2, p 671-692, July, 1981. 12 Fig, 5 Tab, 47 Ref.

Descriptors: *Seasonal variation, *Aquatic fungi, *Lakes, Water quality, Microbiological analysis, Diurnal distribution.

The reliability and amplitude of oomycete propagule numbers in a natural environment were determined by constant flow centrifugation. A method of estimating the numbers of fungal propagules using continuous flow centrifugation, pour plating and scanning was tested on samples collected from a small freshwater lake. The loss of viable propagules for zoospores and zoospore cysts ranged from 5 to 26%. In the lake samples, there was a seasonal periodicity in propagule numbers, with maxima in spring, early summer, and autumn. There were diurnal maxima in early afternoon and late evening. No single factor was isolated that could explain the variations. Lakewater zoospores have a short lifespan; thus the per unit volume of zoospores recovered may be indicative of the activity of the fungi. (Small-FRC)

EFFECTS OF WATER-TABLE CONFIGURATION ON SEEPAGE THROUGH LAKEBEDS,

Geological Survey, Denver, CO.
T. C. Winter.
Limnology and Oceanography, Vol 26, No 5, p 925-934, September, 1981. 6 Fig, 18 Ref.

Descriptors: *Water table, Groundwater movement, *Lakes, Mathematical models, *Lake beds, Influent seepage, *Seepage, Wetlands.

The importance of the slope of the water table near a lake and beyond the lake's immediate watershed on the role of groundwater in the hydrologic and chemical balances of lakes was investigated. The finite-difference groundwater flow model of the US Geological Survey was used. The numerical analysis indicated that the slope of the water table beyond a lake's immediate drainage basin, particularly between a water-table mound on the lake's downgradient side and a regional groundwater discharge area, can have a significant effect on seepage. In two hypothetical settings, water-table slopes greater than or equal to 0.010 in this segment of the water table can cause seepage from the lake. Groundwater discharge may be a mechanism for the occurrence of upland-type wetlands near breaks in the water-table slope. In the glacial Lake Agassiz plain in northwestern Minnesota, groundwater discharge occurs along the east edge of the lake plain where the steep water-table slope in the end moraine meets the very low slope of the water table. SUMMER POPULATION FLUCTUATIONS, FEEDING, AND GROWTH OF HYDRA IN AN ARCTIC LAKE,

North Carolina State Univ., Raleigh. Dept. of Zoology.
B. E. Caker, and S. C. Mozley.
Limnology and Oceanography, Vol 26, No 4, p 697-708, July, 1981. 9 Fig, 22 Ref.

Descriptors: *Hydra, *Arctic, *Population dynamics, Lakes, *Toolik Lake, *Alaska, Invertebrates, Crustaceans, Copepods, Adaptation, Predation.

Population dynamics of Hydra in the rocky littoral zone of Toolik Lake, Alaska, were similar to those of Hydra in temperate lakes with the exception of a higher rate of increase in biomass at comparable temperatures (0.53 mg per mg per day at 10 C and 0.31 mg per mg per day at 11 C). This indicates a metabolic adaptation to Arctic conditions. During the 1977 study, the population density increased from June to a maximum in late July or early August, corresponding to the availability of food (Bosmina and copepods). Although food resources continued to increase in August, Hydra populations stabilized or decreased, probably as a result of predation, displacement by epilithic algae, and/or emigration. The peak population of Hydra (135 per sq meter) consumed 1630 Bosmina per sq m per day, or 12 Bosmina per Hydra per day. This accounted for 10% of the standing crop in the lake. Bosmina comprised 93% of the food found in Hydra guts. (Cassar-FRC)

SOME ANALYSES OF AQUATIC PLANTS AND THEIR WATERS,

Crewe and Alsager Coll. of Higher Education (England).
K. G. Allenby.
Hydrobiologia, Vol 77, No 2, p 177-189, 1981. 9 Tab, 7 Ref.

Descriptors: *Aquatic plants, *Chemical composition, *Minerals, Water analysis, Chlorides, Sulfates, Phosphates, Potassium, Calcium, Sodium, Nitrogen.

Several inorganic components of internal tissue and external incrustations of aquatic plants and their surrounding waters were determined. Dilute HCl was used to remove the external incrustations. Average analyses were: chloride, 0.76-4.8%; sulfate, 0.70-2.23% (total) and 0.50-1.65% (internal); phosphate, 0.68-2.56% (total) and 1.47-1.83% (internal); Ca, 0.63-3.86% (total) and 0.76-2.24% (internal); Na, 0.44-1.13 (total) and 0.25-1.17% (internal); K, 1.69-3.30% (total) and 0.88-3.1% (internal); and total N, 2.4-4.3%. There was no correlation between concentrations of the minerals in the water and concentrations in the plant for chloride, sulfate, phosphate, Ca, K, or Na. Generally, aquatic species were two to three times higher in chloride, sulfate, and phosphate content than terrestrial species. The average external incrustation was 50% Ca, 19% K, 14% phosphate, 11% sulfate, and 5% Na. (Cassar-FRC)
W82-02293

QUANTITATIVE DIFFERENCES BETWEEN BENTHIC ALGAL COMMUNITIES ALONG A DEPTH GRADIENT IN LAKE MICHIGAN,

Michigan Univ., Ann Arbor. Great Lakes Research Div.
R. J. Stevenson, and E. F. Stoermer.
Journal of Phycology, Vol 17, No 1, p 29-36, March, 1981. 10 Fig, 1 Tab, 27 Ref.

Descriptors: *Algae, *Benthic flora, *Distribution patterns, Lakes, Phytoplankton, *Lake Michigan, Wave action, Cyanophyta, Diatoms, Population density, Water depth, Water analysis, Vertical distribution.

Benthic algae were examined at five depths in eastern Lake Michigan. Three zones were obvious on the basis of community composition, structure, and abundance: shallow (6.5 m), mid-depth (9.1 and 14.6 m), and deep (22.6 and 27.4 m). There was a diverse algal assemblage with 255 taxa representing 36 genera. Only live cells were counted, according to a technique developed as part of this study. It used a mounting medium of high refractive index. Diatoms were dominant, and substantial numbers of blue-green algae were present in the benthic algal communities. The shallow communities showed dominance of benthic species, high diversity, and low abundance, reflecting the disturbance of wave action. The mid-depth communities were also dominated by benthic species and had high diversity, but abundance was high because wave effects were less. The deep communities featured planktonic algae because light intensi-

ty limited growth of benthic species; diversity and abundance were low. (Cassar-FRC)

THE PATTERNED MIRES OF THE RED LAKE PEATLAND, NORTHERN MINNESOTA: VEGETATION, WATER CHEMISTRY, AND LANDFORMS,

Minnesota Univ., Minneapolis. Limnological Research Center.
P. H. Glaser, G. A. Wheeler, E. Gorham, and H. E. Wright, Jr.
Journal of Ecology, Vol 69, No 2, p 575-599, July, 1981. 5 Fig, 2 Tab, 74 Ref.

Descriptors: *Vegetation, *Water quality, *Peat bogs, *Fens, Chemical composition, Hydrogen ion concentration, Conductivity, Calcium, *Red Lake, *Minnesota, Drainage effects.

A study was performed to classify the major vegetational types of the Red Lake Peatland (Minnesota), to determine the relationships of the vegetation to major landforms and their water chemistry, and to investigate the possibility of currently changing vegetational forms. In raised bogs and ovoid islands where waters were of low pH, low Ca(+2) concentration, and low conductivity, two types of vegetation occurred. On strings, flats and teardrop islands which were characterized by high pH, low Ca(+2) concentration, and low conductivity, three types of fen vegetation were found. Poor fens occurred where waters had intermediate pH ranges, Ca(+2) concentrations, and conductivities. Surface drainage seemed to be important in the maintenance of mire patterns, as drainage ditches had localized effects on vegetation and landforms. (Small-FRC)

THE RECOLONIZATION OF LAKE TAHOE BY BOSMINA LONGIROSTRIS: EVALUATING THE IMPORTANCE OF REDUCED MYSIS RELICTA POPULATIONS,

Oklahoma Univ., Kingston. Biological Station.
S. T. Threlkeld.
Limnology and Oceanography, Vol 26, No 3, p 433-444, May, 1981. 6 Fig, 3 Tab, 30 Ref.

Descriptors: *Zooplankton, *Population dynamics, *Lake Tahoe, Predation, Annual distribution, Aquatic animals, Aquatic populations, *Bosmina longirostris.

Bosmina longirostris reappeared in Lake Tahoe after an absence of more than three years. Demographic analyses and feeding experiments suggested that predation by Mysis relicta, which was introduced to the lake, may have been responsible for Bosmina's decline and disappearance. Bosmina reappeared when there was a reduction in Mysis relicta from about 380/sq m. Other factors including biological and physical influences may have had more to do with the reappearance of Bosmina than the reduction in Mysis. Considerable annual variation occurs in Lake Tahoe plankton dynamics, predator assemblages, and in interactions between the littoral and pelagial. Bosmina may have been reintroduced by wind-induced advection from Emerald Bay. (Small-FRC)

THE EFFECT OF ENVIRONMENTAL FACTORS ON PHYTOPLANKTON GROWTH: LIGHT AND THE INTERACTIONS OF LIGHT WITH NITRATE LIMITATION,

New York State Dept. of Health, Albany. Division of Labs. and Research.
G. Y. Rhee, and I. J. Gotham.
Limnology and Oceanography, Vol 26, No 4, p 649-659, Jul, 1981. 9 Fig, 2 Tab, 26 Ref.

Descriptors: *Nutrient requirements, *Light intensity, *Phytoplankton, *Growth kinetics, Lakes, Algae, Algal growth, Nitrates, Scenedesmus, Fragilaria, Nitrogen, Phosphorus, Chlorophyll a.

The combined effects of light and nutrient limitation in growth of Scenedesmus sp. and Fragilaria crotonensis were studied with continuous culture systems. The combined effects were greater than the sum of the individual effects. Nutrient requirements increased with decreasing irradiance. When N was limiting, the cell quota of the limiting nutrient increased as irradiance decreased for a constant growth rate and subsistence quota. Thus, within a certain range of growth rates, light and nitrogen cell quota can compensate for each other in maintaining the growth rate. When nutrients were not limited, decreasing light below saturation increased the cell quotas of C, N, and P and the chlorophyll a concentration. Cell quotas of nonlimiting nutrients in nutrient-limited cultures are the maximum that can be reached at a given irradiance. (Cassar-FRC)

PRODUCTIVITY OF FOUR MARSH SITES SURROUNDING LAKE PONTCHARTRAIN, LOUISIANA,

Louisiana State Univ., Baton Rouge. Coastal Ecology Lab.
G. W. Cramer, J. W. Day, Jr., and W. H. Conner.
American Midland Naturalist, Vol 106, No 1, p 65-72, July, 1981. 3 Fig, 2 Tab, 23 Ref.

Descriptors: *Marshes, *Primary productivity, *Aquatic plants, Wetlands, Lake Pontchartrain, *Louisiana, Productivity, Nutrients, Spartina, Vegetation, Decomposition, Tidal marshes, Salinity.

Net primary production and nutrient concentrations were studied from February 1978 to March 1979 at Spartina patens marshes near Lake Pontchartrain, Louisiana. The four sites varied in salinity (< 1-4.5 ppt), mean tidal range (0-12 cm), and nutrient levels. Vegetation was harvested over the annual cycle at 3-6 week intervals from five 0.1 sq meter quadrats chosen at random in each marsh. Primary production was calculated at 2541-4411 g dry weight per sq meter per year using Smalley's method based on changes in live and dead standing crop between sampling times and 3053-5509 g dry weight per sq meter per year by the Weigert and Evans method based on weight loss of vegetation exposed in nylon mesh bags. Live standing biomass increased from a low in February at all sites to a peak occurring from as early as June to as late as November, depending on the site. After 6 months 35-47% of the vegetation had decomposed. Higher productivity and decomposition rates occurred at sites with higher nutrient levels and free tidal flushing. Salinity was not a factor in productivity. (Cassar-FRC)

THE THERMAL RESPONSE OF LAKE OHRID, YUGOSLAVIA TO METEOROLOGICAL CONDITIONS,

Michigan Univ., Ann Arbor. Dept. of Geography.
S. I. Outcalt, and H. L. Allen.
Archiv fur Hydrobiologie, Vol 91, No 1, p 181-191, May, 1981. 1 Fig, 17 Ref.

Descriptors: *Temperature gradient, *Water circulation, *Meteorological data collection, Lakes, *Lake Ohrid, *Yugoslavia, Epilimnion, Hypolimnion, Water temperature, Stratification, Thermal stratification, Mixing, Lake circulation, Wind, Model studies.

The thermal regime of Lake Ohrid, Yugoslavia, was modeled from meteorological data (daily sunshine duration, mean daily wind velocity, air temperature, relative humidity, and cloud cover). Predicted data were compared with measured water temperature profiles at 13 depths to 240 m. The model, which uses a simple thermal-diffusion-density mixing algorithm, predicted the thermal regime of the lake to a considerable degree. However, there were significant discrepancies between predicted and measured structures in the epilimnion and thermocline during spring-summer warming, the thermocline depth and epilimnion temperatures being underestimated. The simulated hypolimnion temperatures were several tenths of a degree colder than the observed temperatures. The thermal regime of this lake is probably the product of a thermal-density mixing mechanism similar to the proposed model. Wind mixing does not appear important in establishing the annual thermal regime. (Cassar-FRC)

INFRARED ABSORPTION STUDY OF HUMIC SUBSTANCES FROM LAKE APOPKA SEDIMENT, PLANKTON AND THE SURROUNDING DRAINAGE BASIN,

Florida Inst. of Tech., Melbourne. Dept. of Environmental Engineering and Science.
T. V. Belanger.
Florida Scientist, Vol 44, No 2, p 72-78, 1981. 2 Fig, 3 Tab, 12 Ref.

Descriptors: *Eutrophication, *Measuring instruments, Infrared spectroscopy, Spectroscopy, Absorption, Humic acids, Organic matter, Catchment areas, *Plankton, Lakes, *Lake Apopka, *Florida, Muck soils.

Infrared methods were used as a limnological tool to evaluate characteristics of humic substances from bottom sediments and sediment from the watershed surrounding Lake Apopka, 24 km west of Orlando, Florida. The lake is large (12,140 ha) and shallow (2 meters), and was once known for its clear waters and good bass fishing. The lake has become hypereutrophic and is now populated by blue-green algae, floating mats of water hyacinths, shad, and brown bullheads. Unconsolidated silt, muck, and peat cover over 90% of the lake bottom. The muck and decaying organic matter is very flocculent and ranges in depth from 0.3 to 12.3 meters throughout the lake. Most of the soils surrounding the lake are well-drained sands suited for citrus production. A muck farm area is located primarily on the north shore of the lake, below lake level, and was once lake bottom. This muck farm area comprises 7.280 ha of nutrient-rich organic soil devoted to vegetable cropping agriculture. The nutrient rich irrigation water must be periodically pumped from the muck farm into the lake, and has been blamed for much of the lake's rapid deterioration. Infrared absorption spectra of 1540 and 1650 cm(-1) peaks in plankton and lake sediment samples, in addition to other spectral similarities, indicate that plankton is the probable precursor of the lake sediment humic substances. These absorption bands are thought to be due to peptide bonds in protein, with amide I absorption occurring at 1650 and amide II at 1540 cm(-1). The spectra from the muck farm soil and citrus soil differ to a greater extent from the spectrum of the lake sediment than do the plankton spectra. (Baker-FRC)

TROPHIC CHANGES WITHOUT CHANGES IN THE EXTERNAL NUTRIENT LOADING,

Goeteborg Univ. (Sweden). Dept. of Zoology.
L. Henrikson, H. G. Nyman, H. G. Oscarson, and J. A. E. Stenson.
Hydrobiologia, Vol 68, No 3, p 257-263, February, 1980. 7 Fig, 23 Ref.

Descriptors: *Oligotrophic lakes, *Productivity, *Nutrients, Trophic level, Fish, Grazing, Predation, Zooplankton, Phytoplankton, Lilla Stockelidsvatten, *Sweden, *Water quality, Fish removal.

Removal of the fish population from an oligotrophic lake produced biotic changes and abiotic changes which altered water quality parameters in an oligotrophic direction. The dominant zooplankton changed from cladocerans to large copepods;

dominant phytoplanktons changed from smaller to larger species. Abiotic changes from 1973 to 1973 to 1977 were as follows: limnetic primary production, 10.7 to 1.5 mg per cu meter; transparency, 1-3 meters to 4-7 meters; pH, 8 to 7; total phosphorus, 13.5 to 7 micrograms per liter; and total nitrogen, 640 to 450 micrograms per liter. The transparency and pH of a control lake remained stable during the study period, which transparency and pH of a control lake remained stable during the study period, which eliminated the possibility of large scale environmental effects. Some of the reasons for the biotic changes were: the lower productivity of larger-celled phytoplankton compared with smaller-celled phytoplankton, increased grazing pressure from the larger herbivores on the smaller phytoplankton size interval, lowered rate of mineralization via zooplankton, and decreased impact of nutrients from areas outside the pelagic zone. pH decreases resulted from changes in CO2 content. Transparency increases and N and P decreases reflect the decrease in organic particulate matter. (Cassar-FRC)
W82-02367

WIND-INDUCED MIXING IN STRATIFIED FLUID,

Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.
C. Kranenburg.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY5, p 632-637, May, 1981. 21 Ref.

Descriptors: *Mixing, *Wind, *Stratification, Model studies, Mathematical models, Hypolimnion.

A simple model is presented for mixed-layer deepening caused by wind action at the free surface of a density-stratified fluid. A streamwise pressure gradient is considered; solar radiation, cooling, advection, and Coriolis effects are disregarded. When certain modeling assumptions are used, the turbulent energy equation yields a dimensionless entrainment rate inversely proportional to the overall Richardson number. One of these assumptions, that the net kinetic energy input is proportional to the cube of the friction velocity related to the shear stress exerted by the wind, has been criticized. According to a new assumption, the overall Richardson number was assumed to be constant. The findings obtained may be explained, starting from a two-layer-structure of the mixed layer, wherein the upper layer is homogeneous and the lower transition layer displays near-critical conditions, i.e., the turbulence is nearly collapsing. The results obtained from the mathematical considerations agree at least qualitatively with observations, and corroborate the concept that density distributions alone can cause the difference between the layers. The flow in the mixed layer was found to be supercritical. (Cassar-FRC)

TROPHIC STRUCTURE AND ENERGY FLOW IN A TEXAS POND,

PETRA Inc., Denton, TX.
W. M. Childress, L. C. Fitzpatrick, and W. D. Pearson.
Hydrobiologia, Vol 76, No 1/2, p 135-143, 1981. 3 fig, 5 Tab, 33 Ref.

Descriptors: *Trophic level, *Ponds, Energy, Annual distribution, *Texas, Primary productivity, Food chains, Aquatic organisms, Respiration.

The trophic structure of a Texas pond is described, and a general model of energy flow through the community is presented. The pond is located on the southwest edge of Denton, Texas. Water sources are runoff from a 10 ha watershed and a well, 200 meters deep into the Trinity sandstone. Surface area during the study ranged from 8,313 to 10,566 square meters. Mean and maximum depths were 2.5 and 3.5 meters, respectively. Water temperature ranged from 4 to 33 degrees C, with mean of about 20 degrees C. Runoff from an adjacent golf course contained grass clippings, leaves and fertilizers together with dust from a nearby unpaved road, yielding abundant allochthonous materials to the pond. Preliminary work identified four major components of the pond community: primary producers such as algae and vascular plants, microcrustacean zooplankton, benthic invertebrates, and fish. These four major groups were described in terms of energies of consumption, respiration, predation, losses to sediments and decomposers, and emigration. Annual primary production was 7,780 kcal/square meter/year for a production-respiration ratio of 1.49. Climax communities are usually thought to have a production-respiration ratio close to 1.0. A new surplus of about one third of the primary production was apparently deposited on the substrate. Energetics were partitioned into four trophic levels for determination of ecological efficiencies. Resulting efficiencies were 26.6% for primary producers, 4.69% for primary consumers, and 7.34% for secondary consumers. The pond ecosystem had greater energy flow through the upper levels than reported for other systems in the literature. (Baker-FRC)

DIEL CHANGES IN PLANKTON AND WATER CHEMISTRY IN WICKEN BRICKPIT,

Cambridge Univ. (England). Dept. of Applied Biology.
S. A. Corbet, R. M. S. Perrin, D. r. Hartley, P. D. Lancashire, and H. A. F. Mace.
Hydrobiologia, Vol 74, No 3, p 249-271, September, 1980. 10 Fig, 5 Tab, 45 Ref.

Descriptors: *Zooplankton, *Nutrients, *Diel variations, Plankton, Phytoplankton, Ponds, Water quality, Vertical distribution, Migration, Wicken Brickpit, Copepods, Cladocerans, Water depth, Dinobryon, Lake Poukawa, *New Zealand.

Diel variations in plankton activity and water chemistry were studied with water samples taken at 1.5 to 3 hour intervals for a 24 hour period starting at noon (1200 hours) August 1, 1977 at Wicken Fen, Cambridgeshire. Supplemental observations were taken on other dates. The marked variations with depth and time suggest that conclusions based on single water samples should be evaluated with caution. Temperatures at 25 cm ranged from 20C to 24C and at 225 cm, from 17.5 to 18C. Dissolved oxygen at 25 cm was highest at 1820-2230 hours and lowest in the morning; it varied greatly with photosynthetic activity. Dinobryon and dinoflagellates were dominant down to 190 cm and remained within this zone throughout the study. Dinobryon spent the day at 50 cm and at 1800-2100 hours moved 20 cm deeper, ascending again at 0600 to 0900 to the daytime level. Dinoflagellates remained at 50 cm from 1800 to 2400, moving down to 150 cm between 0600 and 0900 hours and rising at midday to 50 cm. Zooplankton, mainly copepods and cladocerans, migrated vertically according to time of day and species. The temporal segregation at a given level implies interspecific competition. Inorganic constituents (ammonium N, total oxidized N, reactive phosphate, and silica) had greater variations at the 225 cm depth than at 25 cm depth. The transient peaks in nutrient concentrations observed near the surface may be attributed to nutrient release by zooplankton feeding at greater depths. Similar results were obtained from a 24 hour study of water in Lake Poukawa, New Zealand, on January 9-10, 1979. (Cassar-FRC)

PRIMARY PRODUCTIVITY AND TROPHIC STATUS OF A KASHMIR HIMALAYAN LAKE,

Kashmir Univ., Srinagar (India). Dept. of Botany.
M. A. Khan, and D. P. Zutshi.
Hydrobiologia, Vol 68, No 1, p 3-8, January, 1980. 4 Fig, 2 Tab, 18 Ref.

Descriptors: *Trophic level, *Lake classification, *Primary productivity, Mesotrophic lakes, Lakes, Himalayan Mountains, Naranbagh Lake, *Kashmir, *India, Phytoplankton, Productivity, Water quality.

Naranbagh Lake (34 degrees 12 min N and 74 degrees 41 min E; altitude 1587 meters; area 24.3 ha) in the Kashmir Himalayan Mountains is still mesotrophic according to the 1975-76 yearly phytoplankton production rates, estimated at 134 g C per sq meter. Primary production of phytoplankton, measured by the C14 technique, ranged from 36 mg C per sq meter per day in December to 906 mg C per sq meter per day in July. Photosynthetic efficiency was 0.02-0.48%. Secchi transparency varied from 1.25 to 4.0 meters, and extinction coefficient, from 0.42 to 1.36. Phosphate levels were 6.5-24.5 micrograms per liter and nitrates, 30-55 micrograms per liter. (Cassar-FRC)

S. A. Thorpe, and A. J. Hall.
Journal of Fluid Mechanics, Vol 101, No 4, p 687-703, December, 1980. 6 Fig, 32 Ref.

Descriptors: *Lakes, *Mixing, *Turbulent flow, Thermocline, Water circulation, Weather, Boundary layers, Temperature effects, *Loch Ness, Scotland.

The near-surface mixing layer was examined in one of the largest freshwater lakes in Scotland, Loch Ness. Large-scale coherent structures were identified in the turbulent mixing layer. Data collected by several sensors indicated the presence of downward-moving warm water of near surface origin with greater than average horizontal velocity separated by narrow tilted interfaces or fronts, from slower moving, colder water. Turbulent diffusion is indicated by the presence of frequent inversions in the vertical temperature profiles in the region between the fronts. Local Richardson numbers indicate that the fronts are only marginally unstable, if unstable at all, and it is not clear whether the descent of fluid towards the thermocline at increased speed will so increase the shear that the thermocline will become locally unstable. More careful observations of mixing layers are needed to determine the mechanisms at work. It is clear that in many respects, this mixing layer is similar to the near-surface atmospheric boundary layer. (Small-FRC)

ON THE DYNAMICS OF FEEDING OF YOUNG FISH FROM MOZHAYSK RESERVOIR IN VARIOUS YEARS,

Moscow State Univ. (USSR). Dept. of Ichthyology.
V. D. Spanovskaya, V. A. Grigorash, T. V. Lebedeva, and V. A. Rekubratskiy.
Journal of Ichthyology, Vol 20, No 1, p 74-83, January, 1980. 8 Tab, 15 Ref.

Descriptors: *Reservoirs, *Lakes, *Biomass, Fish, Fish populations, Feeding rates, *Mozhaysk Reservoir, *USSR, Limnology, Fish food.

Qualitative and quantitative changes in the feeding of young fish of the limnophilous association were studied in one of the sections of the Mozhaysk Reservoir in different years. The extent of the

effect of varying biomass in the food supply on the young was also assessed. The study was conducted in Khotilov inlet, which is a spawning ground for many species of fish and the foraging place of their young. It is felt that the behavior of the young of the roach, i.e., their distribution in the inlet at different times of the day, is closely connected with the nature of their feeding. In second-year roach and bream, feeding during the day and night occurs with varying intensity, as a rule decreases during the night. The daily consumption calculated for second-year roach from the Uchinskoye Reservoir in 1958 was 5% of body weight, which was close to that of the roach in the Mozhaysk Reservoir. The species and age composition, abundance and biomass of young fish in one of the inlets of the Mozhaysk Reservoir change in different years due to the appearance of strong year-classes and spawning times. The nature of the daily feeding rhythm, its stability and lability, depend on the amount of food, its accessibility and the ecology of the components constituting it. With the increase in the fish biomass in the inlet, food requirements increase, the influence of the fish on the food supply intensifies, and mechanisms ensuring its fuller use and at the same time reducing feeding competition between the various species are set in motion. LIMNOLOGICAL AND GEOCHEMICAL SURVEY OF WILLIAMS LAKE, HUBBARD COUNTY, MINNESOTA,

Geological Survey, Lakewood, CO. Water Resources Div.
J. W. LaBaugh, G. E. Groschen, and T. C. Winter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-123068, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 81-41, 1981. 38 p, 14 Fig, 8 Tab, 39 Ref.

Descriptors: *Lakes, *Limnology, *Geochemistry, *Mineralogy, Sediments, Groundwater, Nutrients, Phytoplankton, Zooplankton, Aquatic plants, *Minnesota, Hubbard County, *Williams Lake.

A limnological and geochemical survey of Williams Lake, Minn., was made in 1979 to provide an initial interpretative description of the lake and the contiguous ground-water system. This survey was made as part of a continuing research program related to the investigation of the interaction of lakes and their contiguous groundwater systems at Williams Lake, Minn., as well as other sites within the continental United States. During 1979, Williams Lake was dimictic, and the lake had high optical transparency; light penetrated to the lakebed throughout most of the lake. Aquatic macrophytes were present along the western shore and in the southern bay of the lake. Although the lake had clinograde-oxygen distributions during part of this survey, anaerobic conditions were not observed. The lake is moderately fertile with respect to its total phosphorus content. Nutrient data indicate phosphorus limits phytoplankton biomass levels in Williams Lake. Blue-green algae were the dominant group of the phytoplankton community and copepods were the dominant group of the zooplankton community when the lake was thermally stratified during the open-water season. Calcium and bicarbonate represent more than 90 percent of the dissolved constituents in Williams Lake and the contiguous ground-water system. Major mineralogical constituents of the lake sediments are quartz, dolomite, and calcite. Marl is present only in the littoral zone of the lake. Organic sediments in the lake consist of loose organic floc and gyttja. (USGS)

SUMMER REAERATION AND WINTER ICE REMOVAL FROM LAKES AND RESERVOIRS,

Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
J. E. Garton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157793, Price codes: A04 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University Technical Completion Report, November, 1981. 63 p, 28 Fig, 12 Tab, 12 Ref. OWRT-B-043-OKLA(7), 14-34-001-9091.

Descriptors: *Lakes, Destratification, *Ice removal, Garton pump, Water quality, Fish kills, *Reaeration, Aeration, *Phosphorus removal, *Lake Texoma, Texas, Oklahoma.

This report has three parts. Part one concerns an experiment conducted on Lake Texoma with an eight-foot propeller. Outflows ranged from 50 to 600 cubic feet per second. Maximum improvement for the various parameters occurred at different release rates. Maximum improvements observed were a 83-percent reduction in turbidity, a 68-percent reduction in sulfides, a 49-percent reduction in manganese, and a 53-percent reduction in phosphorus. Part two concerns experiments conducted at Pine Creek Reservoir near Valliant, Oklahoma. These experiments were with outflows ranging from 30 to 90. Experiments were conducted with various sizes of propellers pumping surface water dowward to the vicinity of the outlet. Reductions of the levels of iron and manganese in the outlet releases of 60 to 70 percent have been achieved with less than 2 horsepower input. Part three concerned winter ice removal on a 100-acre lake with a six-foot propeller pumping water upward. During a severe winter for Oklahoma when ice thickness was approximately nine inches, an open area of approximately one acre was maintained. This should be of benefit to waterfowl and should prevent winter fish kills under snow covered lakes.

NITROUS OXIDE CONCENTRATIONS IN LAKES: VARIATIONS WITH DEPTH AND TIME,

McGill Univ., Montreal (Quebec). Dept. of Microbiology.
R. Knowles, D. R. S. Lean, and Y. K. Chan.
Limnology and Oceanography, Vol 26, No 5, p 855-866, September, 1981. 8 Fig, 27 Ref.

Descriptors: *Nitrous oxide, *Lakes, *Sinks, Water depth, Air pollution, Denitrification, Nitrification, Trophic level, Path of pollutants.

Depth profiles of N20 were compared to other variables for several Ontario lakes which differ in size, depth, and trophic state. Water samples were collected, and the following were determined: chlorophyll alpha, dissolved total Kjeldahl nitrogen, NH4(+), NO2(-), NO3(-), and dissolved N20. Profiles of concentrations of 02 and nitrogen compounds in the different lakes indicated that the lakes can act as either net sources or sinks for atmospheric N20. High concentrations of N20 in Thompson Lake, a eutrophic lake, were found in the metalimnion during spring stratification when hypolimnetic 02 and NO3(-) were already being depleted. Up to 4 micrograms of N20 per liter were determined in oxygenated NO3(-)-containing bottom waters where both nitrification and denitrification were probably occurring. A third type of N20 distribution occurred in mesotrophic Lake St. George where an N20 maximum occurred in the metalimnion, with relatively low concentrations above and below this depth. (Small-FRC)

ON THE OCCURRENCE OF BIMODAL DIEL DISSOLVED OXYGEN CURVES IN AQUATIC SYSTEMS,

Amsterdam Univ. (Netherlands). Lab. of Aquatic Ecology.
R. Lingeman, and P. Ruardij.
Hydrobiologia, Vol 78, No 3, p 267-272, 1981. 2 Fig, 13 Ref.

Descriptors: *Dissolved oxygen, *Irradiation, *Water temperature, *Aquatic habitats, Ponds, Productivity, Primary productivity, Oxygen, Temperature.

A two-year study of bimodal diel dissolved oxygen curves in an artificial pond suggested that a persistent high irradiation level and/or a high rate of temperature increase and/or a simultaneous high rate of primary production may induce this phenomenon. About 28% of the diel oxygen curves were bimodal, usually with a first maximum in the afternoon and a second in the evening (separated by 1 to 4 hours). About 60% of the bimodal curves appeared in May and June, but never in October through March. Bimodal curves were observed at different levels of under- and super-saturation (between 65 and 150%). Both types of curves started and ended at the same level. The first maximum of the bimodal curve was the same height as the maximum of the unimodal one. There were no significant differences between unimodal and bimodal curves in the following: temperature at the moment of oxygen maximum, daily mean temperature, moment of minimum temperature and its value, moment of maximum temperature and its value, diurnal net production and respiration, daily range of concentration values, moment of the first oxygen minimum, and oxygen concentration at the minimum. MAJOR PHYSICAL FEATURES OF LONG POINT BAY AND ITS WATERSHED,

Ontario Ministry of the Environment, Toronto. Water Resources Branch.
I. W. Heathcote.
Journal of Great Lakes Research, Vol 7, No 2, p 89-95, 1981. 3 Fig, 13 Ref.

Descriptors: *Watersheds, *Physical properties, *Long Point Bay, Geologic history, Lakes, Lake Ontario, Sedimentation, Shores, Climates, Land use, Water resources development, *Ontario, *Lake morphology.

A summary of background information on the Long Point Bay area in Ontario, Canada is presented. The Bay itself is situated on a band of bedrock and surficial deposits which has similar characteristics from Buffalo to Port Stanley. The area is characterized by Devonian bedrock with overlying tilles, lacustrine sands or clays. There are some dynamic areas of soil erosion where the overburden is thick, with steep bluffs of 30 or more meters height dropping to lake level. Sediment transport is extensive here, with eastward accretion occurring at the top of Long Point. Several small streams drain the narrow Long Point Bay watershed. Most flow directly to the lake. Some of the smaller ones are periodically dry, thus posing problems for water supply and sewage effluent discharge throughout the area. Main lake currents influence the circulation in the bay as well as shoreline and bottom configuration. Extensive agricultural loadings do occur in the bay, but the water quality is the best in the nearshore Lake Erie area. Chemical parameters are fairly evenly dispersed over the bay area. Physical parameters such as turbidity do register local variations. The combination of relatively clean water, long sandy beaches, and extensive marshland makes the Long Point area attractive for recreational purposes also. These purposes serve to enhance the local economy. Long term environmental monitoring programs are underway, conducted by the local industries and the Ontario Ministries of the Environmental and Natural Resources. (Baker-FRC)

2I. Water In Plants

DIURNAL VARIATION IN WATER POTENTIAL COMPONENTS AND STOMATAL RESISTANCE OF IRRIGATED PEACH SEEDLINGS,

New Jersey Agricultural Experimental Station, New Brunswick.
E. Young, J. M. Hand, and S. C. Wiest.
Journal of the American Society for Horticultural Science, Vol 106, No 3, p 337-340, May, 1981. 4 Fig, 12 Ref.

Descriptors: *Diurnal distribution, *Water potentials, *Irrigation, Plant water potential, *Peach, Stomatal transpiration.

The objectives of this study were to explore the diurnal changes in total water potential and the osmotic and turgor potential components, and to determine the relationship of turgor potential with stomatal resistance in irrigated peach seedlings. Open-pollinated 'Halford' peach seeds were sown in a greenhouse bed in August, 1970, and allowed to grow for 3 months, until they were about 1 meter tall. A significant positive correlation was noted between turgor potential and total water potential, while osmotic potential remained fairly constant. There also appeared to be no rapid diurnal osmotic adjustment to maintain constant turgor, although there may have been some slight, long-term osmotic adjustment over the two week experimental period. When turgor approached zero, a depression of osmotic potential due to water loss through transpiration maintained turgor above zero. Stomatal resistance remained low throughout the day, even though total water potential dropped below -16 bars and turgor potential was below 2 bars. Stomatal resistance was negatively correlated with irradiance level but not with turgor potential. (Baker-FRC)

THE EVALUATION OF A LEAF-WATER POTENTIAL FUNCTION FOR CORN,

Kansas Agricultural Experiment Station, Colby.
F. R. Lamm, J. M. Gregory, and H. S. Cengiz.
Transactions of the ASAE, Vol 24, No 5, p 1172-1176, September-October, 1981. 3 Fig, 2 Tab, 40 Ref.

Descriptors: *Leaves, *Water potentials, Mathematical studies, Water availability, Irrigation, Soil water potential, Soil water, *Corn, Farming, Model studies.

An attempt was made to develop a simple model for leaf-water potential that could be used in scheduling irrigation. An equation relating leaf-water potential to vapor pressure deficit and soil water potential was developed for corn in Missouri. The soil water potential at the 30 cm depth was used to keep calculations relatively simple. The equation gave reasonable predictions over the range of observed data. The theoretical basis of the equation also satisfied many of the boundary conditions. The soil water potential at the 30 cm depth never fell below minus 5 bars in the two years of study on this northeast Missouri claypan soil. This limited range of soil moisture probably represented only a minor concern, as a soil water potential of minus 5 bars would probably not be permitted under irrigation. Many of the constants and functional relationships were evaluated by regression techniques. Some or all of the constants may be specific to one soil type and/or location. Although the constants may vary, the procedure used in the development should be applicable to other climates and soil types. (Baker-FRC)

WHEAT RESPONSE TO DROUGHT,

Science and Education Administration, Florence, SC.
R. E. Sojka, and L. H. Stolzy.
California Agriculture, Vol 35, No 9/10, p 14-15, September/October, 1981. 4 Fig.

Descriptors: *Wheat, *Drought, Moisture stress, Available water, Water stress, *Soil water, Plant water potentials, *Crop yield, Experimental farms, *Sonoran Desert, *Mexico.

Field experiments on wheat stress physiology and yield interrelationships were conducted for two years by scientists in Mexico, on the Sonoran Desert. Numerous soil and plant water status measurements were made to characterize the severity of the treatments imposed. Of special importance were measurements of xylem pressure potentials for plant water status, soil water content, and yield. Cultivars in any given stress treatment did not differ markedly in water use, but well-irrigated controls required about 3.5 times as much water as did plants in any of the stressed treatments. Soil water regimes were nearly identical for all the cultivars in any given stress treatment. The daily stress patterns could be expressed statistically as three linear phases of the xylem pressure potential response. In the morning this response began to drop until about 10 AM. After 11 AM the response ceased to drop, stabilizing until about 4 PM, after which stress relief was evident and the resonse began to rise. As the season progressed, the daily responses during the stable midday periods resulted in several relationships. Daily responses reflected the increased severity of stress in the nonirrigated treatments. Eventually a point was reached when the xylem pressure potential did not return to near zero values before dawn. Instead, plants were forced to enter succeeding daily cycles without full recovery. When presunrise recovery values fell to minus 7 bars, the yield loss was about 80% compared to controls. Plant water status measurements have a genuinely important role in evaluating wheat cultivars for response to drought. (Baker-FRC)

EFFECT OF CORN AND SOYBEAN ROW SPACING ON PLANT CANOPY, EROSION, AND RUNOFF,

Science and Education Administration, Ames, IA.
T. S. Colvin, and J. M. Laflen.
Transactions of the ASAE, Vol 24, No 5, p 1227-1229, September/October, 1981. 2 Fig, 3 Tab, 13 Ref.

Descriptors: *Agricultural engineering, *Runoff, Erosion, Plant growth, Corn, Soybeans, *Erosion control.

The effects of row spacing on the development of plant canopy cover were determined, and the effects of row spacing on erosion hazard were considered. Two Iowa experimental sites of nearly uniform slope, previously in row crops, were chosen to contrast soils and slopes. A randomized complete-block design with two replications was used at each location. There were six treatments: fallow; soybean row widths of 250, 510, and 760 mm; and corn row widths of 510 and 760 mm. The corn row widths showed less effect on canopy development than the row width of soybeans. The 510 and 760 mm wide corn rows did not show much difference in canopy development at either location up to 50% cover, but the 510 mm wide corn rows reached 75% cover about 10 days earlier than the 760 mm wide corn rows at Castana. Row width had no significant effect on runoff volume. As the season progressed, runoff volumes from the fallow plots were significantly greater than those from the cropped areas at Castana. There was little if any observable effect of kind of crop or row width on soil erosion at any crop stage. This was apparently caused by two factors. First, very little difference was expected between the treatments, based on soil loss predictions using the Universal Soil Loss Equation, and second, the precision in this study and likely in most studies dealing with soil, plants, and topography was not sufficient to detect the small difference expected. Narrow row cropping should have only a minor effect on field soil losses, if surface conditions are no different for narrow row crops than for wide row crops. The effect of the narrower rows, if observable, should be to reduce field soil losses. (Baker-FRC)

ESTIMATING CONTRIBUTION OF OVERSTORY VEGETATION TO STREAM SURFACE SHADE,

Pacific Northwest Forest and Range Experiment Station, La Grand, OR.
T. M. Quigley.
Wildlife Society Bulletin, Vol 9, No 1, p 22-27, 1981. 1 Fig, 4 Tab, 11 Ref.

Descriptors: *Vegetation effects, *Natural streams, *Solar radiation, Water quality, Temperature effects, Environmental effects, Shaded streams.

A method was developed for estimating the contribution of forest overstory to stream surface shade to aid in the prediction of solar heating of streams. Average stream width, average vegetation to stream distance, and stream orientation are inputs. Vegetation contributes to stream shade through overstory height, vegetation density, and crown size. The information needed to calculate stream shade can be gathered when stream inventory data are collected. The method was illustrated using an example. The method can aid managers in estimating stream surface shade and thus help in managing stream water quality, particularly water temperature. (Small-FRC)
W82-02301

SEASONAL PATTERNS OF PLANT AND SOIL WATER POTENTIAL ON AN IRREGULARLY-FLOODED TIDAL MARSH,

Smithsonian Institution, Rockville, MD. Radiation Biology Lab.
T. M. De Jong, and B. G. Drake.
Aquatic Botany, Vol 11, No 1, p 1-9, July, 1981. 2 Fig, 1 Tab, 17 Ref.

Descriptors: *Water potentials, *Aquatic plants, *Tidal marshes, Soil-water-plant relationships, Soil water potential, Plant water potential, Species composition, Salinity, Rhode River, *Chesapeake Bay, Marshes.

Plant water potential and soil water potential were measured in four salt marsh plant communities to determine whether there were correlations between the water potentials of the species and the soils in which they grew. Measurements were taken before dawn once a week throughout the 1978 growing season in a tidal marsh near Rhode River, Chesapeake Bay. Two species, Scirpus olneyi Gray and Scirpus robustus Pursh, had water potentials > or = -5 bar throughout the season and showed no seasonal trends. Mean seasonal dawn water potentials were -3.3 and -2.6 bar, respectively. Three species, Iva frutescens L., Spartina cynosuroides L. Roth, and Panicum virgatum L., had water potentials that ranged between nearly zero to -16 bar, with values generally decreasing as the season progressed. Mean seasonal dawn water potential values were -5.3, -6.0, and -7.5 bar, respectively. Soil water potentials at 50 cm depth did not vary more than 3 bar for any given community. Mixed communities always had the most negative mean soil water potential; creek bank communities, intermediate; and forest margin, the least negative. Measurements at 10 cm, the root zone, became more negative as the season progressed and reversed slightly at the very end of the sampling period. Contrary to expectations, plant species with the lowest dawn plant water potentials occurred in communities having the highest soil water potentials and vice versa. Therefore, no clear correlation between plant and soil water potentials could be made. Salinity and root systems are possible factors in plant species distribution. (Caesar-FRC)

LEAF PHOTOSYNTHESIS, LEAF PERMEABILITY, CROP GROWTH, AND YIELD OF

Group 2I—Water in Plants

SHORT SPRING WHEAT GENOTYPES UNDER IRRIGATION,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
R. A. Fischer, F. Bidinger, J. R. Syme, and P. C. Wall.
Crop Science, Vol 21, No 3, p 367-373, May/June, 1981. 2 Fig, 5 Tab, 23 Ref.

Descriptors: *Irrigation, *Wheat, *Crop yield, Photosynthesis.

Forty-eight genotypes of spring wheat were flood irrigated at seeding and 6 times during the growing season to determine the relationships of leaf photosynthesis to crop growth rate and yield. Wheats investigated were 3 tall and 33 short (Norin 10-derived) bread wheats (Triticum aestivum L.), 8 short durum wheats (T. Turgidum L.) and 4 triticales (X Triticosecale Wittmack). Species effects were not significant. However, genotypic effects on photosynthetic activity ranged from 14.7 to 20.4 mg CO2 per sq dm per hr and leaf permeability to viscous airflow, from 5.6 to 11.1 permeability units. In the short bread wheat group photosynthesis was not related to specific leaf weight or to leaf permeability. AT 4 weeks before anthesis, photosynthesis and preanthesis crop growth rate were weakly correlated, and both these traits were positively correlated with mature plant height. Photosynthesis was also positively correlated with crop growth rate during grain filling and with yield. Yield was positively correlated with leaf permeability. Effects of dwarfing genes on these relationships are discussed. Highest crop yields (767 g per sq meter) were in a Rht 2 gene group, genotypes Cajeme 71, Ferc 4A, Ferc 3, Yaqui 50E, Vicam 71, Kal-Bp, 8948-A1. (Cassar-FRC)

IRRIGATION REQUIREMENTS OF FIELD-PEA FOR GRAIN,
Indian Council of Agricultural Research, New Delhi.
S. B. Hukkeri, and A. K. Sharma.
Indian Journal of Agricultural Sciences, Vol 50, No 2, p 157-160, February, 1980. 1 Tab, 4 Ref.

Descriptors: *Moisture availability, *Crop yield, Drought, Water stress, Frost, Farming, Frost protection, Soil moisture, Water table, *Irrigation requirements, Loam, *Soil-water-plant relationships, Field pea.

The distribution of rainfall and the availability of soil water before irrigations were evaluated. Field experiments were conducted in the winter of 1972-73 and 1973-74 on a sandy-loam soil of medium fertility. The field was high-lying, with the water table located more than 3 to 4 meters below the surface. The available water content in 0-60 cm depths of soil layer was 106 mm. In 1972-73 a total of 114 mm rainfall was received in three periods. In 1973-74 rainfall was negligible, only 6.3 mm of rain being received. Irrigation treatments varied according to the physiological stages of the crop. In 1972-73 the crop did not respond to the differential irrigation treatments due to the fact that rainfall was received three times during the growth period. The rains coincided with the initiation of flowering and pod formation, thus fulfilling the water needs of the crop. In 1973-74 the crop responded to differential irrigations. One irrigation given either at the vegetative stage or at the initiation of the flowering stage produced significantly higher yield as compared with the treatment with no irrigation after sowing. Two irrigations applied at the initiation of flowering and the pod development stages or at the initiation of flowering and pod formation further increased the yield. Irrigation at the vegetative stage caused the crop to yellow and reduced yields. This low yield may be due to an impeded oxygen supply to the crop due to the sealing effect or surface irrigation. The maintenance of high available moisture in the active root zone during flower initiation to early podding also helped plants tolerate frost. (Baker-FRC)

SOIL MOISTURE USE BY MIXED CONIFER FOREST IN A SUMMER-DRY CLIMATE,
California Univ., Berkeley. Dept. of Plant and Soil Biology.
R. J. Arkley.
Soil Science Society of America Journal, Vol 45, No 2, p 423-427, March/April, 1981. 4 Fig, 7 Tab, 5 Ref.

Descriptors: *Forest soils, *Moisture availability, California, Water use, Soil water, Streamflow, Hydrologic budget, Trees, Forests, Pine trees, Seasonal variations, *Soil-water-plant relationships, *San Bernardino Mountains.

Soil moisture regimes were studied at 16 sites in the San Bernardino Mountains, an east-west ranged dominated by granitic rock types. All sites were within a mixed conifer forest dominated by ponderosa pine with associated sugar pine, incense-cedar, and California black oak and by Jeffrey pine with white fir. Soil moisture depletion occurred to depths of 274 cm from coarse loamy and sandy-skeletal soils and underlying decomposed granite. Available soil moisture storage ranged from 129 mm, where hard rock was encountered at 121 cm, to as high as 496 mm, where the underlying material was grus. Water use during the growing season appeared equal to available moisture storage during long dry summers, but was considerably increased in years with summer precipitation. Water use by the trees extends to depths considerably deeper than the 274 cm sampled. Productivity, and in fact survival, of the forest trees in this summer-dry climate appear to depend on moisture stored at considerable depth in fractured or decomposed rock. Tree use of such deep moisture may explain the relatively small runoff measured in southern California streams compared with that estimated by the water balance method. (Baker-FRC)
W82-02558

NUTRIENT CONTENTS OF PRECIPITATION AND CANOPY THROUGHFALL UNDER CORN, SOYBEANS, AND OATS,
South Dakota State Univ., Brookings. Dept. of Plant Science.
E. M. White.
Water Resources Bulletin, Vol 17, No 4, p 708-712, August, 1981. 4 Tab, 17 Ref.

Descriptors: *Nutrients, *Rainfall, *Soil-water-plant relationships, Crops, Ammonia, Nitrogen, Phosphorus, Nitrates, Runoff, Storm events, Soil water, Rainfall-runoff relationships, Corn, Soybeans, Oats, Throughfall, Canopy, Cycling nutrients, Water pollution sources.

Nutrients in meteoric precipitation (MP) and throughfall precipitation (TFP) were studied to determine their potential effects on runoff quality. Corn, soybean, and oat canopy TFP and MP were collected, respectively, at 10 cm and 1.5 meters above ground level. MP, TFP, and runoff samples were collected as soon as possible after an event, usually within 18 hrs. Differences in the bulk ammonia-nitrogen concentration in MP and TFP were slight for corn and oats, but soybean canopies enriched the MP with ammonia-nitrogen. Canopies of the three crops enriched MP with nitrate-nitrogen, particularly near the row for corn. Plant canopies increased the soluble and total phosphate-phosphorus concentrations, particularly near the corn rows. Soybeans had a similar effect on soluble phosphate-phosphorus but not on total phosphate-phosphorus. When the concentrations of nutrients found in MP, TFP, and in runoff from soil were calculated, the average ammonia-nitrogen concentrations decreased from MP to TFP to runoff. It was concluded that PM falling on soybeans loses ammonia-nitrogen and soluble phosphate-phosphorus to the vegetation, but gains nitrate-nitrogen, total phosphate-phosphorus and soluble potassium. With corn, ammonia-nitrogen is lost if the MP content is high otherwise MP gains ammonia-nitrogen, nitrate-nitrogen, soluble phosphate-phosphorus, total phosphate-phosphorus and soluble potassium from the canopy. Oat canopies enrich MP with the five ions. TFP concentrations were not large enough to determine the nutrient content of soil runoff water. (Baker-FRC)

ATCHAFALAYA DELTA: SUBAERIAL DEVELOPMENT; ENVIRONMENTAL IMPLICATIONS AND RESOURCE POTENTIAL,
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
R. Cunningham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, Oct. 1981. p 349-364, 11 Fig, 1 Tab, 11 Ref.

Descriptors: *Estuaries, *Deltas, *Wetlands, *Floods, Sediment transport, Hydrodynamics, Marshes, Mudflats, Habitats, Mississippi delta, Louisiana.

A major geologic event in the history of the Mississippi delta system is now in progress along the central Louisiana coast. Because of a distinct gradient advantage, the main distributary of the Mississippi River, the Atchafalaya River, is rapidly developing a subaerial delta in Atchafalaya Bay, 130 miles (200 km.) west of the modern bird-foot delta. The subaerial growth of the new delta is being monitored with remote sensing techniques, land and hydrographic surveys and a sediment sampling program. Initial formation of new land in the Atchafalaya Delta has been found to occur sporadically with accretional periods coinciding with flood pulses of the river. Approximately 12.39 sq mi (32 sq km) of new land had been formed by 1976 with additional accumulations following the 1979 flood. A prototype data collection program is currently underway to provide data for a study of estuarine hydrodynamics and sediment transport in the bays and near offshore areas of the Atchafalaya-Vermillion estuarine complex. Accretional impact lines include subaerial deltaic sedimentation, subaqueous bay fill and mudflat-marsh building in a region formerly characterized by shoreline retreat. These impacts are presently producing negative effects on open water habitats, but the potential for improved marsh and aquatic nursery ground environments and expansion of human habitats in the vicinity of Morgan City far outweighs loss of open bay habitats. The Corps of Engineers is considering several project alternatives for mitigation of present impacts and management of future delta growth. (Author's abstract)

SEDIMENT TRANSPORT DURING A CONTROLLED RESERVOIR RELEASE,

Oregon State Univ., Corvallis. School of Forestry.
R. L. Beschta, W. L. Jackson, and K. D. Knoop.
Water Resources Bulletin, Vol 17, No 4, p 635-641, August, 1981. 6 Fig, 2 Tab, 13 Ref.

Descriptors: *Sediment transport, *Reservoir releases, Tractive forces, Sediment distribution, Utah, Flow control, Reservoir fisheries, Streams.

A controlled release of water from Electric Lake Reservoir, in central Utah, was undertaken for the purpose of improving the downstream fisheries habitat by removing fine sediments from the Huntington Creek stream channel. The Electric Lake Dam was constructed from 172 to 174. During this same time period State Highway 31 was upgraded. Both activities increased sediment delivery along much of Huntington Creek. The controlled release was planned for early August 1979, with a peak discharge of 5.7 cubic meters/second or more. The release was to last for 75 hr, beginning with a series of incremental increases over a six-hour period, culminating in a peak discharge to be held for 18 hr, but then rapidly dropped and finally returned to a flow slightly less than the original peak for the remainder of the release. In practice, however, the peak flow was 4.9 cubic meters/second. No changes in the armour layer occurred, and thus no changes in cross sectional profiles at the riffles were noted and no differences were found in the frozen streambed cores obtained before and after the release. A considerable amount of sediment was apparently available from other in channel locations, including fine sediments scoured from pools and along channel banks as well as deposits on stable riffles and from beaver ponds. It is not known as yet whether this flushing of fine sediments from channels and riffles actually improved the aquatic habitat for the fish. (Baker-FRC)

FORMATION OF A BOTTOM FLOW IN A NATURAL WATER BODY WITH VARIOUS TYPES OF DENSITY STRATIFICATION,

Moscow State Univ. (USSR).
Yu. G. Pyrkin, B. I. Samolubov, and E. I. Debol'skaya.
Water Resources (English Translation), Vol 7, No 4, p 365-374, July-August, 1980. 6 Fig, 1 Tab, 14 Ref. Translated from Vodnye Resursy, No 4, p 144-155, July-August, 1980.

Descriptors: *Bottom currents, *Density currents, *Stratification, Flow characteristics, Suspended sediments, Sediments, *Sediment transport.

Knowledge of density current structures and formation is needed to improve methods of predicting siltation of water bodies, controlling alluviation, and discharging high-density wastewaters. Density currents were investigated in a canyon-like water body about 50 km long, up to 5 km wide, and up to 300 meters deep. It receives a powerful river sediment load composed of very fine (less than 50 micrometers) suspended particles. Average sediment concentration is 4 kg per cu meter; river water temperature is 1-6 C less than in the basin; and a plume up to 30 km forms. The following were recorded: the vertical distribution of the concentration of the suspended material, water temperature, current velocity on sections along the axis of the flow, and the temporal variation of these flow parameters at the initial points on the longitudinal-axial sections of the current. A decrease in the velocity of the streamflow upon increase of the cross-sectional area at the river mouth led to deposition of the suspended particles and formation of a high-density bottom fluid layer with a well-defined upper boundary. Separation of the bottom stratified flow into two vertical zones with a maximum density gradient and minimum flow velocity in the region of their boundary occurs. This process is accompanied by decreases in the concentration of suspended material in the flow and in its thickness. Thus, separation of suspended particles by size occurs during formation of the stratified bottom flow. the two-layer structure is a metastable, transient state of the density current during its formation; nevertheless, the stability of the upper boundary of the forming stratified flow is no less than in the case of a turbidity (mechanically stratified) current. DERIVING SEDIMENT YIELD PROBABILITIES FOR EVALUATING CONSERVATION PRACTICES,

Science and Education Administration, Tifton, GA. Southeast Watershed Research Center.
W. C. Mills.
Transactions of the ASAE, Vol 24, No 5, p 1199-1203, 1210,. September-October, 1981. 2 Fig, 28 Ref.

Descriptors: *Agricultural engineering, *Soil management, *Soil erosion, Erosion, Sedimentation, Farming, Soil engineering, Soil conservation, Conservation, Model studies, Mathematical models, Rainfall, runoff, *Sediment yield, Sediment distribution, *Probability distribution.

Probability distributions of annual sediment yield are derived for both conventional and minimum tillage of watershed cropland. These sediment yield distributions are needed to adequately evaluate future effects of alternative conservation practices. They can be derived by coupling stochastic models of rainfall and watershed state to a deterministic model of the sediment yield process. Such coupling transforms rainfall and state probabilities to sediment yield probability distributions. Several deterministic event based models that predict watershed sediment output for given rainfall event characteristics and watershed state have been proposed and are briefly noted. One of these, which is readily available, was used to demonstrate sediment yield probability computations. A bivariate rainfall model, consisting of a Weibull distribution for rainfall event duration and a log-normal distribution for event depth with given duration, was demonstrated. A watershed state model giving probabilities for three classes of antecedent moisture conditions was used. A coupling technique derived from probability generating function was used to provide accurate transformation of rainfall and state probabilities. Probability distribution of annual sediment yield from Ahoskie Creek watershed near Ahoskie, North Carolina were computed for conventional and minimum tillage. The sediment yield probability distribution computed for conventional tillage was checked by comparing computed values with the average and range of reservoir sediment measurements. (Baker-FRC)

VERIFICATION OF THE SLOPE FACTOR IN THE UNIVERSAL SOIL LOSS EQUATION FOR LOW SLOPES,

Science and Education Administration, Oxford, MS. Sedimentation Lab.
C. E. Murphree, and C. K. Mutchler.
Journal of Soil and Water Conservation, Vol 36, No 5, p 300-302, September-October, 1981. 1 Fig, 2 Tab, 5 Ref.

Descriptors: *Erosion, *Slopes, Slope stability, Farming, Erosion rates, Erosion control, Simulation, Model studies, Rainfall, *Soil erosion, Mississippi Delta.

A site in the Mississippi Delta near Jonestown, Mississippi, was selected for a study of soil loss under rainfall conditions. On the chosen plots the soil was deep enough so that cutting and filling could be done to establish the desired slopes on adjacent rainulator plots. Six plots were duplicated, with slopes of 0.1, 0.2, 0.5, 1, 2, and 3%. Soil samples were taken before each run to determine the antecedent soil water content. Sediment samples were taken during the runs at 3 minute intervals. Continuous records of runoff were computed. The slope-factor equation of the universal soil loss equation (USLE) was based primarily on data from slopes greater than 3%. Thus it is reasonable to suspect some discrepancy in soil loss estimates for flatter slopes. Soil losses from 75 foot plots were less than half that predicted by the USLE for slopes less than 0.2%. This discrepancy approached zero for slopes of about 3%. It is also noted that the greater surface water depths found on flat lands under high rainfall intensities reflected in the R-factor would reasonably be expected to reduce erosion more extensively on flatlands than on steeper land. This expectation was supported by the data of this study. However, the irregularity of farm-field surfaces exposed only a portion of the surfaces to raindrop impact. This portion was estimated to be about one-half. It was recommended that the use of the present slope factor equation used in the USLE be continued, but the soil loss estimates for flatlands be reduced by an R-factor coefficient. (Baker-FRC)

ESTIMATING SEDIMENT TRANSPORT CAPACITY IN WATERSHED MODELING,

Science and Education Administration, Oxford, MS. Sedimentation Lab.
C. V. Alonso, W. H. Neibling, and G. R. Foster.
Transactions of the ASAE, Vol 24, No 5, p 1211-1220, 1226, September/October, 1981. 1 Fig, 4 Tab, 33 Ref.

Descriptors: *Sediment transport, *Model studies, Tractive forces, Mathematical studies, Watersheds, *Sediment-carrying capacity, Estimating.

Attempts were made to evaluate, using available data, a number of the sediment transport formulas suitable for watershed modeling. The first part of the paper describes the criteria followed in selecting the formulas. The second part lists the characteristics of these data, which included 739 tests from natural streams, laboratory flumes, and erosion plots. The third part examines how well each formula fits the data when it is used directly, without modification or readjustment of its coefficients. Recommendations are made regarding the applicability of the formulas within different ranges of the data. Of the nine sediment transport formulas compared with flume field data, the Yang formula best estimated streamflow carrying capacity in the range of fine to coarse sands. The Laursen formula reasonably predicted small streamflows carrying very fine sands and silts. However, it should be used with some reservations for computing transport of lighter materials. The Yalin formula can be used to compute sediment transport capacities for overland flows. It gave satisfactory results for the range of sizes and densities characteristic of field situations, and can also be used with confidence to predict transport rates of light materials in streamflows. The other formulas considered included: Ackers-White, EM-1, EM-2, Engelund-Hansen, Laursen, Bagnold, and Meyer-Peter Muller. (Baker-FRC)

SEDIMENT YIELD FROM A MISSISSIPPI DELTA COTTON FIELD,

Science and Education Administration, Oxford, MS. Sedimentation Lab.
F. E. Dendy.
Journal of Environmental Quality, Vol 10, No 4, p 482-486, October/December, 1981. 5 Fig, 1 Tab, 12 Ref.

Descriptors: *Sediment yield, *Erosion rates, *Soil erosion, Cotton, Mississippi, Sediment distribution, Sediment sorting, Particle size, Sediment concentration, *Agricultural runoff, Runoff, Vegetation effects.

Sediment yields from flat (0.2%) delta fields in Mississippi were higher than expected, from a low of 5.1 metric tons per ha per year in 1978, a year of below normal rainfall, to 12.0 metric tons per ha per year in 1979, a year of above-normal rainfall. Mean monthly concentrations of sediment in runoff varied from 164 ppm in October to 2750 ppm in April. This shows the effects of the vegetation-bare fields during seedbed preparation in April-May and after harvest and fall plowing in November. Using these cultural practices, fields are highly susceptible to erosion in January, April, May, and November. During August-October vegetation protects the soil from severe erosion. Particle size distributions of sediments washed from the fields were > 62 microns, (sand) none; and < 2 microns (clay), 83%. 98% of the material was < 16 microns in diameter. The proportion of fine material (clay) was the same for large and small storms (0.5-3.6 cm per hour). Field soils were composed of 24% particles < 2 microns, 47% < 53 microns, and 53% > 53 microns. The particles removed by erosion were largely finer materials, producing a gradual enrichment of coarse particles in the soil over long periods of time. (Cassar-FRC)

BANK FAILURE AND EROSION ON THE OHIO RIVER,

Louisville Univ., Kentucky. Dept. of Civil Engineering.
D. J. Hagerty, M. F. Spoor, and C. R. Ullrich.
Engineering Geology, Vol 17, No 3, p 141-158, 1981. 9 Fig, 3 Tab, 6 Ref.

Descriptors: *Bank erosion, *Rivers, *Flood damage, Erosion, *Ohio River, Currents, Navigation, Wave action, Internal water, Alluvial soils.

The construction and operation of navigation dams and towboat traffic on the Ohio River have been blamed for bank erosion and failures. However, examination of historical information and monitoring and mapping investigations have shown that bank failure is not caused by these processes but is a function of bank materials, topography, land use, river morphology, and weather cycles. Review of historical illustrations, photographs, and literature dating back to 1770 reveals that severe bank erosion has been common during this entire period. Although bank failure and erosion are episodic and complex, the most important mechanism appears to be removal of bank material by current forces during floods and internal erosion of bank materials by bank discharge after floods. Age of navigation pools, water level fluctuations within a pool, waves generated by vessels, and boat traffic volume showed no correlation with bank failure. The coarse alluvial soils, common along the Ohio, are especially subject to erosion. (Cassar-FRC)

TWO BED-LOAD FORMULAS: AN EVALUATION,

Ain Shams Univ., Cairo (Egypt).
M. I. Amin, and P. J. Murphy.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY8, p 961-972, August, 1981. 5 Fig, 1 Tab, 9 Ref.

Descriptors: *Sediment transport, *Bed load, *Sand, Channel scour, Bed load discharge, Suspended sediments, *Fish Creek, *New York, Shear stress, Flow velocity, Meyer-Peter-Muller equation, Toffaleti equation, Mathematical equations.

Two bed load equations were evaluated in sand-bottomed channels by measuring the hydraulic data required for the formulas and the actual sediment transport rate and comparing the calculated values with values observed in the Fish Creek, Rome, New York. Over a two year period 81 samples were collected. Data was smoothed by placing the samples in order of their sediment transport rates and averaging each set of five neighboring values. The Toffaleti (1969) equation produced the better agreement between predicted and measured bed loads. The data showed a scatter of a factor of 2.5, probably a result of the effects of grain size, water depth, and temperature on the shape of the local energy grade line used in the procedure or the randomness of the bed load. The Meyer-Peter and Muller (1948) equation, a threshold type, was not suitable for sand-bed channels. Predictions were significantly higher than measured sediment transport rates. In some cases movement was observed where zero movement was predicted. (Cassar-FRC)

SEDIMENT TRANSPORT IN THE TANANA RIVER NEAR FAIRBANKS, ALASKA, 1977-79,

Geological Survey, Anchorage, AK. Water Resources Div.
R. L. Burrows, W. W. Emmett, and B. Parks.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A105363, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 81-20, 1981. 56 p, 20 Fig, 29 Tab, 9 Ref.

Descriptors: *Sediment transport, *Bed load, *Particle size, Streamflow, Suspended sediments, Sediment discharge, Flow rates, Hydrologic data, *Alaska, Fairbanks, *Tanana River.

Suspended sediment and bedload transport rates for the Tanana River near Fairbanks, Alaska, can be related to water discharge, and annual sediment loads can be computed using these relations. For a site near Fairbanks, the average annual (1974-79) load is 24 million metric tons of suspended sediment and 321,000 metric tons of bedload. Upstream, near North Pole, the average annual load is 20.7 million metric tons of suspended sediment and 298,000 metric tons of bedload. For both sites bedload is usually 1 to 1.5 percent of suspended sediment load. Particle size distribution of suspended sediment is similar at Fairbanks and North Pole. Median particle size is generally in the silt range, but at some low-water discharges, it is in the very fine sand range. Median particle size of bedload near North Pole is generally in the gravel range, but at some low transport rates, it is in the medium sand range. In 1977 median bedload particle size was comparable at the two sites, but in 1978 the median size was markedly smaller at Fairbanks. In 1979, generally coarser material was transported at both sites, but the decrease in bedload particle size was even greater between the sites. At both sites and at all water discharge and sediment transport rates, suspended load particles are significantly smaller than bedload particles. At North Pole in 1979, median bed material particle size was in the course gravel range; at Fairbanks it was in the medium gravel range in the main channel but in the fine sand range in the overflow part of the channel. CUMULATIVE EFFECTS OF LOGGING ROAD SEDIMENT ON SALMONID POPULATIONS IN THE CLEARWATER RIVER, JEFFERSON COUNTY, WASHINGTON,

Washington Univ., Seattle. Fisheries Research Inst.
C. J. Cederholm, L. M. Reid, and E. O. Salo.
In: Proceedings from the Conference, Salmon Spawning Gravel: A Renewable Resource in the Pacific Northwest, October 6-7, 1980, Seattle, State of Washington Water Research Center, Washington State Univ., Pullman, Rept No 39, March, 1981. p 38-74, 10 Fig, 7 Tab, 44 Ref.

Descriptors: *Sediment control, *Rivers, *Spawning, *Salmon, *Gravel, Fish management, Logging, Detritus, Catchment areas, Ecological effects, Landslides, Forestry, Road construction, Access routes.

In 1971 a series of massive landslides on the west coast of the Olympic Peninsula, which included both logging and road sidecast failures, prompted research on the sedimentation of salmonid spawning habitats. The sedimentation from logging road activities has caused long-term concern for fisheries resources of the Clearwater River. This study included analyses of field situations supplemented by controlled experiments. Significant amounts (15-25 percent) of fine sediments (less than 0.85 mm diameter material) are accumulating in spawning gravels of some heavily roaded tributary basins. This accumulation is highest where the road area exceeds 2.5 percent of the basin area. Tributaries of relatively steep gradient are less likely to accumulate high levels of fines. The survival of salmonid eggs to emergence is inversely correlated with percent fines when the percentage of fines exceeds the natural level of 10 percent. The presence of 2.5 km/km-squared of gravel-surfaced roads undergoing an average distribution of road uses is found to be responsible for producing sediment at 2.6 to 4.3 times the natural rate in a drainage basin. Sixty percent of the road-related sediment production is caused by landslides, while 18-26 percent is caused by erosion on road surfaces. However, if fine sediment alone is considered, the production from road surfaces and landslides is nearly equal. (Garrison-Omniplan)

MT. ST. HELENS AND THE FISH,

Washington State Dept. of Fisheries, Olympia.
W. Rees.
In: Proceedings from the Conference, Salmon Spawning Gravel: A Renewable Resource in the Pacific Northwest. Oct 6-7, 1980, Seattle. State of Washington Water Research Center, Washington State Univ., Pullman. Rept. No 39, March, 1981. p 168-175. 1 Fig, 1 Tab.

Descriptors: *Volcanoes, *Fishkill, *Salmon, *Stream fisheries, *Sediment concentration, Economic aspects, Landslides, Gills, Fish hatcheries, Mudflows, Turbidity, Sediment control.

The Mt. St. Helens eruption in May 1980, signalled by an earthquake of magnitude 5, was a direct lateral explosion—the worst of all types of volcanic eruptions. The blast was followed by pyroclastic flows that in turn touched off mudslides affecting rivers up to twenty miles away. Observations in the Cowlitz River indicated that the new sediment deposit was 12 to 15 feet deep throughout the Cowlitz channel and had reduced the channel's capacity by about 85 percent. Significant quantities of sediment were also carried out into the Columbia River, destroying the navigational channel in some locations. All fish were killed in the mainstem Toutle River and its North and South Forks, as well as in the lower 20 miles of the Cowlitz River. In addition, the Toutle Hatchery was inundated and suffered a loss of juvenile salmon. This loss of salmon represents a direct economic loss of over $7.5 million to fisheries. Seven major hatcheries in the area have been affected by the eruption. Mortalities to juvenile salmon held in live boxes since the eruption have ranged from 100 percent mortality in less than six hours to 100 percent survival in some areas during a low flow period. Mortality to juveniles and adults is due to gill abrasion, and increases with higher turbidity. Temporary rehabilitation efforts are underway, but long-term effects cannot be quantified at this time. (Garrison-Omniplan)

CHARACTERIZATION OF SPAWNING GRAVEL AND STREAM SYSTEM EVALUATION,

Corvallis Environmental Research Lab., OR.
M. A. Shirazi, W. K. Seim, and D. H. Lewis.
In: Proceedings from the Conference Salmon Spawning Gravel: A Renewable Resource in the Pacific Northwest. Oct 6-7, 1980, Seattle. State of Washington Water Research Center, Washington State Univ., Pullman. Rept No 39, March 1981. p 227-278. 5 Fig, 8 tab, 18 Ref, Append.

Descriptors: *Sediment control, *Stream fisheries, *Salmon, *Spawning, *Gravel, Stream erosion, Particle size, Landslides, On-site data collections, Forestry, Logging, Detritus, Ecological effects, Streams, *Pacific Northwest.

As a result of silviculture activities in the Pacific Northwest, various levels of sediments and debris enter the streams, degrading spawning substrate of salmonid fishes. To provide a unifying methodology for monitoring and assessing stream gravel composition, an experiment was conducted in the summer of 1978 that addressed gravel composition differences at a variety of spawning substrates, using sites from ten to several hundred square meters in size. Included in the study were streams in the Siuslaw National Forest in Oregon, a segment of the Rogue River in Oregon, and a small salmon stream in southeast Alaska. It was found that the mean geometric particle diameter provides a convenient and theoretically sound parameter that expresses the entire range of the particle distribution and effectively relates particle size to salmonid embryo survival. Thus, the mean geometric particle diameter is preferable to percent fines. Either manual core or freezecore samplers are adequate when properly used. Sample depth should be 25 cm; single freezecores or manual cores less than 15 cm in diameter may give inadequate sample size in coarse substrates. Sieve series should follow the series in millimeters from 64 to .063. Also recommended is a combination of visual estimation and actual sampling. Comparison between existing and expected normal background sediment characteristics will provide the basis of assessing spawning habitats. (Garrison-Omniplan)

HYDRAULICS OF FLOW AND SEDIMENT TRANSPORT IN THE KANKAKEE RIVER IN ILLINOIS,

Illinois State Water Survey, Champaign.
N. G. Bhowmik, A. P. Binini, W. C. Bogner, and R. P. Byrne.
Illinois Institute of Natural Resources Report of Investigation 98, 1980. 132 p, 80 Fig, 14 Tab, 92 Ref, 17 Append.

Descriptors: *Sediment transport, *River basins, *Flow measurement, *Flow rates, Deposition, Rivers, Gaging stations, Low flow, Scour, Sedimentation, Flood peak, Sandbars, Channeling, Streamflow, Flood flow, *Kakakee River, Illinois.

Detailed hydraulic and geometric data were collected from various locations along the Kankakee River to study the mechanics of flow and the sediment transport capability of the river. An historical review of the river basin over the last few hundred years showed the progression of the river channelization in Indiana about 65 years ago, as well as the behavior of the river in the straigtened portion in Indiana and the nonstraigtened portion in Illinois. An analysis of the historical data related to peak flows, average flows, and low flows for six gaging stations showed a trend of increasing peak flows at Shelby and Momence, with a similar trend of increasing average flows at Momence and Wilmington. Deposition and scour occurred at various places in the main stem of the river in Illinois between 1968-1978. An analysis of more than 300 bed material samples indicated that the median diameters of the bed materials of the river range in size from 0.2 to 0.4 mm. During flood season, for a period of about 60 to 80 days, the river carries 70 to 80 percent of the yearly sediment load at all the gaging stations. The Iroquois River watershed contributed more suspended sediment load per square mile of drainage area than the main stem of the Kankakee River. A number of active sand bars were surveyed, and one near the state line appears to be forming and crossing the state line once a year. A number of preventive and remedial measures were suggested, with preference for the preventive approach, to reduce the sediment load in the river. (Garrison-Omniplan)

VELOCITY PROFILES WITH SUSPENDED SEDIMENT,

Science and Education Administration, Oxford, MS. Sedimentation Lab.
N. L. Coleman.
Journal of Hydraulic Research, Vol 19, No 3, p 211-229, 1981. 10 Fig, 3 Tab, 27 Ref.

Descriptors: *Velocity coefficients, *Suspended sediments, Karman coefficient, Channel flow, Open channels, Richardson number, *Open channel flow.

Experiments were conducted on the effect of suspended sediment on velocity profiles. The findings indicate that the Karman coefficient does not decrease with increasing suspended sediment concentration, even though the velocity profile does respond to the presence of suspended sediment by changing shape. The currently accepted forms of the law of the wall and the velocity defect law contain wake flow terms in addition to the original Prandtl-Karman forms. These terms account for the deviation of the velocity defect laws from the logarithmic form in the outer part of the boundary layer in an open channel flow. The existence of these terms emphasizes the need to evaluate the Karman coefficient from straight line fits to experimental velocity profiles in the lower 15% of the flow, in the region where the wake flow terms are negligible, and not out in the more central regions of the flow. The Karman coefficient remained essentially constant over a range of conditions from flows with no sediment in suspension to flows carrying a near capacity load of suspended sediment. The new data also shows that the wake strength coefficient, for uniform nonseparating flows, varies directly with the gross-flow Richardson number. This indicates the presence of suspended sediment capable of reducing turbulence effects in the outer part of the flow. (Baker-FRC)

2K. Chemical Processes

LAKE ERIE NEARSHORE WATER CHEMISTRY AT NANTICOKE, ONTARIO, 1969-1978,

Ontario Ministry of the Environment, Toronto. Water Resources Branch.
I. W. Heathcote, R. R. Weiler, and J. W. Tanner.
Journal of Great Lakes Research, Vol 7, No 2, p 130-135, 1981. 4 Fig, 1 Tab, 20 Ref.

Descriptors: *Water analysis, *Lakes, *Lake Erie, Ontario, *Nanticoke, Nearshore processes, Water chemistry, Phosphorus, Nitrogen, Seasonal variation, Environmental effects, *Chemical analysis.

The results and conclusions of the first 10 years of the Nanticoke water chemistry program are reviewed. The authors of the Nanticoke water chemistry reports used a fixed-factor, two-way analysis of variance without replication to assess the significance of between-date and between-station variability in the levels of water chemistry parameters. Additional statistical methods were employed in this study to elucidate spatial variability in the Nanticoke water chemistry data. No significant long-term trends were found in phosphorus levels in the nearshore waters of Lake Erie at Nanticoke. Despite total phosphorus concentrations of almost 20 micrograms/liter, the area around Nanticoke and Long Point Bay is the only region in Lake Erie that is classified as being in the oligotrophic to mesotrophic range on the basis of total phosphorus, chlorophyll a, and Secchi disk transparency. This is attributed to the influence of the open lake circulation east of Long Point and to a drainage basin that does not contribute much phosphorus and sediment to the lake. All the water quality parameters measured at Nanticoke have met the Ontario and IJC water quality objectives for at least the four years from 1975 to 1978. While water chemistry was similar at all the Nanticoke sampling stations, the stations fell into offshore and nearshore groups on the basis of differences in Secchi disk transparency and total Kheldahl nitrogen. Levels of most water chemistry parameters varied with the seasons. Specific conductance, chloride, and turbidity decreased over the 10 yr study. Phytoplankton density increased. Temperature, dissolved oxygen, pH, nitrate plus nitrate, Kjeldahl nitrogen, ammonia, total phosphorus and filtered reactive phosphorus did not change significantly. (Baker-FRC)

INTERACTIONS BETWEEN LUGOL'S FIXATIVE AND ETHYLENE IN THE ACETYLENE-REDUCTION ASSAY FOR NITROGENASE ACTIVITY IN LAKE WATER,

Lund Univ. (Sweden). Limnological Inst.
L. Leonardson.
Canadian Journal of Microbiology, Vol 26, No 5, p 599-605, 1980. 5 Fig, 5 Tab, 11 Ref.

Descriptors: *Chemical analysis, Sample preservation, Nitrogen fixation, Nitrogen, Enzymes, *Lakes, Chemical reactions, *Ethylene, *Phytoplankton, Byajon Lake, *Sweden.

For performing the acetylene-reduction assay of nitrogenase activity in aquatic organisms, Lugol's solution is a practical and efficient fixative. However, correction must be made for the solubility of ethylene in the liquid phase and reactions between Lugol's solution and ethylene. The purpose of this study was to determine the extent of the loss of ethylene and the effects of phytoplankton concentrations and storage conditions. Water for the study was taken from Lake Byajon in Scania, Sweden. The studies indicated that the solubility of ethylene in the liquid phase of samples cannot be neglected if a realistic assessment of aquatic nitrogen fixation is desired. Since ethylene is unsaturated and highly reactive, care must be taken to use reagents that will inhibit the nitrogenase enzyme. Both solubility and chemical reactions contribute to the decrease of the ethylene content of the vapor phase during long-term storage. The loss of ethylene to mixtures of water and Lugol's solution can be overcome by using a standardized technique and storing samples under defined conditions until analysis. The true ethylene production in the incubation vessel can then be calculated after determination of solubility and long-term reaction patterns for the actual experimental design. (Baker-FRC)

MAJOR ION CHEMISTRY IN A TROPICAL AFRICAN LAKE BASIN,

Nairobi Univ. (Kenya). Dept. of Botany.
J. J. Gaudet, and J. M. Melack.
Freshwater Biology, Vol 11, No 4, p 309-333, August, 1981. 10 Fig, 14 Tab, 64 Ref.

Descriptors: *Lake basins, *Chemical analysis, Sodium, Chemistry of precipitation, Africa, Calcium, Sulfates, Chlorides, Water analysis, Precipitation, Sediments, Tropical zone, Tropical regions, Climatic zones, Rainwater, *Lake Naivasha, *Kenya, *Chemical composition.

The object of this research was to quantify differences in chemical composition of waters of the Naivasha basin. The basin lies between the two flanks of the Eastern or Gregory Rift Valley. Lake beds are composed of reworked volcanic material

or subaqueously deposited pyroclastics and organic matter produced locally. The climate is warm and semi-arid. The lake area has become an important area for intensive vegetable production under irrigation. The Naivasha basin contains four topographically distinct bodies of water. The mean chemical composition in mg/liter of bulk precipitation collected on two transects across the rift valley near Lake Naivasha and at three stations near Nairobi was: Na, 0.54; K, 0.31; Ca, 0.19; Mg, 0.23; sulfate, 0.72; and chloride, 0.41. The major inflow was largely a solution of bicarbonate, sodium, and calcium and carried a total dissolved solids load of 62 kg/ha in 1973 and 120 kg/ha in 1974. Among standing waters sodium and bicarbonate predominated; the total dissolved solute content increased from a low under the northern papyrus swamp to intermediate in Lake Naivasha to a high in Oloidien Lake. The freshness of Lake Naivasha was due to a large fraction of water in the lake coming from dilute rivers and rain. The fact that the lake does not lie in a closed basin but loses water and solutes through seepage, and that exchange with sediments in both the pelagic and littoral regions is a major route for solute movement leading to accumulation on the lake bottom. (Baker-FRC)

GEOCHEMICAL EVIDENCE ON THE NATURE OF THE BASEMENT ROCKS OF THE SIERRA NEVADA, CALIFORNIA,

Geological Survey, Menlo Park, CA. Water Resources Div.
I. Barnes, R. W. Kistler, R. H. Mariner, and T. S. Presser.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.25 in paper copy. Geological Survey Water-Supply Paper 2181, 1981. 13 p, 6 Fig, 7 Tab, 70 Ref.

Descriptors: *Geochemistry, *Foundation rocks, *Springs, *Carbon dioxide, Geohydrology, Geologic formations, Geologic control, Stable isotopes, Water analysis, Chlorides, Water quality, Chemical analysis, *California, Sierra Nevada Mountains, Klamath Mountains, Batholith.

Carbon dioxide-rich waters from 10 of 17 sampled Sierra Nevada soda springs have high concentrations of magnesium, are saturated with amorphous silica, and have temperatures near the mean annual air temperature. This combination is unique to the phase assemblage serpentine-water-carbon dioxide and requires either an isothermal gradient in the ground water and adjacent rocks or shallow depth to the serpentinite. Magnesium concentrations are lower than those found in soda spring water under similar physical and chemical conditions in lizardite-chrysotile serpentinite terranes; therefore, the serpentinites under the Sierra Nevada may be antigorite. Calcium concentrations are in the range of 120 to 620 mg/L probably from calcite-bearing rocks being dissolved by the water; the strontium-isotope values for some of the spring waters are consistent with the calcite being of Middle Devonian to early Mesozoic age. Low strontium-isotope values suggest that the metamorphic rocks beneath the plutons are free of muscovite because carbon dioxide-rich waters that issue from metamorphic rocks containing both biotite and muscovite have much higher strontium-isotope values than waters that issue from granitic rocks containing biotite but no muscovite. The waters have deuterium and oxygen-18 values identical with modern meteoric water but contain high chloride concentrations (up to 2500 mg/L). This combination requires mixing of meteoric waters with a brine of at least 100,000 mg/L chloride. Such brines are usually found in clastic rocks of marine origin. High boron (up to 33 mg/L) and readily detectable bromide and iodide confirm the presence of marine clastic rocks (now metamorphosed) beneath 11 of the springs. (USGS)

CHEMICAL QUALITY OF GROUND WATER IN SAN JOAQUIN AND PART OF CONTRA COSTA COUNTIES, CALIFORNIA,

Geological Survey, Menlo Park, CA. Water Resources Div.
S. K. Sorenson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-124330, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 81-26, June, 1981. 32 p, 9 Fig, 8 Tab, 14 Ref.

Descriptors: *Water quality, *Groundwater, *Chemical analysis, *Wells, Water sampling, Geohydrology, Water use, Water quality standards, Trace elements, Water types, *California, Sacramento Valley, San Joaquin County, Contra Costa County.

Chemical water-quality conditions were investigated in San Joaquin and part of Contra Costa Counties by canvassing available wells and sampling water from 324 representative wells. Chemical water types varied, with 73 percent of the wells sampled containing either calcium-magnesium bicarbonate, or calcium-sodium bicarbonate type water. Substantial areas contain ground water exceeding water-quality standards for boron, manganese, and nitrate. Trace elements, with the exception of boron and manganese, were present in negligible amounts. (USGS)

130,000-YR CONTINUOUS POLLEN RECORD FROM CLEAR LAKE, LAKE COUNTY, CALIFORNIA,

Geological Survey, Menlo Park, CA.
D. P. Adam, J. D. Sims, and C. K. Throckmorton.
Geology, Vol 9, No 8, p 373-377, August, 1981. 3 Fig, 1 Tab, 23 Ref.

Descriptors: *Lake sediments, *History, *Climatology, Trees, *Pollen, Sediments, Sampling, Cores, Clear Lake, California.

A pollen analysis of core 4 (a 115 m core) sediment from Clear Lake, California, revealed a climatic record that was continuous for 130,000 years. Migrations of the tree species of the california coast Ranges were seen in response to climatic changes due to the glacial cycle. The 165 samples from the 115-m core indicated that during interglacials, pollen in rain was dominated by oak, while in cooler periods it was dominated by pine. The natural vegetation in the area at present is a blue oak-digger pine forest. The curve for oak pollen over the 130,000 years resembled and can be correlated with both deep-sea oxygen-isotope curves and the climatic record from certain European pollen studies. (Small-FRC)

GEOCHEMISTRY OF AMINO ACIDS IN SEDIMENTS FROM CLEAR LAKE, CALIFORNIA,

Geological Survey, Menlo Park, CA.
D. J. Blunt, K. A. Kvenvolden, and J. D. Sims.
Geology, Vol 9, No 8, p 378-382, August, 1981. 3 Fig, 3 Tab, 21 Ref.

Descriptors: *Lake sediments, *Geochemistry, *Amino acids, Geologic history, *Pollen, Clear Lake, California, Sampling, Sediments, Cores.

The results of amino acid geochemistry are reported with application to deochronology in core 4 sediments of Clear Lake (California). Aspartic acid and alanine were considered in detail to clarify uncertainties in correlations of ash beds and pollen spectra in lacustrine sediment. Relative concentrations of aspartic acid decreased with depth, probably due to diagenesis and to preferential adsorption and hydrolysis in clay. Alanine increased with depth, probably because of the generation of alanine during diagenesis of other amino acids. When age assessment is based on alanine, results support a time-depth curve obtained from oak pollen and oxygen isotopes over a span of about 130,000 years. (Small-FRC)

ELECTRON INTENSITY, THE ROLE OF HUMIC ACIDS IN EXTRACELLULAR ELECTRON TRANSPORT AND CHEMICAL DETERMINATION OF PE IN NATURAL WATERS,

Toronto Univ. (Ontario). Dept. of Zoology.
A. P. Zimmerman.
Hydrobiologia, Vol 78, No 3, p 259-265, 1981. 4 Fig, 1 Tab, 22 Ref.

Descriptors: *Humic acids, *Oxidation-reduction potential, Electron transport, Organic matter, Organic acids, Chemical potential, Lake sediments, Lakes, Sediments, Chelation, Mercury, *Georgia.

Humic acids were capable of accepting and donating electrons across a wide range of potentials (-1.2 to +0.8 V), including the entire range encountered in aquatic systems. Evolution of Hg, using Hg(NO3)2 as the terminal electron acceptor, was highest, 60%, in the combination, humic acid plus SnC12. Hg evolution in other flasks was as follows: control (Hg alone), sediments, humic acids, sediment plus NaBH4, and humic acids plus NaBH4, all < 10%; SnC12, NaBH4, ascorbic acid, each 10-20%; sediment plus ascorbic acid, 35%; and sediment plus SnC12 and humic acids plus ascorbic acid, 30-40%. In biological systems Hg evolution after 168 hours varied between 2 and 12% in the increasing order: low Hg, high Hg, low Hg plus sucrose, low Hg plus humic acids, high Hg plus humic acids, high Hg plus sucrose, low Hg plus humic acids plus sucrose, and high Hp plus humic acids plus sucrose. In the case of humic acid complexes with 2-p-iodophenyl-3-nitrophenyl-5-phenyltetrazolium chloride (INT), an electron sensitive dye, the pE is dependent only on the negative log of the ratio of oxidized to reduced dye. PE's were chemically determined for sediments in 3 Georgia lakes. They were: Jackson (highly productive, heavy sediment loads), -10 to +4; Burton (dilute, low ionic strength), 0 to +5; and louise (acidic, with organic ligands), 0 to +4. (Cassar-FRC)

WATER QUALITY OF A SOUTHEAST TEXAS STREAM,

Lamar Univ., Beaumont, TX. Dept. of Biology.
D. Bass, and R. C. Harrel.
Hydrobiologia, Vol 76, 1/2, p 69-79, 1981. 1 Fig, 5 Tab, 21 Ref.

Descriptors: *Water quality, *Streams, Chlorides, Bacteria, Coliforms, Feces, Benthos, Runoff, Rainfall, Dissolved oxygen, Seasonal variation, Baseline studies, *Menard Creek, Polk County, *Texas.

A determination was made of baseline water quality data in Menard Creek, with attempts to establish downstream and seasonal trends in water quality and locate existing and potential sites of pollution. Menard Creek originates in central Polk County of southeast Texas and flows 77 km through Hardin and Liberty counties into the Trinity River. The vegetation is that characteristic of the river floodplain forest and slope forest of the Big Thicket, a National Preserve. Samples were taken from Menard Creek during July 1978 to June 1979. In general the physicochemical conditions indicated good water quality. Menard Creek was characterized by an intermediate number of taxa (12) and intermediate to high species diversity. Depression in diversity was directly related to high discharge and not to poor water quality. The fauna was composed of large numbers of pollution intolerant taxa and many more insects than oligochaetes. Numbers of fecal bacteria were higher than acceptable for contact recreation at all sampling stations during much of the study period. Highest numbers were generally found after heavy rains and surface runoff. Fecal coliform to fecal streptococci ratios indicated human contamination in 53% of the 60 samples, while non-human contaminations were found in 12% of the samples. Dissolved oxygen concentrations were always high, and all other parameters were within the expected ranges for small streams in the area. Conductivity and chlorides indicated low concentrations of oil field brines at two sampling sites. (Baker-FRC)

FRESHWATER INPUTS AND ESTUARINE PRODUCTIVITY,

Rhode Island Univ., Kingston. Graduate School of Oceanography.
S. W. Nixon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol I, October, 1981. p 31-57, 8 Fig, 5 Tab, 86 Ref.

Descriptors: *Estuarine environment, *Primary productivity, *Eutrophication, *Nutrients, Water circulation, River flow, Wetlands, Salt marshes, Secondary productivity.

The processes responsible for the high level of production characteristic of estuarine systems are not yet well understood. There are at least five major hypotheses which have been put forward to account for estuarine production, including the fertilizing effect of nutrients in fresh water, advection of nutrient rich offshore water, the trapping of nutrients in estuarine circulation, the outwelling of nutrients from salt marshes and other wetlands, and the rapid recycling of nutrients within the estuary. The remarkable similarity of primary and (to a lesser degree) secondary production levels among estuaries with widely varying fresh water inputs, hydrodynamic properties, and geographical and geological characteristics suggests that a more general feature of estuarine systems is most important in enhancing production in these areas. While river inputs may contribute to the spring bloom, most of the production in many estuaries appears to take place during the warmer months and to be supported by recycled nutrients. Because remineralization appears to be a slower process than the formation of new organic matter, it may be that heterotrophic processes play an important role in regulating the primary production of estuaries, and that the similarity of carbon fixation rates in various estuaries arises because of some common limit on the rate of nutrient recycling. More attention also needs to be given to the problem of understanding the relationship between short-term processes, such as annual production or regeneration, and longer term processes, such as the continuous input of nutrients from rivers and anthropogenic sources. Descriptors: *Estuarine environment, *Salinity, *Phytoplankton, *River flow, *Model studies, Water currents, Low flow, High flow, Biomass, Chlorophyll a, Tidal effects, *Hudson River estuary.

Phytoplankton biomass variations in estuaries are primarily the result of material fluxes due to estuarine circulation and fluxes due to biological and particulate processes (growth, sinking, and grazing). Thus freshwater effects on estuarine circulation can be translated to effects on phytoplankton biomass if the relative contribution of circulation-related fluxes is known. A two dimensional box model was used to describe variation of phytoplankton biomass in the lower Hudson Estuary under different flow conditions. Both the flux contribution of estuarine circulation and other gain or loss processes are quantified by the model. Lag between gauging data and freshwater flow in the estuary, the vertical structure of current velocity and salinity, and the tidal variation of salinity in each layer were considered in the estimation of model parameters. Results indicate that estuarine circulation was strong and flushing times relatively short under both high and low flow conditions. Biomass fluxes in terms of chlorophyll a were dominated by boundary inputs during high flow and by growth and grazing during low flow. The good agreement found between independent measurements of specific rates and specific rates estimated from the model indicates that the model gives a reasonable description of estuarine phytoplankton processes, and may be applicable in other estuaries. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol. I, October, 1981, p 436-452. 7 Fig, 4 Tab, 8 Ref.

Descriptors: *Aquatic animals, *Estuarine environment, *Scour, *Sediment erosion, *Flushing, Spoil disposal, Tidal effects, Fish, River flow, *Columbia River estuary.

Substantial scouring of estuarine sediment occurs from flushing of the Columbia River, which has an annual spring freshet of 20,300 cu m/s. The effect is heightened by diurnal marine water intrusion combined with spring tides having ranges exceeding 3 M. Estuarine depth is maintained by these forces at the end of jetties, promontories, and adjacent bridge openings. Hydraulic stress in these areas suggests biological instability, a low standing crop and occupancy by species tolerant of such physical conditions. Because inwater sediment disposal at sites with low biological activity is preferable to deposition at biologically rich and stable sites, scour sites were investigated for potential dredge deposition. Biological inventories of aquatic life were conducted in October-November 1978 and May 1979, at four diverse scour sites in the Columbia River Estuary. Benthic fauna, epifauna, and pelagic fish were studied as well as food utilization of dominant finfish. Inventory studies indicated low suitability for sediment deposition due to biological richness at the Tonuge point and Interstate Bridge sites. Jetty A site was biologically poor, and has potential suitability as a deposition site. Tansy Point site may be suitable for deposition at predetermined times. Inventory evaluation studies should be tested under controlled deposition conditions preceding sustained usage. (Moore-SRC)

Descriptors: *Nutrients, *Estuaries, *Tidal marshes, *Tidal effects, Carbon Nitrogen, Phosphorus, Seiches, Seasonal variation, Fluctuations, *Texas.

Movements of carbon, nitrogen, and phosphorus in the surface waters between a tidal marsh and the Nueces estuary, Nueces County, Texas, were studied over an 8-month period (October 1978-June 1979). Nutrient transport in the Nueces marsh appears to be rather atypical when compared to other high salinity riverine marsh systems. It is characterized by infrequent and incomplete inundation by both flood and tidal waters and tends to serve as a nutrient sink. Seasonal patterns in nutrient flux were evident throughout the study period. Net fluxes of virtually all nutrient parameters were directed out of the marsh during the fall and winter, but were directed into the marsh during the spring. Combined net input of C, N, and P in the spring and summer ranged from 33 to 571 kg/hr. Tidal fluctuations in the Nueces estuary are normally low (0-60 cm). Nutrient concentrations within a tide are not as critical to the determination of net flux as is the flow rate between flood and ebb tides. Flows in and out of the marsh are for the most part attributable to tidal action, and to a lesser extent to wind seiche. (Moore-SRC)

ESTUARINE BENTHIC COMMUNITY DYNAMICS RELATED TO FRESHWATER INFLOW TO THE CORPUS CHRISTI BAY ESTUARY,

Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
R. W. Flint, and S. C. Rabalais.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Fresh-

water Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol I, Oct. 1981, p 489-508. 11 Fig, 15 Ref.

Descriptors: *Estuarine environment, *Salinity, *Rainfall, *Benthic fauna, Shrimp, Streamflow, Runoff, Biomass, Productivity, Nutrients, *Corpus christi Bay estuary Texas.

During the 24-hr period beginning with the evening of 18 September 1979, an extensive low pressure system engulfed the south Texas coast and heavily impacted the Corpus Christi area with tropical storm-intensity rains that reached as much as 33 cm accumulation in 24 hr. This produced a large amount of riverine input and land runoff to Corpus Christi Bay, dramatically decreasing salinity below normal levels for more than a month. The existence of an historical data base on benthic infauna for this estuary allowed an investigation to be conducted concerning effects of this intensive freshwater inflow on the estuarine benthos. Several months after the inflow event, densities of dominant infaunal populations increased to levels never observed, and productivity of the benthos, as represented by biomass changes, increased substantially over previous years. The nutrients associated with the intense freshwater inflow may have increased the primary productivity of the estuarine ecosystem. The increased productivity was, in turn, eventually reflected by the benthos. These data may provide a missing link in the correlations between freshwater inflow events in south Texas estuaries and yields of some of the important fisheries, such as shrimp. (Moore-SRC)

THE EFFECTS OF FLOODS ON THE ZOOPLANKTON ASSEMBLAGE OF SAN ANTONIO BAY, TEXAS DURING 1972 AND 1973,

National Marine Fisheries Service, Galveston, TX.
G. A. Matthews.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol I, Oct. 1981, p 509-525. 6 Fig, 3 Tab, 5 Ref.

Descriptors: *Zooplankton, *Estuarine environment, *Floods, *Salinity, Flushing, Aquatic animals, Environmental effects, Floodwater, Population density, *San Antonio Bay, Texas.

With the increasing use of estuaries for various economic purposes, it has become essential to know what to expect when certain environmental factors change. In order to study the effects of floods on an estuary, plankton tows and hydrographic measurements were taken encompassing a single flood in 1972, and three floods in 1973 in San Antonio Bay, Texas. The shallow bay was rapidly flushed by influx of flood waters as was indicated by reductions in salinity and in the densities of the dominant species, Acartia tonsa. Floods replaced the typical estuarine zooplankters with freshwater ones. During the 1972 flood, total zooplankton densities fell from 10,800/cu m before the flood to 3,400/cu m after the flood, but they increased rapidly when the river flow returned to base level. After the three floods in 1973, a cumulative decrease in total density of over two orders of magnitude was found. There had been insufficient time to reestablish pre-flood densities between each flood. The rapidity with which densities were reestablished and the areas in which these increases were first found indicates the majority of the density changes were due to influx of zooplankton-rich bay water from Espiritu Santo Bay, rather than from population explosion by surviving refuge populations. The seasonal occurrence of a flood may severely reduce the survival of a bay's annual recruitment of economically important species whose larval stages are members of the zooplankton or which depend on zooplankton as food. It is important to note the interdependency of these estuaries, as currents carry life from one into the next. (Moore-SRC)

THE INFLUENCE OF SALINITY TRANSITION ON BENTHIC NUTRIENT REGENERATION IN ESTUARIES,

Rosenstiel School of Marine and Atmospheric Science, Miami, FL.
R. E. Edwards.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service. Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 2-16. 78 Ref.

Descriptors: *Salinity, *Nutrients, *Regeneration, *Benthic environment, *Estuaries, Mineralization, Cycling nutrients, Sediments.

Sediment nutrient regeneration can be divided into three categories of processes: mineralization, mobilization, and release. Mineralization occurs primarily through biological processes, so any salinity effect on benthic metabolism will affect mineralization. Salinity transition can influence mobilization directly through physical/chemical mechanisms or indirectly through its effects on biological functioning. The predominant release process is molecular diffusion which is affected only indirectly by salinity transition, but it does significantly affect the release processes of convective overturn, bioturbation, and ebullition. Because of the complexity of the interrelationships and the lack of data few generalizations can be made. The effects of salinity transition should be a function of the absolute value of the salinity change, and the rate of change. Transition to increased salinity should cause more rapid change and more immediate changes in nutrient regeneration. Salinity transition is expected to have the greatest impact in the oligohaline (0.5 - 5.0 ppt) portion of the estuary, as the benthic organisms in this environment are the most sensitive to salinity changes. In: Proc. of the National symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 41-53. 5 Fig, 2 Tab, 9 Ref.

Descriptors: *Saline water intrusion, *Columbia River estuary, *River flow, *Tides, *Estuaries, Data acquisition, Dredging, Environmental effects, Aquatic life, Estuaries.

Salinity intrusion studies were conducted in 1977 because of the predicted record low flows of the Columbia River, the removal of 6.9 million cu m of sediment from the Columbia River bar, and the need for data for model verification. The 1978 studies were for comparison purposes. Monthly neap tides produced the highest concentrations with the longest durations and furthest upstream intrusions of saline waters. The maximum intrusion of salinity at 2 ppt was 26.5 miles, and it exceeded 20 miles in all of the eight surveys. The highest salt concentration measured was 34.2 ppt at Tongue Point, a record level for the estuary. The concentration, extent and duration of salt water intrusion into the middle and upper Columbia River exceeded previous measurements, and salinities were higher on the south side of the channel rather than on the north. These changes may have effects on the distribution of benthic and pelagic fish and shellfish, with subsequent environmental and economic effects. Continued investigations are necessary to monitor any changes and predict their effects. (Brambley-SRC)

Descriptors: *Estuaries, *Suspended solids, *San Francisco Bay, California, *Nutrients, Salinity, Particulates, Carbohydrates, Proteins, Detritus, Zooplankton, Distribution.

A study was conducted to investigate the relationship between the distribution of nutritionally important suspended particulate matter and the area of the entrapment zone in upper San Francisco Bay estuary. The biochemical characteristics of the particulate material were measured monthly for a year at salinities of 0, 2, 4, 6, and 10 ppt. The particulate matter was size fractioned into two categories: 0.5 to 15 microns and 0.5 to 120 microns. Samples were analyzed for chlorophyl a, ATP, protein, carbohydrate, and particulate organic and inorganic carbon concentrations. At all salinities evaluated, an average of 78% of the protein and 75% of the carbohydrate was found in the 0.5 to 15 microns size fraction. From July through December the highest concentrations of suspended particulate matter were reported for the intermediate salinities of 4 and 6 ppt, indicating the presence of an entrapment zone at these salinities. The highest concentrations, of the biochemical components analyzed, occurred in the entrapment zone, except for carbohydrate and detrital carbon. The nutritional quality of the particulate matter, as measured by the protein/carbohydrate ratio, was higher in the entrapment zone than in adjacent upstream or downstream locations. The distribution of filter-feeding zooplankton over the same salinity range indicated rotifers and calanoid copepods were not significantly different between the salinities evaluated. Eurytemora hirundoides was the dominant adult copepod in the entrapment zone. The results indicate the entrapement zone is a nutritionally enhanced area for filter feeders in the estuary. Not all species studied appeared to be able to utilize this resource due to physiological requirements which restrict them to salinities higher or lower than the entrapement zone location. Descriptors: *Estuaries, *River flow, *Salinity, *Saline water intrusion, Oysters, Sea level, Land use, Water demand, Climates, *Chesapeake Bay, Freshwater inflow.

Evidence, from fauna buried beneath the upper Chesapeake Bay and from the presence of Crassostrea shell middens upstream from the low salinity limit of oysters, demonstrates that salinity in the estuary has been higher than it is at present. The salinity of the water was deduced from the presence and type of boring sponge holes. The age of the zone 1-2 m below the bottom was radiocarbon dated as 545 plus or minus 90 yr BP. Below this zone the sponge borings increase and then decrease. This is not consistent with a uniform rising sea level-rising estuarine salinity model. Changing land use in the upstream basins of both the Susquehanna and Delaware Rivers can be shown to produce significant modifications in peak and low freshwater discharges. The cause of the salinity excursion is not known, but changing land use, climate and competing demands for fresh water are suggested. (Brambley-SRC)

In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 322-334. 7 Fig, 7 Ref.

Descriptors: *Estuaries, *Estuarine environment, *Salinity, *Rainfall distribution, *Climates, Drought, Ecosystems, Climatic zones.

This study investigated the semiarid region of south Texas and northeastern Mexico to determine any detectable cycles or climatic periodicities, and whether they have been significant. Since there were no discernible trends in temperature, precipitation figures were studied. Both south Texas and northeastern Mexico showed precipitation trends. In south Texas there was a 25-year moist period starting in 1922, and a drought during the 1950's. In Mexico the years 1927-1945 were consistently moist, and there was a 20-year dry period starting in 1945, followed by a 10-year moist period. The rainfall in the Baffin Bay area was found to be variable and nonuniform in distribution. This results in the estuarine water being either hypersaline in dry conditions or hyposaline in wet conditions and in an extraordinarily dynamic complex estuarine ecosystem. (Brambley-SRC)

Descriptors: *Estuarine environment, *Ecosystems, *Rainfall, *Fish, *Crustaceans, Salinity, Predation, Statistical models, Temperature, Fishkill.

Between 1972 and 1978, changes in fish and crustacean populations of Cedar Bayou Electric Generating Station's cooling lake on upper Galveston Bay seemed related to rainfall rates during winter and spring. Wetter years favored populations of young migratory fishes and crustaceans; larger, predatory fishes tended to be more abundant during dry years than during wet years. This pattern is consistent with the hypothesis that part of the upper bay's value as nursery grounds derives from their low salinities which repulse larger fishes, thereby protecting juvenile organisms from intense predation. Dynamics of the cooling-lake community responded also to variation in the power plant's T (the difference between upper discharge-canal and intake-area temperatures) and to the occurrence of infrequent fish kills. A trend model of system dynamics was formulated and tested for internal consistency. There was greater agreement among the biotic elements than for the model as a whole. Complexity is added by the selective filtering action of the steam-electric power plant through which all immigrants to the community must pass, and by the occurrence of fish kills. (Brambley-SRC)

Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 402-418. 8 Fig, 1 Tab, 1 Ref.

Descriptors: *Estuarine environment, *Estuarine fisheries, *Shrimp, *Habitats, *Drainage ditches, *Rainfall, Salinity, Juvenile growth stage, Environmental effects, Aquatic productivity, Drainage effects, Ecological effects.

Four sampling stations were established in tributaries of northern Pamlico Sound, to measure the effects of upland drainage on primary nursery areas. The four stations received either heavy, moderate, or no drainage through man-made water courses. All stations functioned as primary nursery areas during periods of low rainfall and high salinity (1977). Brown shrimp production at all sites was depressed during periods of extremely high rainfall and low salinities (1978). Salinities at the unaltered sites were more stable during periods of high runoff than those recorded at two sites receiving drainage through ditches. Recovery times at the altered sites were approximately 10 days. The most significant reduction in production of juvenile brown shrimp occurred at the extensively ditched site during periods of moderate to heavy rainfall. There were no mass or complete movements of juvenile shrimp from the nursery areas as a response to rapid changes in salinity. The most serious effects of drainage into nursery areas appear to be the degree of alteration and the danger that alteration will be severe enough to create an unsuitable habitat during periods of normal rainfall. A NUMERICAL SIMULATION OF THE VERTICAL AND HORIZONTAL M2 TIDE IN THE BRISTOL CHANNEL AND COMPARISONS WITH OBSERVED DATA,

Institute for Marine Environmental Research, Plymouth (England).
R. J. Uncles.
Limnology and Oceanography, Vol 26, No 3, p 571-577, May, 1981. 2 Fig, 27 Ref.

Descriptors: *Mathematical models, *Tidal currents, *Estuaries, Tidal rivers, Water currents, Tidal effects, Mathematical studies, *Bristol channel, *Severn Estuary, United Kingdom, Comparison studies.

Observed and modeled currents are compared for the M2 tide in the Bristol channel and Severn Estuary (United Kingdom). Currents were measured; data were analyzed in terms of the M2 tidal ellipses, and depth averaged values were estimated. A depth-averaged hydrodynamical numerical model was used to simulate the M2 tide. When computed and observed vertical M2 tides were compared, the amplitudes were accurate to within 4%. Computed and observed current ellipse phases were not significantly different. The computed tidal currents can be used to estimate the magnitude of the tidally averaged frictional stress at the seabed. Also, the rate of dissipation of tidal energy per unit mass of water column can measure the vertical mixing due to tidal flow. This can be used to parameterize the location of frontal regions separating thermally mixed and thermally stratified water masses during the summer. (Small-FRC)

SEASONAL VARIATION OF VITAMIN B12, B12 ANALOGS, AND PHYTOPLANKTON IN A LONG ISLAND ESTUARY,

New York Ocean Science Lab., Montauk.
S. F. Bruno, R. D. Staker, and L. L. Curtis.
Journal of Marine Research, Vol 39, No 2, p 335-352, May, 1981. 4 Fig, 5 Tab, 40 Ref.

Descriptors: *Seasonal variation, *Vitamins, *Phytoplankton, *Estuaries, Bioassay, Diatoms, Regression analysis, Peconic Bay, Vitamin B12, *Peconic Bay estuary, Long Island, New York.

The seasonal distribution of dissolved vitamin B12 and its analogs was determined in Peconic Bay estuary, Long Island, New York, and the significance of these cobalamins with respect to phytoplankton populations is discussed. Water samples were collected from nine stations from August 1976 to April 1978. Phytoplankton cell counts and identifications were made using a nanoplankton counting chamber, and concentrations of dissolved B12 and B12 analogs were determined by bioassay using the diatom Thalassiosira pseudonana Hasle et Heimdal, Clones 3H and 13-1. Regression analyses did not show any consistent correlation of phytoplankton population parameters with dissolved B12 or B12 analogs. Vitamin B12 is probably not important in limiting phytoplankton growth rates, and this explains the lack of correlation between B12 and phytoplankton parameters. There are possible autocthonous and allocthonous mechanisms for the introduction of cobalamins into the bay system. (Small-FRC)

ZOOPLANKTON SAMPLE VARIABILITY IN A TIDAL ESTUARY: AN INTERPRETATIVE MODEL,

Laval Univ., Quebec. Dept. of Biologie.
M. Gangnon, and G. Lacroix.
Limnology and Oceanography, Vol 26, No 3, p 401-413, 1981. 8 Fig, 2 Tab, 22 Ref.

Descriptors: *Tidal effects, *Zooplankton, *Estuaries, Mathematical models, Sampling, Tidal rivers, Statistical analysis, *St. Lawrence River, Quebec.

The effects of tide-related advection processes on zooplankton sample variability were examined in a series of vertical hauls collected at a high sampling rate at an estuarine anchor station during part of a neap-to-spring tide cycle. A mathematical model was used to establish relations between the importance of short term temporal variability and the characteristics and displacements of the zooplankton field in the sampling area. Zooplankton was collected in the upper St. Lawrence River from July 2 to 12, 1975, once every 30 min to yield 347 samples. Data were analyzed using time series analysis, and sample variability was determined. Most of the variability was caused by periodic horizontal advection of zooplankton gradients. Thus, tidal effects on sampling must be considered when designing experiments. (Small-FRC)

ON THE ADVECTION OF TURBIDITY IN THE SAINT LAWRENCE MIDDLE ESTUARY,

McGill Univ., Montreal (Quebec). Inst. of Oceanography.
B. D'Anglejan.
Estuaries, Vol 4, No 1, p 2-15, March, 1981. 13 Fig, 22 Ref.

Descriptors: *Estuaries, *Turbidity, *St. Lawrence Estuary, Suspended sediment, Sedimentation, Tidal currents, Particulate matter, Sediment transport, Advection.

Some physical characteristics of a middle estuary are discussed which influence the advective transport of the particulate suspended matter (PSM). The study area was the region of main turbidity gradient over the South Channel of the middle estuary in the St. Lawrence, between Quebec City and the Saguenay River entrance. The space and time distribution of the turbidity in this estuary appears to be largely determined by its channel physiography, fluctuations in the river discharges, and the tidal wave asymmetry. Three main regions are distinguishable within the broad turbid zone. The geometry of the South Channel consists of a succession of constrictions and widenings which modulate the flow velocity and creates considerable increases in the energy available for sediment transport in regions of constriction. A tidal phase difference across the estuary creates strong shears at the turn of the tide on the crest of the English Banks, facilitating erosion of the plume along its northern boundary and the cross-channel transport of suspended matter from the South into the North channel. Upstream of the main front, tidal fluctuations in the turbidity take place within the plume, with brief intense maxima near low water slack. They coincide with a considerable reduction in stratification, facilitating the upward dispersion of the turbidity from the bottom into the upper layer. The plume is reinforced by the introduction during the ebb of suspended material from inshore waters, and particularly from Sainte Anne Bay. This area provides an important local source of PSM to the plume and helps stabilize the main frontal zone. (Baker-FRC)

THE DYNAMICS OF CONSERVATIVE MIXING IN ESTUARIES,

New Hampshire Univ., Durham. Ocean Processes Analysis Lab.
T. C. Loder, and R. P. Reichard.
Estuaries, Vol 4, No 1, p 64-69, March, 1981. 4 Fig, 16 Ref.

Descriptors: *Estuaries, *Mixing, Dynamics, Mathematical studies, Model studies, *Saline water intrusion, Destratification, Salinity, Chemical composition, Estuarine environment, Flushing.

This paper demonstrates that salinity-constituent mixing curves, produced under conservative or non-reactive mixing conditions in an estuary, may not be linear due to temporal variation in end-member constituent concentrations. Thus the use of mixing curves for the interpretation of estuarine processes must be undertaken with an understanding of the river and ocean constituent variability and their relationship to the estuary's mixing properties and flushing time. A one-dimensional dispersion equation was used to calculate the distribution of salinity and a conservative constituent in a model estuary. Both straight and bent mixing curves are shown, resulting simply from changing the variability of the river constituent concentration. For no variability, the curve is straight. For variability with a period much less than the flushing time, the average curve for a general data set is straight, whereas the curve for a synoptic data set is bent. For variability with a period greater than the flushing time, a bent curve results. (Baker-FRC)

COMPOSITION AND VERTICAL FLUX OF ORGANIC MATTER IN A LARGE ALASKAN ESTUARY,

National Marine Fisheries Service, Beaufort, NC. Beaufort Lab.
A. J. Chester, and J. D. Larrance.
Estuaries, Vol 4, No 1, p 42-52, March, 1981. 5 Fig, 3 Tab, 28 Ref.

Descriptors: *Estuaries, *Organic matter, Sediments, Sedimentation, Bottom sediments, Carbon, Nitrogen, Benthos, Chlorophyll, Estuarine environment, Vertical distribution, Lower Cook Inlet, *Alaska.

The natural and vertical flux of organic particles as they contribute to the benthic food web of a large Alaskan estuary are examined. Sediment traps were used to sample organic detritus settling to the bottom of lower Cook Inlet. Composition and downward flux of this detritus were related to phytoplankton standing stock and primary productivity measured in the ambient water. It supports an extremely productive benthic community rich in commercially harvested populations of snow, king, and dungeness crabs, shrimp, razor clams, scallops and halibut. The most productive region was Kachemak Bay, which also experienced the largest downward flux of organic detritus. The greatest fluxes of fecal pellets, carbon, nitrogen, and plant pigments were measured there. The Bay is noted for abundant benthic populations and is a center for sport and commercial trawling activities. Chlorophyll and chlorophyll degradation products in the water column and sediment traps indicated that about 8.5% of the phytoplankton standing stock was sedimented to the bottom each day in Kamishak and Kachemak Bays. In the central inlet the average loss rate was lower and more variable. The chief mechanism for the downward transport of the material was traced to zooplankton grazing and subsequent fecal pellet production. An increase in carbon:nitrogen ratios from the water column to the sediments suggests that easily digested nutritive compounds are preferentially used as organic matter is transferred through the food web. SEASONAL VARIATION IN THE PREVALENCE OF 'RED SPOT' DISEASE IN ESTUARINE FISH WITH PARTICULAR REFERENCE TO THE SEA MULLET, MUGIL CEPHALUS L.,

Southern Fisheries Research Center, Deception Bay (Australia).
L. J. Rodgers, and J. B. Burke.
Journal of Fish Diseases, Vol 4, No 4, p 297-307, January, 1981. 4 Fig, 2 Tab, 14 Ref.

Descriptors: *Fish diseases, *Fish, *Estuaries, Seasonal variation, Diseases, Bacteria, *Australia, Temperatures, Mullet.

The Noosa River arises directly south of Tin Can Bay and flows through a largely undeveloped region to discharge into Laguna Bay, Australia. Two large shallow lakes, Lake Cootharaba and Lake Cooroibah, damp the flow of the river. Lake Cootharaba acts as a freshwater reservoir which prolongs the period of flood run-off. Sampling of fish was made at two sites, the first near the mouth of the Noosa River and the second at the northern end of Lake Cootharaba. The presence of lesions on the fish was taken as an indication of the occurrence of red spot disease. Infected fish usually displayed a single lesion on the flank or dorsal surface. Multiple lesions were observed upon individual fish. The occurrence of epizootics of vibriosis and other bacterial diseases has in other studies been linked with significant environmental changes. Such a period of significant change was induced by heavy rainfall and associated run-off during the early months of this study. The salinity of the river mouth was depressed to below 5 ppm at a time when low, declining temperatures were also present. Simultaneously, significant levels of infection were present during this period. These levels of infection contrast markedly with those low levels present at the river mouth during the period of November 1976 to February 1977 when relatively high, stable salinities (27 ppm) and temperatures prevailed. The study indicates the significance of factors such as temperature fluctuations, salinity, host movement, spawning and schooling behavior in epizootic occurrences. (Baker-FRC)

DISCUSSION OF TRACE METALS IN THE WATERS OF A PARTIALLY-MIXED ESTUARY,

Washington Univ., Seattle. Dept. of Oceanography.
M. Rattray, Jr., and C. B. Officer.
Estuarine, Coastal and Shelf Science, Vol 12, No 3, p 251-266, March, 1981. 1 Fig, 2 Tab, 17 Ref.

Descriptors: *Estuaries, *Trace metals, *Path of pollutants, Metals, Model studies, *San Fracisco Bay, Bays, Mixing, Advection, Fluctuations, Tidal currents, Salinity.

A generalization is presented of methods commonly used for calculating the estuarine loss (or gain) of a constituent based on the relationship of its distribution to that of salinity. Included in the formulation are the effects of arbitrary cross-sectional shape, tidal drift, gravitational circulation and longitudinal tidal diffusion. Its application depends upon obtaining the sectional distributions of the constituent and of the salinity at two adjacent cross-sections, estimating the magnitude and con-

sediment concentration of the river inputs, and the tide and tidal current data for the region under study. Three cross-sections of the numerical simulation model of San Francisco Bay were used to carry out the calculations and test the results. The results compared favorably wth results from direct flux calculations using the accompanying mean current information. A considerable range in the governing parameters was spanned by these three sections, thus providing good insight into the general applicability of the new formulation. An unusually good data set is provided by these examples. By reducing their spatial coverage it becomes apparent that large errors can possibly occur in the calculated loss rate when the data coverage is less ideal. When the net flux through a section is relatively large compared to the loss rate, this problem is particularly severe. It is at this point nearly in balance with the river supply. When applying this formulation it is suggested that the sensitivity of the final results be assessed as to the accuracy with which the relevant constituent and salinity fields are known. (Baker-FRC)
W82-02542

VARIATION IN LIFE-HISTORY PATTERNS BETWEEN INTERTIDAL AND SUBTIDAL POPULATIONS OF THE MEIOBENTHIC COPEPOD MICROARTHRIDION LITTORALE,
South Carolina Univ., Columbia. Belle W. Baruch Inst. for Marine Biology and Coastal Research.
M. A. Palmer.
Marine Biology, Vol 60, No 2/3, p 159-163, 1980. 6 fig, 1 Tab, 35 Ref.

Descriptors: *Benthic fauna, *Population density, *South Carolina, *Copepods, Microarthridion littorale, Estuarines, *Estuarine environment, Tides, Intertidal areas, Meiofauna.

Reproductive patterns of intertidal and subtidal populations of Microarthridion littorale were compared to ascertain the significance of the following parameters: population density and age structure, adult size, timing of reproduction, number of eggs per gravid female and number of eggs per adult female, and birth and death rates. Densities of M. littorale were significantly greater intertidally during the summer and fall. For the remaining seasons, the population densities did not significantly differ between intertidal and subtidal groups. Intertidal maximum densities occurred in July, whereas maximum densities subtidally were in October. Far greater numbers of eggs per gravid female were recorded in the subtidal populations at all times. Birth and death rates paralleled each other but were high subtidally with the exception of August. It is suggested that these differences resulted from differences in food quality and quantity, increased exposure to potential epibenthic predators subtidally, and exposure to differential competitive pressure in the two areas. (Baker-FRC)

LARGE VERTICAL SALINITY GRADIENTS IN THE FT. PIERCE INLET ASSOCIATED WITH HURRICANE DAVID,
Harbor Branch Foundation, Inc., Fort Pierce, FL.
G. H. Kierspe.
Florida Scientist, Vol 44, No 2, p 104-109, 1981. 4 Fig, 5 Ref.

Descriptors: *Hurricanes, *Estuarine environment, Storms, Salinity, Environment, Coasts, Estuaries, Floods, *Fort Pierce Inlet, *Florida, Saline water intrusion.

The effects of Hurricane David on the vertical salinity gradient in an ordinarily well-mixed inlet are reported. Salinity was measured at different depths in the inlet about 1 wk before and after the passage of the storm, on September 3, 1979. Associated with the hurricane were 22.7 cm of rain and maximum winds of 153 km/hr. The water level at the Ft. Pierce Inlet was about 95 cm above the mean water level recorded prior to the passage of the hurricane. The major freshwater influence on the Inlet is from Taylor Creek, a drainage canal regulated by a series of locks. Vertical mixing is evident in the Inlet by large eddies and upwelling areas caused by bottom irregularities. The prestorm sampling showed the water column to be well mixed. At the end of the ebb, the surface salinity was 34.5 ppt and the bottom was 35.2 ppt, a difference of only 0.7 ppt. After the hurricane, the surface-to-bottom salinity gradient was large during all of the ebb, and the first part of the flood. At slack water after the flood, the water column was homogeneous with a salinity of 34.6 ppt. During the ebb the bottom salinity dropped to 31.0 ppt and the surface salinity reached a minimum of 19.1 ppt, a difference of 11.0 ppt. After the flood tide began, the surface and bottom salinities climbed rapidly to 34.6 ppt. The water column was again homogeneous about 2 hr into the flood tide. The significance of this study is great when one considers the general lack of information on posthurricane effects for an estuarine location. (Baker-FRC)
W82-02569

VERTICAL MIXING RATES IN FJORDS DETERMINED USING RADON AND SALINITY AS TRACERS,
Lamont-Doherty Geological Observatory, Palisades, NY.
W. M. Smethie, Jr.
Estuarine, Coastal and Shelf Science, Vol 12, No 2, p 131-153, 1981. 10 Fig, 4 Tab, 39 Ref.

Descriptors: *Fjords, *Salinity, *Radon, *Mixing, Tidal energy, Tidal effects, Tracers, Tidal hydraulics, Runoff, Saline-freshwater interfaces, Coastal waters, Washington, British Columbia.

The excess radon-222 profiles of several Washington State and British Columbia fjords were measured in attempts to understand the vertical mixing processes of these embayments. During periods of bottom water stagnation, exponential profiles were generally observed. Salinity changes and exponential excess radon profiles of the stagnant bottom water were utilized to calculate values of the vertical eddy diffusivity. Variations in these values which ranged from 0.16 to 36 sq cm/sec among fjords were attributed to different inputs of tidal energy into the vertical mixing process. Excess radon due to freshwater runoff was also found in the surface water of some fjords. For Narrows Inlet, values of the vertical eddy diffusivity were 0.23 to 0.47 sq cm/sec in the surface waters and 0.9 to 3.1 sq cm/sec between 5 and 35 m depth. (Geiger-FRC)

BENTHIC ENRICHMENT IN THE GEORGIA BIGHT RELATED TO GULF STREAM INTRUSIONS AND ESTUARINE OUTWELLING,
Skidaway Inst. of Oceanography, Savannah, GA.
R. B. Hanson, K. R. Tenore, S. Bishop, C. Chamberlain, and M. M. Pamatmat.
Journal of Marine Research, Vol 39, No 3, p 417-441, August, 1981. 1 Fig, 11 Tab, 73 Ref.

Descriptors: *Benthic fauna, *Nutrients, *Distribution patterns, Gulf Stream, *Georgia Bight, Florida, Ocean currents, Estuaries, Particulate matter, Continental shelf, Biomass, Rivers, Organic matter, Deposition, *Coastal waters.

The distribution patterns of benthic life in the Georgia Bight, sampled at 12 sites between the Savannah River, Georgia, and Daytona Beach, Florida, indicated that constant intrusions of nutrient-rich Gulf Stream water at the shelf break are important to the offshore benthic communities. Estuaries, often considered as major nutrient sources to outer continental shelf systems, are probably not effective beyond 20 km off the Georgia coast. Although the presence of Spartina marshes and a large number of major rivers in Georgia would be expected to enrich benthic life off the coast to a greater degree than off the Florida coast, this is not the case. Possible explanations are the low nitrogen content of detritus and the restriction of offshore transport of nutrients by salinity fronts and alongshore currents. Microbiota were 2-3 times more numerous at the shelf break than at the mid shelf and inner shelf and increased southward along the shelf break. Densities were highest in areas of frequent intrusions. 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DESALTING DEMONSTRATION PLANT FEASIBILITY STUDY AT LAGUNA PUEBLO, NEW MEXICO.
MetaMetrics Inc., Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153362, Price codes: A07 in paper copy, A01 in microfiche. Technical Report submitted to Office of Water Research and Technology, March 31, 1981. 124 p, 19 Fig, 39 Tab, 98 Ref. OWRT-C-00255-D(0452)(1), 14-34-0001-0452.

Descriptors: Feasibility study, *Desalination, Desalination plant, *Water supply development, Water quality, Water rights, Water use, Capital costs, Operating costs, Maintenance costs, Project benefits, Regional development, *Cost-benefit analysis, *Laguna Pueblo, Indian reservation, Laguna, *New Mexico, Canoncito, *Groundwater availability.

Water of drinking quality is scarce on the Laguna Reservation, located 20 miles west of Albuquerque, New Mexico. The feasibility of developing a demonstration desalting plant to provide for the water requirements of 2,000 members of the Laguna Pueblo included a review of the existing water resources. Four desalting and three nondesalting alternatives were evaluated. The study included legal, political and socio-economic factors important to developing water supplies in the water scarce environment. Of the brackish water sources, the Rio Puerco was the lowest cost alternative. The fresh water alternatives could provide water at $1.93 per 1,000 gallons of water as compared to $4.01 per 1,000 gallons for desalting. The development of the Rio Grande fresh water aquifer would require the purchase of water rights and the City of Albuquerque could oppose such action.

OPERATING CHARACTERISTICS OF VARIOUS COMBINATIONS OF WORKING SUBSTANCES AND FEEDS IN THE SCHROEDER DESALTING PROCESS.
Schroeder Process Corp., Santa Ana, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153560, Price codes: A06 in paper copy, A01 in microfiche. Final Report prepared for Office of Water Research and Technology, 1981. 123 p, 21 Fig, 4 Ref, 2 Append. OWRT-C-00135-S(0450)(1), 14-34-001-0450.

Descriptors: *Distillation processes, *Vapor compression evaporation, *Vertical tube evaporation, *Freeze process, Waste disposal, Research results, Bench scale, Energy costs, Fixed costs, Water costs estimate, *Desalination, *Desalination apparatus.

A novel process has been discovered which has the potential to combine the advantages of both distillation and freezing processes, without the disadvantages. The process uses a working substance (WS), such as a high melting organic compound, at its freezing point, to effect direct contact evaporation. The purpose of this project was to investigate the operating characteristics of various WSs in the laboratory and a bench scale plant (BSP). A WS screening program tested melting range, solubility, tendency to entrain or emulsify, and stability, in the laboratory program. The BSP program satisfactorily simulated the operation of major pieces of equipment, using WSs that passed the screening program with seawater, and other saline water

feeds. The process is ready for pilot plant design, construction, and operation.

NON-ACID PRETREATMENT AND MANAGEMENT OF MICROORGANISMS IN SEAWATER DESALINATION BY REVERSE OSMOSIS,
Permutit Co., Inc., Paramus, NJ.
A. B. Mindler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153396, Price codes: A05 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, November, 1981. 91 p, 9 Fig, 3 Tab, 5 Ref. OWRT-C-00093-D(0466)(1), 14-34-0001-0466.

Descriptors: *Desalination, *Reverse osmosis, *Seawater, *Scale prevention, *Fouling, *Microorganisms, *Pretreatment of water, Bacteria, Algae, Protozoa, Diatoms, Chlorination, Tannins.

Non-acid pretreatment was studied in a seawater reverse osmosis pilot plant for one year with particular attention to biological aspects. Pretreatment of the tropical surface seawater by in-line coagulation/filtration reduced the Silt Density Index (SDI) consistently below 3.0 in the polishing filter effluent. Subsequent biological activity of periphytic organisms on piping surfaces after addition of organic antiscalants increased SDI by one unit or more. Slough-off of the organisms' polysaccharide sheaths resulted in fouling of the hollow fiber permeators. A 2000 hour run was made with 3 ppm polyacrylate antiscalant at ambient pH of 7.9 on one RO system in parallel with another system at pH 7.5, reduced by addition of 15 ppm sodium bisulfite. A 3000 hour run was made with Quebracho tannin as combined antiscalant/antifoulant under similar conditions. For the last 1500 hours tannin was employed in place of starvation chlorination for intake protection. Both polyacrylate and tannin antiscalants were found to serve as nutrient for bacterial growth and both impaired RO performance. Tannin uniquely decreased the attachment ability of periphytic bacteria. No hard scale was found during autopsy, but a small amount of amorphous calcium salt was detected in potted fiber ends of the permeators and in piggy-back spiral wound elements. Analyses of foulants are reported.

DEVELOPMENT OF HIGH SALT REJECTION REVERSE OSMOSIS MEMBRANES–FINAL REPORT, JULY 1, 1978 THROUGH DECEMBER 31, 1980,
UOP, Inc., San Diego, CA. Fluid Systems Div.
C. E. Milstead, and R. L. Riley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153370, Price codes: A05 in paper copy, A01 in microfiche. January, 1981. 74 p, 17 Fig, 20 Tab. OWRT-C-00163-D(7529)(1), 14-34-0001-7529.

Descriptors: Composite membranes, *Reverse osmosis, Brackish water, *Desalination, *Spiral-wound elements, *Membrane processes, *Roswell, New Mexico, *Yuma, Arizona.

The objective of this three-phase program was to develop a high-salt rejection thin-film composite membrane for incorporation into 8- and 12-in. diam. x 40-in. wide spiral-wound elements suitable for replacement elements for the 75 MGD Yuma Desalting Plant. Four types of thin-film composite membranes, prepared by interfacial polycondensation techniques on a fabric-reinforced porous polysulfone support, were evaluated. The optimum membrane, a polyamide, designated TFC-402, was successfully produced in large quantities for spiral-wound element fabrication. This membrane, yielding 22-25 gal/ft2-day and greater than 99% TDS rejection from a Yuma Plant 70% recovery brine at 400 psi applied pressure, was fabricated into 2 1/2-, 4-, 8-, and 12-in. diam. x 40 in. wide elements for field testing at the OWRT Test Facility at Roswell, N.M. Testing of the 8- and 12-in. elements, prior to shipment to Roswell, in San Diego on a 4500 ppm TDS brackish well water feed showed that both element types gave about 99% rejections with high product fluxes.

DRAFT ENVIRONMENTAL ASSESSMENT DESALTING DEMONSTRATION PLANT, LAGUNA, NEW MEXICO.
MetaMetrics Inc., Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153735, Price codes: A05 in paper copy, A01 in microfiche. Technical Report submitted to Office of Water Research and Technology, March 31, 1981. 72 p, 8 Fig, 12 Tab, 98 Ref. OWRT-C-00255-D(0452)(2), 14-34-0001-0452.

Descriptors: *Desalination, *Environmental effects, Environmental impact statement, *Wastewater lagoons, Wastewater disposal, Desalination wastes, Ecological effects, Land use, Air pollution, Noise, Feasibility study, *Water supply development, *Laguna Pueblo, Indian Reservation, Laguna, *New Mexico, Canoncito.

The environmental consequences of the construction and operation of a desalting demonstration plant were assessed. A desalting demonstration plant using brackish well water could supply a Laguna community which had been proposed for the site and the nearby Canoncito Navajo Reservation with potable water. A well field located at the plant site would withdraw approximately 400,000 gallons per day to produce 300,000 gallons per day of potable water. Yields of individual wells were estimated to be 50 gpm and as many as six wells would be required. Transmission of water from the well field to the plant site would require 1,000 feet of pipeline. The major waste products which will result from the operation of the desalting plant are a high TDS brine and sludges. Evaporation ponds would dispose of the brine. A design was specified to prevent leakage from the ponds. Multi-cell, sludge drying beds were specified for disposal of sludge. The environmental effects and impacts of construction and start-up of the plant were assessed along with those of the proposed new community.

POST-TREATMENT PROCESS FOR REVERSE OSMOSIS MEMBRANES,
FilmTec Corp., Minneapolis, MN.
J. E. Cadotte, R. S. King, R. J. Majerles, C. Hultman, and R. J. Petersen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157975, Price codes: A03 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, January, 1981. 35 p, 2 Fig, 10 Tab, Append. OWRT-C-90090-S(9415)(1), 14-34-0001-9415.

Descriptors: *Colloids, *Sealants, *Desalination, *Reverse osmosis, *Membranes, Thin films.

Reverse osmosis membranes capable of producing potable water from seawater by single-pass desalination processes are difficult to make. Small defects in the thin film barrier layer are introduced during various stages of production of desalination devices. This report covers research on synthetic and natural organic colloidal preparations that seal membrane defects. Types of colloids synthesized and tested included: polyamine-aldehyde,melamine-aldehyde, and polyphenol-aldehyde condensation products; piperazine-epoxy adducts; sulfonated polysulfone; oxidized polyamines, and crosslinked polyacrylic acid. Tannic acid was also tested for comparison. Colloidal preparations with 0.1-0.2 micrometers in thin film composite membranes. Spiral-wound membrane elements with as low as 93 percent salt rejection were improved to single-pass desalination quality by treatment with selected colloids. Sequential treatment with a cationic colloid, then an anionic colloid, produced some dramatically increased salt rejections in spiral elements initially showing only 68-85 percent salt rejection.

MANAGEMENT OF BLOWING SNOW ON SAGEBRUSH RANGELANDS,
Rocky Mountain Forest and Range Experimental Station, Laramie, WY.
D. L. Sturges, and R. D. Tabler.
Journal of Soil and Water Conservation, Vol 36, No 5, p 287-292, September-October, 1981. 7 Fig, 3 Tab, 15 Ref.

Descriptors: *Snow management, *Range management, Water resources, Range grasses, Vegetation, Fences, Snow storage, Snowmelt, Snow accumulation, Water supply, Snow traps.

Snow management on rangelands can increase forage production, make more water available for livestock and irrigation, and improve wildlife habitat. A procedure for estimating the volume of blowing snow arriving at specific locations is especially important for successful snow management. Two equations are offered which make it possible to design successful snow management projects. Measured snow storage was in reasonable agreement with predicted transport at both a snow fence and snow harvest areas where these predictions were tested. At the Dodge Creek Ranch 54 cubic meters per meter (581 cubic feet/foot) of additional water stored by snow fencing represented 'new' water for the rancher, since most of it would otherwise have evaporated as it was transported across the watershed. At Boundary ridge, a snow harvest area was created by chopping sagebrush on the windward side of a ridge, providing 24 cubic meters per meter (258 cubic feet/foot) of additional water equivalent in the leeward drift. However, little water reached the stock water pond it was intended to recharge. This result underlines the importance of incorporating water collection and conveyance facilities into snow management projects. Water losses to evaporation, soil recharge, and deep seepage usually comprise a large percentage of water stored in large drifts. Increasing the roughness height of vegetation by planting crested wheatgrass in strips doubled on-site snow retention compared with that retained on untreated sagebrush rangeland. Increasing the retention of snow should increase soil water recharge and improve site productivity. (Baker-FRC)

3C. Use Of Water Of Impaired Quality

LEGAL, ECONOMIC AND INSTITUTIONAL BARRIERS TO WATER REUSE IN NORTHERN NEW ENGLAND, BOSTON, MASSACHUSETTS,
Bracken and Baram, Boston, MA.
M. S. Baram.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153388, Price codes: A08 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT/RU-81/6, September, 1980. 150 p, 2 Fig, 1 Tab. OWRT-C-90186-R(9424)(1), 14-34-0001-9424.

Descriptors: *Water reuse, *Legal aspects, *Institutional constraints, *Common law, *Public investment, *Effluent limitations, Water supply, Water conservation, Taxes, Economic aspects, Navigable waters, Groundwater, Surface water, Financing, Industrial water, Agriculture, Recycling, Water quality, *New England, Maine, New Hampshire, Massachusetts, Vermont.

Legal and institutional reforms at federal, state and local levels of government are needed to remove major obstructions to water reuse as a conservation strategy in northern New England. Legal

research and seven case studies on municipal, industrial, energy and agricultural users of water in Massachusetts, New Hampshire, Maine and Vermont reveal that the obstructions to water reuse call for immediate legal reforms in four areas: (1) availability of public funds under federal construction grant program for wastewater treatment; (2) use of environmental controls on current practices to force adoption of reuse technology; (3) modification of property rights in water doctrines of the common law; and (4) modification of water rates and rate structures now in use. Further, institutional reforms are needed. The networking of fragmented authorities is needed to promote coherent regional strategies for conservation and reuse. Thus, future water management in northern New England could begin to cope with growing water shortages by adopting conservation principles and reuse practices.

EFFECTS OF SCHEDULING MUNICIPAL WASTE-WATER EFFLUENT IRRIGATION OF REED CANARYGRASS ON NITROGEN RENOVATION AND GRASS PRODUCTION,
Minnesota Univ., St. Paul. Dept. of Soil Science.
D. R. Linden, C. E. Clapp, and J. R. Gilley.
Journal of Environmental Quality, Vol 10, No 4, p 507-510, October/December, 1981. 3 Fig, 2 Tab, 5 Ref.

Descriptors: *Wastewater irrigation, *Irrigation water, *Grasses, *Nitrogen removal, Wastewater disposal, Reed canarygrass, Soil water, Effluents, Water pollution effects, Fate of pollutants, Reclaimed water, *Impaired water use, Municipal wastewater.

Municipal wastewater applied to a 12 x 12 meter field of reed canarygrass (Phalaria arundinacea L.) produced yields of 10.2 and 15.0 metric tons per ha during 1975 and 1976, respectively. Effluent was obtained from the Apple Valley Wastewater Treatment Plant, Minneapolis-St. Paul, Minnesota, an activated sludge treatment facility serving a domestic suburban population. Soil was a Waukegan silt loam with a water table at 140 cm. The first year total application was 170 cm of effluent containing 320 kg per ha N, primarily as ammonium. The second year total application was 290 cm containing 530 kg per ha N. Varying the sprinkler irrigation schedules (1,2, or 5 irrigations per week) did not affect yields. Effluent contained 17-18 mg per liter N. Soil water concentrations averaged 1.0 and 2.4 mg per liter in 1975 and 1976, respectively. Crop uptake of N was abourt 80%. It is expected that the long-term soil water N levels would not increase much beyond the level measured in the second year. (Cassar-FRC)

VIRAL TRANSPORT TO GROUND WATER AT A WASTEWATER LAND APPLICATION SITE,
Texas Univ. at San Antonio.
B. E. Moore, B. P. Sagik, and C. A. Sorber.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1492-1502, October, 1981. 1 Fig, 9 Tab, 13 Ref.

Descriptors: *Water reuse, *Wastewater irrigation, *Path of pollutants, *Viruses, Water pollution sources, Fate of pollutants, Wastewater disposal, Irrigation water, Irrigation wells, Coliforms, Enteroviruses, Percolation, Bacteriophage, Texas.

The survival and transport of human enteric viruses through soil at an operating waste water irrigation site at Kerrville in South Central Texas were studied. Water sampling was carried out at three specially designed lysimeter sites and five monitoring wells. Bacterial and physical/chemical analyses as well as studies on the effects of more intensive irrigation were also carried out. In general, bacteria and coliphage densities were highest in the water collected at Lysimeter 1, which was closest to the irrigation pond. Although enteric virus isolations were made from each site, the most frequent recoveries occurred at Lysimeter 2 at an average depth of 1.37 m. Fecal coliforms and fecal streptococci were found with relatively high frequency at all monitoring wells, while no positive virus isolations from well water samples were made. Results of the intensive irrigation program showed that fecal coliforms and fecal streptococci were generally reduced by more than 90% in lysimeter waters within the 0.46 m depth. The isolation of enteroviruses in water from lysimeters, but not from monitoring wells, suggests that depth to ground water should be an important consideration in selecting irrigation sites. (Geiger-FRC)

REDUCING GROUND-WATER POLLUTION FROM MUNICIPAL WASTE-WATER IRRIGATION OF RHODES GRASS GROWN ON SAND DUNES,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel).
I. Vaisman, J. Shalhevet, T. Kipnis, and A. Feigin.
Journal of Environmental Quality, Vol 10, No 4, p 434-439, October/December, 1981. 9 Fig, 2 Tab, 9 Ref.

Descriptors: *Wastewater irrigation, *Irrigation water, *Nutrient removal, Nitrogen, Phosphorus, Fertilizers, Rhodes grass, Grasses, Water pollution control, Fate of pollutants, Wastewater treatment, Secondary wastewater treatment, Wastewater disposal, Impaired water use.

Application of secondary municipal effluent from settling ponds to sandy dune soil established with Rhodes grass (Chloris gayana Kunth) produced a high yield of animal feed without polluting groundwater with nitrate and P. The irrigation experiments were carried out during 1978 and 1979 in Israel. There were 4 treatments, 60, 80, 100, and 120% of Class A pan evaporation, using 5510, 6540, 8190, and 9580 cu m per ha of water, respectively. Fertilizers applied were either 0 or 700 kg N in 1978 and 250 or 500 kg N in 1979. Maximum yield of grass (12.2 Mg per has) was attained at the 80% irrigation treatment with 250 kg N fertilization. Higher quantities of water or fertilizer did not improve yields further. P in lysimeter drainage water did not exceed 0.5 mg per liter. Ammonium-N was not detected; nitrates were 0.5 mg per liter in drainage from the 250 kg-fertilized plot and 3-150 from the 500 kg fertilized plot. BOD was reduced from 53-72 mg per liter in the effluent to 3.2 mg per liter in the drainage water. Some salt leaching occurred, but winter rains removed most of the excess salts left in the soil after the irrigation season. (Cassar-FRC)

EFFECT OF SALINE IRRIGATION WATER ON THE YIELD OF POTATO,
Indian Agricultural Research Inst., New Delhi.
K. V. Paliwal, and B. R. Yadav.
Indian Journal of Agricultural Sciences, Vol 50, No 1, p 31-33, January, 1980. 1 Fig, 1 Tab, 3 Ref.

Descriptors: *Crop yields, *Irrigation practices, Salinity, Chemical properties, *Saline water, *Potatoes, *Impaired water use.

A study was conducted to determine the effect on yield, size, and number of potato tubers and the development of soil salinity in the root zone when saline water is used for irrigation. In both years of the study the yield of potato showed an abrupt, significant decrease with the application of saline water even of a salt concentration of 20 meq/liter. However, the significance of this reduction was not increased at 40 meq/liter concentrations. At a salinity of 80 meq/liter the yield was reduced by about 45% of that of the control. The effect of salinity on the total tuber number was significant at all salinity levels in the first year. In the second year, however, it was significant only at a salinity of 40 meq/liter and above. This minor variation was primarily due to the fact that canal water used as a control in the first year was of slightly better quality than the tubewell water used in the second year for control crops. Saline water irrigation significantly reduced the yield of tubers of all sizes, and reduced the sizes as well. In general the percentage reduction was due more to decrease in total yield and tuber size than in tuber number, particularly at the highest salinity level. (Baker-FRC)

COMMUNITY EVALUATION OF ADOPTED USES OF RECLAIMED WATER,
California Univ., Berkeley. School of Public Health.
W. H. Bruvold.
Water Resources Research, Vol 17, No 3, p 487-490, June, 1981. 3 Tab, 11 Ref. (California Water Resources Center Project UCAL-WRC-W-563).

Descriptors: *Water reuse, *Attitudes, *Reclaimed water, Surveys, Social aspects, Irrigation, Planning, Irvine, *California.

Irvine, California, currently uses reclaimed water for an ornamental lake, for golf course irrigation, for agricultural irrigation, for park and playground irrigation, and for common residential lawn irrigation. A survey of 140 residents determined that 75% were aware of the use of reclaimed water in the city, but about 50% were not familiar with details such as type of treatment, environmental changes, health risks, and costs. About 93% of the people had a favorable response to golf course, commons area, and park and school year irrigation; 88.6% for the ornamental lake; and 75.7% for food crop irrigation. Only 27.9% favored hypothetical use as drinking water. Recommendations for future local use were: add new uses, 24.3% in favor; expand existing uses, 5% in favor; maintain existing uses, 56.4%; and eliminate existing uses, 5%. Results were similar to those in a 1972 survey of attitudes toward possible future uses of reclaimed water in 10 California cities. (Cassar-FRC)

3D. Conservation In Domestic and Municipal Use

A FIELD EVALUATION OF SELECTED WATER CONSERVATION AND WASTEWATER REDUCTION SYSTEMS FOR RESIDENTIAL APPLICATIONS,
Wisconsin Univ.-Madison. Dept. of Civil and Environmental Engineering.
R. L. Siegrist, W. C. Boyle, and D. L. Anderson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153651, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Center, University of Wisconsin Technical Report WIS WRC 81-02, 1981. 119 p, 23 Fig, 67 Tab, 36 Ref, 4 Append. OWRT-B-105-WISC(1), 14-34-0001-1153.

Descriptors: Potable water, *Reclaimed water, Recycling, Wash water, Wastewater, *Wastewater irrigation, *Water conservation, Water treatment.

In-house water-using activities in residential dwellings throughout the United States contribute to a yearly per capita consumption of potable water that exceeds 18,000 gallons. Numerous strategies have been proposed for reducing domestic water demands and wastewater loadings. A demonstration study was performed at the University of Wisconsin-Madison to evaluate the performance of several technologies under field conditions. The technologies offer the potential for major reductions in residential water demands and wasteflows.

The project was accomplished in three distinct phases. Commercial low-flush toilet systems were studied in Phase I. Inhouse water use and wasteflow characteristics were measured on a daily and hourly basis and water use impacts of the low-flush systems were assessed. Single-home washwater recycle systems were investigated in Phase II. Inhouse water use and wasteflow were characterized and the water use impacts of the recycle systems were assessed. The final phase of the project investigated the reclamation of residential greywater (non-toilet water) by conventional onsite treatment processes—a septic tank—sand filter system. Characterization of the raw greywater flow and the effluent from the septic tank and intermittent sand filter was accomplished.

WATER CONSERVATION PROGRAM OF THE CITY OF GREENSBORO,
Greensboro Public Works Dept., NC. Water and Sewer Administration.
R. Shaw.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 64-67. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Water conservation, *Water supply, *Water use, Leakage, *Water loss, Conservation, Public opinion, Attitudes, Water treatment, Water purification, Water shortage, Plumbing, Public policy, Long-term planning, *Greensboro, North Carolina.

There are three major requirements in the 'Resolution of Assurance to Continue Water Conservation Program of the City of Greensboro,' adopted in 1979: that the water loss prevention program will continue to operate, that the City will continue to enforce the State Plumbing Code, and that the City will continue its Program of Water Conservation Education. Education has emphasized pamphlets on policies for new customers, and meter-reading. The continuous leak-control program is costly but reduces water loss. Leak detection is done in part using the Heath-Sonic kit, with the goal of detecting 150,000 to 200,000 gallons per day of leakage during the year. Water accountability is a major part of the program: the goal is to sell 85 percent of the available water, while achieving accurate and adequate metering of water leaving the treatment plant. Inaccuracies exist because of leakage, underregistration of small meters, unmetered flushing of hydrants to clear impurities, and water used in fire emergencies. Every service in Greensboro, totaling 50,000, is metered. A meter-maintenance plan replaces old meters to improve accountability. Additions to the State Plumbing Cod adopted by the City in 1954 now include provisions regarding the capacity of commodes and showerheads. A closed washwater-recycle system at the treatment plant saves pumping costs for 125 million gallons a year. (Garrison-Omniplan)

WATER SAVINGS IN THE ORANGE WATER AND SEWER AUTHORITY,
Orange Water and Sewer Authority, Carrboro, NC.
E. Billingsley.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 68-73. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Water conservation, Long-term planning, *Water supply, *Cost-sharing, Aquifers, Water deficit, Water use, Public policy, Economic aspects, Jurisdiction, Public opinion, Local governments, *Water metering, *Hillsborough, North Carolina.

To augment a marginal supply of water, the Orange Water and Sewer Authority (OWASA) developed the Cane Creek Reservoir, constructed a 10-mile tie line to connect with the Town of Hillsborough, and acquired an abandoned stone quarry to provide 200 million gallons of additional raw water storage. More importantly, structural and nonstructural conservation measures were instituted. Among the structural conservation measures were: storage of filter washwater and sedimentation basin wastewater at the Water Filter Plant and recycling the supernatant back to the head of the treatment process; emphasizing leak detection and repair to reduce losses; ensuring accurate and reliable metering; and requiring low-flow showerheads and water-saving toilets on new construction. Nonstructural conservation methods emphasized rates, consumer education, and awareness. A rate structure was adopted with a monthly service charge based on the size of the meter and a uniform commodity charge of $1 per thousand gallons used. Consumer education has been facilitated by use of the media, bill inserts, brochures, speakers' bureaus, plant tours, newsletters, information presentations on such topics as how to read a meter, and restaurant table cards explaining water conservation in the restaurant. Five progressively more stringent stages of mandatory conservation were enacted by city ordinance, with their use dependent on level of water supply. Constant community awareness of the current state of the water supply has also been considered important. As a result of all these measures, water demand is at the same level as it was five years ago, even with normal community growth. (Mantius-Omniplan)
W82-02519

LEAK DETECTION - TWO METHODS THAT WORK,
G. B. Cole.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance. 1980. p 78-83, 5 Ref. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Water loss, *Leakage, *Flow measurement, Federal jurisdiction, *Measuring instruments, *Sound waves, Economic aspects, Grants, Water metering, Water shortage, Flowmeters, Gages, Flow profiles, Water conservation, Pipelines, Water supply systems, Maintenance.

The major activity in reducing the amount of unaccounted-for water in utilities is the detection, location and repair of hidden underground leakage. This has been assigned a high priority by many utilities. Recognizing the need for developing and disseminating information on leak detection, AWWA formed a Leak Detection Committee to help educate operators across the U.S. In an effort to reduce costs, federal and state officials have also focused on this issue when reviewing requests for capital improvement funds for waste treatment facilities. Two approaches to reducing leakage are (1) listening and (2) a combination of flow measurements and listening, sometimes referred to as a 'water audit.' Listening involves the systematic use of sound-intensifying equipment to locate leaks. The sound waves can be picked up by sensitive instruments to help locate leaks with great accuracy. The water audit is a two-phase survey using flow measurements in the pitot tube flow meter, which can be attached to a photo recording device capable of recording continuous flow rates for 12, 24, or 48 hours. With a field accuracy of plus or minus 2%, this meter can measure flows over a wide range from a few thousand to over 200 million gallons per day. The advantage of just listening is that no excavations are needed to tap the mains; a disadvantage is its limited scope and inability to detect faulty metering. The water audit is comprehensive, and some gauging points must be excavated when necessary. (Garrison-Omniplan)
W82-02521

IN-HOME CONSERVATION AND WASTEWATER MANAGEMENT,
Battelle Pacific Northwest Labs., Richland, WA.
W. J. Hopp, and W. P. Darby.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 401-418, October, 1981. 6 Fig, 7 Tab, 18 Ref.

Descriptors: *Water conservation, *Wastewater management, *Cost-benefit analysis, *Domestic water, Maintenance costs, Construction costs, Operating costs, Grants, Mathematical models, Model studies, Wastewater treatment, Water consumption, Water management, Municipal water.

Household water conservation is a cost effective flow reduction measure to include in the overall strategy of a wastewater utility, according to results of a mathematical model. However, the Federal Construction Grants Program, which funds 75% of construction costs, but none of the costs of conservation devices, is a disincentive. As a result, the maximum cost per conservation device to achieve a 10% reduction in household water flow and still have a positive net present savings is $14.00, versus $46.00 without the grant program. It is suggested that 75% of the conservation device costs be funded to encourage conservation. This would be an important factor in marginal cases. The mathematical analysis uses a net present equivalent method and considers time value of money, inflation, population growth rate, public acceptance of household conservation practices, residential contribution to the treatment plant effluent, and wastewater facility costs (construction, operating, and maintenance). (Cassar-FRC)

Environmental Resources Center, Georgia Institute of Technology. Report ERC 04-81. June, 1981. 71 p, 20 Fig, 2 Tab, 65 Ref. OWRT-C-90303-C(9453)(1), 14-34-0001-9453.

Descriptors: *Water conservation, *Water reuse, Water consumption, Water use efficiency, Industrial water, Pulp, Paper, *Pulp and paper industry, Surveys, *Georgia.

This study contains an in-depth investigation of water usage patterns in 14 of the largest pulp and paper mills in Georgia responsible for nearly 85 percent of all production in the State. Consideration is given to water supply and water quality which the industry must address, and an identification is made of feasible conservation and reuse techniques the industry should consider. The report contains a tabulation of potential water withdrawal savings in Georgia, if mills practice both normal and potentially feasible conservation and reuse measures.

GEOTHERMALLY POWERED FOOD-PROCESSING SYSTEMS,
Food Engineering, Vol 53, No 10, p 97-100, October, 1981. 4 Fig, 1 Tab.

Descriptors: *Food processing industry, *Heated water, *Geothermal resources, Heating, Wells, Heat exchangers, Energy sources, Groundwater mining.

Geothermal energy can be applied to the food processing industry, according to studies on a hypothetical new corn wet milling plant in East Mesa, California, and an operating frozen food plant in Salisbury, Maryland. In the California plant a 6.6% energy savings could be attained using geothermal heat to preheat the waste gas stream before incineration, the air entering the starch dryer, and the makeup water entering the deaerator. A geothermal/cogeneration system, saving 17.1% energy, would use geothermal water to replace the waste heat used to generate electricity. In the frozen food plant, geothermal water at about 130 F would provide heat for process water by means of a heat exchanger and heat pumps.

Water would leave the heat exchanger at 110-140 F. Energy savings would be 52-80%, depending on the actual well temperature, and steam requirements would be reduced to 0-15% of present steam demands. (Cassar-FRC)

3F. Conservation In Agriculture

PUBLIC PERCEPTION OF GROUNDWATER DEPLETION IN SOUTHWESTERN KANSAS,

Kansas Water Resources Research Inst., Manhattan.
D. B. Kromm, and S. E. White.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153719, Price codes: A04 in paper copy, A01 in microfiche. Project Completion Report, 1981. 62 p, 4 Fig, 21 Tab, 42 Ref, Append. OWRT-A-097-KAN(1), 14-34-0001-0118.

Descriptors: *Attitudes, *Groundwater mining, *Irrigation practices, *Water management, Agriculture, Dry farming, Great Plains, *Kansas, Water policy, *Ogallala Aquifer, Perception of groundwater depletion, Water resource agencies.

Reports the awareness, response, and preferred adjustments of various socioeconomic groups with respect to groundwater depletion in southwest Kansas. Occupational differences account for greater variation in knowledge and response than do personal, locational, educational, length of residency, and other characteristics of regional residents. Farmers and those in agribusiness know more about state water law and the proportion of groundwater used to irrigate crops. However, they are significantly less concerned about groundwater depletion, have a much narrower range of regional concerns, and are more pessimistic about the economic future of southwestern Kansas. Most residents, with the exception of irrigators, have not yet had to significantly alter their behavior because of depletion. Respondents seemed especially concerned about future problems, however, and appear highly receptive to an active groundwater conservation program. Irrigators had more divergent preferences for various adjustments than any other socioeconomic group. Large-scale irrigators report significantly greater changes in water use practices than smaller operators and appear more receptive to new programs. Although measuring preferences for all groups reveals a wide range of acceptable adjustments to groundwater depletion, there is not a regional consensus on a viable management program or the governmental agencies that should have responsibility.

AERATED DRIP IRRIGATION,

Bonniville County Farm Bureau, Idaho Falls, ID.
W. Anderson.
In: Farm Bureau Energy Idea Symposium Proceedings, November 18-19, 1980, Des Plaines, Illinois. P 12-28. 10 Fig. (1980). American Farm Bureau Federation, Park Ridge, Illinois.

Descriptors: *Drip irrigation, Agricultural hydrology, *Irrigation, Water use, Crop yield, *Crop production, *Potatoes, Corn, Carrots, Farming, Water conservation, Sand filters, *Idaho.

An aerated drip irrigation system is described by a potato farmer in Idaho as having nearly doubled his potato yields and hastened their maturity. Even though the cost per acre of drip irrigation is higher than other methods in the potato industry, the cost per bag is lower and the net return is over four times as high. The system uses T-tapes involving quarter-mile-long-runs—far longer than the typical drip irrigation of 200-300 foot runs, and perhaps the longest in the world. The tape, which lies flat and can be driven over with tractors, runs on a 36-inch row, and costs approximately $350 per acre. Filters are filled with No. 20 blasting sand, and are used in pairs so that clean water coming through one will backflush and float all the debris out of that filter onto the ground or into a settling pond. Each filter will handle approximately 125-150 gallons per minute. The system saves 75 percent of energy costs and reduces water need for irrigation by 50 percent. Since the water is applied at the root zone, there is an estimated 30 percent reduction in fertilizer use. The pH of the water can be changed with sulphuric acid, phosphoric acid, or whatever acid the plant needs, and can be applied right in the root zone. The water pressure throughout the system is 8 PSI. In addition to potatoes, aerated drip irrigation was used on carrots and corn. Some of the carrots grew to two feet in length, and the yield of sweet corn on several acres was double, with twice as many ears as expected. Another farmer has been pleased with the yield from drip-irrigated raspberries. (Garrison-Omniplan)

SOLAR HEAT POND SYSTEM,

Howard County Farm Bureau, Nashville, AR.
B. Kreul.
In: Farm Bureau Energy Idea Symposium Proceedings, November 18-19, 1980, Des Plaines, Illinois. P 65-68. 1 Fig. (1980) American Farm Bureau Federation, Park Ridge, Illinois.

Descriptors: *Solar energy, Solar radiation, Energy, *Heated water, *Crop yield, Tomatoes, *Greenhouses, Heat, Farming, Cold resistance, Insulation, Heating, *Experimental design, Costs.

A prototype solar collector, in the process of being built for use at a greenhouse, has a 3,000-gallon reservoir for the heat storage mass and a corrugated aluminum collector plate. The system's total maximum heat collection during an average year is approximately 26 million Btus. Thus, while it cost $1,700 to construct, it will probably save $300-$600 per year in fuel costs. The capacity of the system could be doubled at a probable cost of $2,300. The water pit itself is earth-formed and double-lined with plastic and insulating material. The cover is operated by an electric winch that closes it at night. While the designers call it a 'solar pond' system, there is no salt layer as in typical solar ponds. Instead, there is a film of ultraviolet-resistant polyethylene over the pond to prevent thermal convection losses from the surface. The plans also call for a simple thermostatic system that shuts the system down when the water temperature cools down to a certain point, such as 60 degrees; at that point, the gas-fired system thermostats activate to provide heat. Pipes distribute the water from the reservoir to the collector plate surface, and the cool water is returned to the pond. Convection tubing distributes the warm air down the length of the greenhouse. The collector plate will be elevated out of the water and the water will circulate over it by means of a pump. The system was constructed from materials available at hardware stores. Other kinds of reflectors that could also work would be spherical or parabolic sections. (Garrison-Omniplan)

LOOP EQUATIONS WITH UNKNOWN PIPE CHARACTERISTICS,

IBM Scientific Center, Haifa (Israel).
E. Gofman, and M. Rodeh.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY9, p 1047-1060, September, 1981. 6 Fig, 7 Ref.

Descriptors: *Water distribution, *Irrigation operation, *Computer programs, Networks, Head generators, Loop equations, Pipes, Hydraulic engineering, Water pressure, Pressure head.

Water distribution networks, such as irrigation systems, may be easily analyzed with an interactive computer program using the concept of loop oriented hydraulic network solvers rather than node equations. The concept of head generators is introduced to describe the resistance in a pipe of unknown characteristics. A positive resistance might indicate that a regulating valve should be partially closed and a negative resistance may show the need for a booster. The method was extensively tested during 1978-80 in Israel and found useful for both design and operation of water distribution networks. Large networks with 300 pipes and 25 loops were efficiently solved on a portable computer. The program was easily used by engineers, students, and farm managers. (Cassar-FRC)

EFFECTS OF SALINIZATION TREATMENTS ON GROWTH AND SOME RELATED PHYSIOLOGICAL ACTIVITIES OF SOME LEGUMINOUS PLANTS,

Assiut Univ. (Egypt). Dept. of Botany.
A. M. Ahmed, M. M. Heikal, and M. A. Zidan.
Canadian Journal of Plant Science, Vol 60, No 2, p 713-720, April, 1980. 5 Tab, 29 Ref.

Descriptors: *Saline soils, *Crops, Sodium, Transpiration, Water supply, *Legumes, Vegetation, Farming, Salinity, Chemical properties, Soil properties, Soil types.

A study was conducted on the effect of various NaCl concentrations on plant-water relationships, mineral composition, pigment content, photosynthetic activity and dry matter production in legumes. When subjected to salinization levels of 20, 40 and 60 meq NaCl/liter the kidney bean cultivars Harvester and Contender and cowpea cultivars Asmarly and Creamy 7 exhibited significant changes in their physiological activities. The trends and magnitudes of these changes depended on the plant variety and on the level of salinization. In general, while stomatal frequency and transpiration rate were significantly reduced, water content was considerably elevated. Biosynthesis of pigments and photosynthetic activity and consequently leaf area and dry matter accumulation were considerably reduced as the concentration of NaCl in the nutrient medium increased. Mineral composition also exhibited significant changes, but the dominant feature was the high accumulation of sodium in salinized plant tissues. These cultivars should be regarded as saline sensitive and not as suitable for cultivation in saline soils. Water content in the different organs of each of the four treated cultivars was elevated with the rise in salinization level, except for Asmarly roots, in which it was reduced. This increase in water content was attributed to a decrease in the rate of transpiration. (Baker-FRC)

WATER FOR NEW ZEALAND'S PLAINS,

UOP Inc., Kirrawee (Australia). Johnson Div.
R. McCallum.
Johnson Driller's Journal, Vol 53, No 1, p 10, 1981.

Descriptors: *Irrigation wells, *Wells, *Irrigation engineering, *New Zealand, Water resources development.

Drilled wells in the prolific sand-gravel aquifers in New Zealand's Canterbury plains supply irrigation water for the extensive agricultural area. A typical recent installation consisted of a 12 inch well, 130 feet deep, developed with a solid surge block yielding 336 igpm. It was fitted with a 60 kw Pleuger electric submersible pump at 80 ft. A 6 inch PVC buried pipe supplies 6 hydrant take-off points. A 4-span Rotogator center pivot unit applies 3 inches per pass every 25-30 days. (Cassar-FRC)

A MANAGEMENT SYSTEM FOR THE CONJUNCTIVE USE OF RAINFALL AND LIMITED IRRIGATION OF GRADED FURROWS,
Science and Education Administration, Bushland, TX. Conservation and Production Research Lab.
B. A. Stewart, D. A. Dusek, and J. T. Musick.
Soil Science Society of America Journal, Vol 45, No 2, p 413-419, March/April, 1981. 3 Fig, 2 Tab, 9 Ref.

Descriptors: *Irrigation design, *Furrow irrigation, Irrigation efficiency, Irrigation operation, Furrows, Irrigation, Furrow drainage, Water use efficiency.

An effective management system was sought which would meet various requirements, such as permitting application of irrigation water without allowing water to leave the field; permit conjunctive use of rainfall by eliminating or minimizing runoff, even when rainfall closely follows irrigation; and permit efficient utilization of applied water for crop production. Under this plan a 600 meter field was divided into three water management sections. The upper half of the field was managed as fully irrigated. The next fourth was a tail-water-runoff section that used furrow from the fully irrigated section. The lower one-fourth section was designed as a dryland section, retaining and using any runoff, generated either by irrigation or by rainfall, from the water, fully irrigated or tailwater-runoff sections. Furrow dams were an important part of the system design. Seeding rates were reduced down the field from 6 kg/ha in the fully irrigated section to 3 kg/ha on the tailwater section, to 1.5 kg/ha on the dryland section. Nitrogen applications were similarly reduced. For 1979, a year with near average rainfall, the system successfully prevented runoff from both irrigation and rainfall. (Baker-FRC)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

HISTORICAL BACKGROUND AND OVERVIEW OF PLAN FOR RESTORING FRESHWATER INFLOW TO AN ESTUARY IN CONJUNCTION WITH URBAN DEVELOPMENT,
Larsen and Associates, Miami, FL.
P. Larsen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, October, 1981, p 201-211, 7 Fig, 3 Ref.

Descriptors: *Estuaries, *Wetlands, *Mangrove swamps, *Land development, Construction, Drainage effects, Laminar flow, Flow pattern, Flood control, Urbanization, *Florida.

Marco Island is located in a mangrove estuarine area on the southwest coast of Florida. When the project started in 1964, State and Federal regulations encouraged the development of waterfront communities in mangrove areas. Initial plans called for dredging and filling large portions of the 19,500 acre original ownership area. The Marco Island development proceeded concurrently with changing wetlands regulations, and eventually permits to develop 31% of the Marco Island plan were denied. The developer has proposed a substitute plan for development of 1,500 acres of uplands and 2,500 acres of wetlands located near the estuary. A key feature of the new plan is the proposed restoration of freshwater inflow to fringing estuarine wetlands impacted by prior construction of roads and drainage works. The proposed plan for restoring freshwater inputs to the estuary is based upon blocking all channelized flows that presently leave the site. Real estate lakes will be constructed in uplands and in impacted freshwater wetlands immediately upgradient. Freshwater outflow from the lakes will be delivered to the estuary via sheet flow across preservation wetlands. The lake system is designed to initially retain a 100-year, 24-hour storm. During dry periods groundwater inputs to the lake will be routed to spreader ditches and then to wetland surface flow instead of lost to drainage ditches. (Moore-SRC)

FRESHWATER INTRODUCTION INTO LOUISIANA COASTAL AREAS,
Army Engineer District, New Orleans, LA.
J. C. Weber, and R. A. Buisson, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81-04, Vol I, Oct. 1981. p 366-375, 3 Fig, 4 Ref.

Descriptors: *Wildlife conservation, *Salinity, *Estuaries, *Diversion structures, Planning, Coastal waters, Local governments, Benefits, Freshwater inflow, *Louisiana.

The conservation and enhancement of fish and wildlife resources through the control of salinities in portions of the estuarine area of Louisiana are the purposes of one authorized project and two ongoing studies in the U. S. Army Engineering District, New Orleans. The primary measure identified for controlling salinities is to divert water from the Mississippi River near the delta to adjacent estuarine areas. Planning and implementing this type of project presents a challenge from both technical and institutional standpoints. Technically, the state-of-the-art for quantifying benefits and impacts must rely on expert judgment and assumptions. From the institutional aspect, freshwater diversion is supported by many Federal, State, and local agencies and organizations. However, obtaining local cooperation and support for specific diversion sites may be the most difficult problem to solve because the local areas where diversion facilities would be located are not necessarily the areas receiving significant benefits from diversion. In some areas, benefits may not outweigh adverse impacts involved with constructing and operating diversion facilities. For the most part, benefits would be widespread and would accrue to interests not directly participating in the project.

ESTABLISHMENT OF CONTROLLED FRESHWATER DIVERSIONS OF THE MISSISSIPPI RIVER INTO THE LOUISIANA COASTAL ZONE,
Department of Natural Resources, Baton Rouge, LA.
M. E. Crandall, and J. L. Lindsey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Smyposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 139-146. 3 Fig, 6 Ref.

Descriptors: *Estuaries, *Erosion, *Wetlands, *Coastal zone management, Regulations, Diversions, Costs, Planning, Estuarine fisheries, Productivity, Resources management, Mississippi River, Louisiana.

Dredging of the channel and construction of levees along the Mississippi River, together with the absence of freshwater introduction at the upper ends of the hydrologic basins, have set up a positive feedback loop leading to increased land loss. Coastal wetland is being lost at a rate of 16.5 sq miles per year. This land loss is a cause of reduced productivity of area fisheries. There are two approaches to alleviate the problem: regulation, and programs to restore or mimic the natural processes of the system. Regulations have been developed, but their use can only retard the aggravation of the deterioration process. Freshwater diversions to restore natural conditions may be large or small scale. The small scale diversions are more practical because of their smaller cost and shorter-term planning. Both are likely to face problems of local funding difficulties, user conflicts, land user changes, and general distrust of projected results. A combined local, state and federal effort is necessary for the positive effects of freshwater diversions into Louisiana's estuarine system can become a reality. (Brambley-SRC)

THE MOUTH OF THE COLORADO RIVER PROJECT; AN ECONOMIC DEVELOPMENT ENVIRONMENTAL ENHANCEMENT PROJECT,
Army Engineer District, Galveston, TX. Engineering Div.
J. C. Trahan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 166-178. 2 Fig, 5 Ref.

Descriptors: *Colorado River, *Texas, *Estuaries, *Navigation, *Channel improvement, *Diversion channels, Dams, Planning, Economic evaluation, Fisheries, Deltas, Marshes, Land development, Water management.

The Mouth of the Colorado River (Texas) Project was originally intended to be only a navigation project but was expanded to include a diversion project. The Project will provide a jettied entrance channel in the Gulf of Mexico at the mouth of the river; a navigation channel to Matagorda; a diversion channel and dam to divert the flow of the river into Matagorda Bay; and related improvements. A history of project planning is presented to illustrate both interagency conflicts over data needs and proper reporting procedures and interagency cooperation on the studies finally conducted. The studies, which include an economic evaluation of the benefits of river diversion and a delta growth projection based on an in situ sediment study, mathematical modeling, a bay-bottom coring program, and a hydrographic survey are described, and the results of the study are presented. Because the studies show that a river delta of valuable intertidal marsh habitat would form and that additional freshwater inflow would significantly enhance the fishery, construction of the river diversion project is recommended. The project described illustrates the conflicting needs involved in freshwater inflow decisions and the complex data requirements of the decision process, and emphasizes that, because definitive scientific answers to inflow issues are often unavailable, a cooperative attitude among the affected parties is essential if results are to be achieved. (Brambley-SRC)
W82-02148

LOSS OF COLORADO RIVER INFLOWS TO MATAGORDA BAY, TEXAS, AND EFFORTS FOR RESTORATION,
W. J. Sheffield, and M. T. Walton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 216-229. 1 Fig, 2 Tab, 37 Ref.

Descriptors: *Diversion channels, *Colorado River, *Texas, *Environmental effects, *Shellfish, *Estuarine environment, Cost-benefit analysis, Planning, Navigation, Estuarine fisheries, Channelization.

Major disturbances to the Matagorda Bay system have included diversion of the Colorado River to the Gulf of Mexico and loss of supporting marshes. Supporting marshes have been reduced from

18,623 ha (46,000 acres) to 15,789 ha (39,000 acres) and oyster reefs have been reduced in area from 11,660 ha (28,800 acres) in the late 1800's to 8,291 ha (20,480 acres) at present with only one-fourth of this area consistently productive. Oyster production has decreased because parasitic infestations have increased in response to increases in salinity. Production of shellfish in West Matagorda Bay is estimated to be only 20% of that possible through utilization of environmental management. Methodologies for calculating potential changes in shellfish production due to rediversion of the Colorado River are presented. Annual economic benefits for increased shellfish production in West Matagorda Bay and Gulf of Mexico attributable to rediversion are estimated to be in excess of $17.1 million. Significant actions relating to the Mouth of Colorado River Texas Project, sanctioned by Section 101 of the Rivers and Harbor Act of 1968, include separation of project features by the Crops of Engineers, restoration of the diversion feature to the project, and delay in navigation feature construction due to threats of legal action. A project to link East Matagorda Bay to the Colorado River Channel is suggested, to provide permanent access from East Matagorda Bay to the Gulf of Mexico. (Brambley-SRC)

SANTEE-COOPER REDIVERSION: PROJECTED IMPACTS ON FISHERY RESOURCES AND WILDLIFE HABITATS,

Fish and Wildlife Service, Cookierville, TN.
L. A. Barclay, Jr., and V. G. Burrell, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 463-473. 1 Fig, 20 Ref.

Descriptors: *Environmental effects, *Partial diversion, *Santee River, South Carolina, *Sediment control, *Fisheries, *Wildlife habitats, Oysters, Clams, Shrimp, Salt marshes, Brackish water, Population dynamics.

The fresh water from the Santee River drainage basin was diverted through the Santee-Cooper hydroelectric plant into the Cooper River in 1942. This increased the average flow in the Cooper River from 72 cfs to 15,600 cfs, and concomitant sediment resulted in a tremendous increase in shoaling in Charleston Harbor. The U.S. Army Corps of Engineers has initiated a project to alleviate this shoaling problem by rediverting most of this fresh water back into the Santee channel and reducing the average weekly flow in the Cooper River to approximately 3,000 cfs. This rediversion is scheduled to be completed in 1982. It is projected that fish and wildlife resources will be subjected to substantial impacts as a result of rediversion. Highly productive oyster and clam beds will be displaced or destroyed, as will valuable shrimp and finfish nursery areas. Severe reduction of freshwater flows into the Cooper River drainage will result in the displacement of freshwater and brackish marsh vegetation by saltmarsh plants; conversely, increases in freshwater flows into the Santee River drainage will cause salt marsh and brackish marsh vegetation to be succeeded by freshwater plants. These vegetative changes will cause profound changes in the wildlife populations of these two river drainages.

BIOLOGICAL CONTROL OF AQUATIC WEEDS IN SOUTHWEST FLORIDA,

Lee County Hyacinth Control District, Fort Myers, FL.
J. R. Cassani, and T. Y. Miller, Jr.
Journal of Aquatic Plant Management, Vol 19, p 49-50, July, 1981. 1 Fig, 6 Ref.

Descriptors: *Aquatic weed control, Weed control, *Florida, Water hyacinth, Alligatorweed, Aquatic plants, Insects, Arthropods, Fish, Herbicides, Plant diseases, Carp.

The biological aquatic weed control program in the Lee County Hyacinth Control District is described. Three major types of biotic agents being used or investigated are phytophagous arthropods, herbivorous fish, and pathogens. Water hyacinth weevil (Neochetina eichhornia Warner) and a related species were released in 1974, but only the former is distributed and destroying weeds extensively. Sameodes albiguttalis Warner has produced a severe infestation on water hyacinth in the Manatee River. Alligatorweed flea beetle (Agasicles hydrophila) populations are highest in December-April, and dormant in hot weather. At least 16 sites in southwest Florida have been stocked with grass carp or with a hybrid fish (female grass carp and male hybrid bighead carp). These are monitored quarterly and have been found partially successful. Limited research on bacterial and fungal pathogens is underway. (Cassar-FRC)
W82-02285

CONTROL OF AQUATIC WEEDS WITH HEXAZINONE,

Science and Education Administration, Davis, CA.
L. W. J. Anderson.
Journal of Aquatic Plant Management, Vol 19, p 9-14, July, 1981. 7 Fig, 1 Tab, 18 Ref.

Descriptors: *Aquatic weed control, *Herbicides, *Hexazinone, Weed control, Toxicity, Ponds, Algae, Phytoplankton, Macroinvertebrates, Invertebrates, Fate of pollutants, Water quality, Species diversity, Aquatic plants, Water pollution effects.

In an aquatic weed control trial, 0.97 kg of the herbicide hexazinone was applied to a 0.08 ha pond to produce a 1 ppm concentration in water. The following weeds were completely controlled: American pondweed (Potamogeton nodosus Poir.), Sage pondweed (P. pectinatus L.), elodea (Elodea canadensis Michx.), cattail (Typha sp.), Spirogyra sp, slender spikerush (Eleocharis ocicularis L.), and Chara sp. Root to shoot translocation was observed in cattails and Russian olive trees. Decaying vegetation caused a drop in dissolved oxygen from 8 ppm to 0.2 ppm within 5 days after treatment, causing a fish kill. Oxygen levels remained at 1-4 ppm during the remainder of the 4-month study. Decomposing plant tissue also released P and N compounds into the water. The species diversity index of periphyton fell to a low of 0.2 by 98 days post treatment (control pont, 1.5-2.0) and recovered to 0.5 by 119 days. The species diversity index of macroinvertebrates deteriorated to 0.4 by the 52nd day and recovered to 1.3-1.5 by the end of the study. The control pond index was 1.5-2.5. Observations 1 year after herbicide application indicated no regrowth of plants except for phytoplankton and benthic algae. A bioassay showed no residual phytotoxicity in water or sediment. (Cassar-FRC)
W82-02326

DIQUAT AND SODIUM ALGINATE FOR WEED CONTROL IN RIVERS,

Agricultural Research Council, Oxford (England). Weed Research Organization.
P. R. F. Barrett.
Journal of Aquatic Plant Management, Vol 19, p 51-52, July, 1981.

Descriptors: *Herbicides, *Aquatic weed control, *Diquat, Weed control, Rivers, Aquatic plants, *Eden River, *England, Sodium alginate, Gels, Invertebrates, Benthic fauna, Water quality.

Diquat in a sodium alginate carrier allowed local control of aquatic weeds in the River Eden, Cumbria, England, with little apparent adverse effect on the invertebrate fauna. Experiments were conducted during low water (discharge 7 cu m per sec) in June of 1977 and 1978. A viscous solution of 100 g diquat cation in 1 liter sodium alginate solution (30 g per liter) completely destroyed weed beds (largely Ranunculus fluitans Lam. and Ranunculus penicillatus Butcher C D K Cook) and created clear channels up to 40 min or 120 min. The other treatments were: 100 g diquat in 5 liters water (no carrier) and 100 g diquat-sodium alginate diluted with river water to 5 or 10 liters. Of these, only the diluted diquat-alginate applied over the 120 min period produced nearly complete weed removal. Very few or no weeds were killed by the other procedures. It is likely that the alginate method will be acceptable in regions where high water quality is a concern. (Cassar-FRC)
W82-02328

PRELIMINARY EVALUATION OF HYDROGEN PEROXIDE AS A POTENTIAL HERBICIDE FOR AQUATIC WEEDS,

Science and Education Administration, Stoneville, MS. Southern Weed Science Lab.
P. C. Quimby, Jr.
Journal of Aquatic Plant Management, Vol 19, p 53-55, July, 1981. 1 Tab, 11 Ref.

Descriptors: *Hydrogen peroxide, *Aquatic weed control, *Herbicides, Weed control, Aquatic plants, Alligatorweed, Water hyacinth, Coontail, Hydrilla, Toxicity, Fish.

Hydrogen peroxide proved effective as a herbicide for aquatic weeds. Coontail and hydrilla were exposed in the laboratory to 1, 2, 3, and 4 nM of H2O2 for 1, 30, and 60 min and 5 days. Acceptable weed suppression (90-100%) was seen at 1 nM for the 5-day exposure. Guppies in the water were not injured during this test. Other treatments which were > 80% effective were the 60 min exposure to the 3 and 4 nM concentrations. A 1 min exposure at the highest peroxide concentration produced 0-20% suppression, and a 30 min exposure, 70-80%. No effects on emersed alligatorweed or floating water hyacinth were seen at the concentrations used in this study, showing its selectivity toward submerged weeds. (Cassar-FRC)

GROWTH AND PHOTOSYNTHESIS OF NAJAS MARINA L. AS AFFECTED BY LIGHT INTENSITY,

Tel Aviv Univ. (Israel). Dept. of Botany.
M. Agami, S. Beer, and Y. Waisel.
Aquatic Biology, Vol 9, No 3, p 285-289, 1980. 3 Fig, 6 Ref.

Descriptors: *Aquatic plants, *Plant growth, *Photosynthesis, *Light intensity, *Najas marina, Reservoirs, Light penetration, Water pollution control, Water levels, Water supply, Aquatic weed control, *Israel.

Marked reduction in growth of Najas marina was observed in slightly increased water depths, suggesting that short periods of water level alteration could control this nuisance plant in reservoirs without the use of polluting chemicals. Najas plants grew uniformly in the upper 50 cm of water and increased their net weight to a lesser degree between 50 and 100 cm depth. At depths of 200-250 cm the plants grew for the first week (probably from stored carbohydrate reserves), kept the same weight for the second week, and deteriorated during the third week. Studies were conducted in August, the optimum growth season of the plant. Light intensities were 360 micro-units per sq m-sec at 50 cm depth, 60 micro-units at 100 cm, and below the compensation point, 1.5 micro-units, at 200-250 cm. Light saturation was reached at 280 micro-units per sq m-sec, and the light compensation point for net photosynthesis was 5 miccro-units per sq m-sec (depth of 170 cm). Najas growth may be affected by the month of the growing season, changes in water level or turbidity, or algal blooms. (Cassar-FRC)

METHODS OF RESTORING THE DELIVERY OF DRAINAGE WELLS,

V. S. Alekseev, and V. T. Grebennikov.
Hydrotechnical Construction, No 1, p 24-28, January, 1980. 2 Fig, 1 Tab, 4 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 15-17, January, 1980.

Descriptors: *Drainage systems, *Flood control, Flood protection, Permeability, Maintenance, *Drainage wells, Wells.

Field studies were conducted to determine the effectiveness of different methods of restoring the yield of drainage wells. The drainage system examined is a linear row of wells with a total length of 7.9 km located parallel to and at a distance of 150 meters from a protective dike. The distance between wells is 12-25 m. The wells drain the pressure-free aquifer of ancient alluvial deposits both above and in the Volga River terrace. The permeability of the stratum increases from 5-20 m/day in the south to 60-80 m/day in the north. The waters contain calcium hydrocarbonates, with a mineral content of up to 900 mg/liter. The pH varies from 7.3 to 8.2, and the total iron concentration reached 30 mg/cu dm. During the operation of a drainage system, the reduction in well productivity is governed by chemical silting processes, the rate of which is determined by the design of the permeable portion of the well. Use of the pneumatic-impulse treatment of wells with an interrepair period of not more than 6 months is possible in wells that have been in service not longer than 3-4 years. Wells in service for 5-10 years can be treated by detonation of a blasting fuse to restore 45-65% of initial yield. Solution of silting formation for a 6-7 year old well is ensured by concentrated hydrochloric acid and powdered reagents. Interrepair periods for this treatment method range from 18-24 months. Combined treatment methods are expedient in wells in service for more than 7-8 years where interrepair periods of 24-30 months have been observed. Experience acquired with massive restoration of drainage productivity in wells in this flood-control system can be used to develop measures which will stabilize the effect of verticle drainage of terrace dams and flood-protection systems under similar hydrogeologic conditions. REASSESSMENT OF THE EFFECTS OF CONSTRUCTION DEWATERING ON GROUNDWATER LEVELS IN THE COWLES UNIT, INDIANA DUNES NATIONAL LAKESHORE, INDIANA. SUPPLEMENT TO GEOLOGICAL SURVEY WATER-RESOURCES INVESTIGATIONS 78-138,

Geological Survey, Indianapolis, IN. Water Resources Div.
D. C. Gillies, and W. W. Lapham.
Available from the OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, Prices: $7.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-1105, September, 1980. 50 p, 23 Fig, 3 Tab, 4 Ref.

Descriptors: *Settling basins, *Ponds, *Fly ash, *Seepage, Water level, *Dewatering, Groundwater, Groundwater movement, Aquifers, Construction, Model studies, Hydrogen, Surface-groundwater relations, *Indiana, Indiana Dunes National Lakeshore.

A revised dewatering plan for the construction of a nuclear power plant at the Northern Indiana Public Service Company's (NIPSCO) Bailly Generating Station and evidence that suggests that a change in the characteristics of the confining unit 2 in and near Cowles Bog National Landmark may exist have resulted in a reassessment of the effects of construction dewatering on ground-water levels in the Indiana Dunes National Lakeshore. Model results indicate that the revision in the dewatering plan produces water-level declines that do not differ significantly from those described previously. However, when the change in the confining unit beneath Cowles Bog is considered, simulations of the simultaneous decline of a seepage mound after sealing of the fly-ash-ponds and the second phase of construction dewatering indicate that the simulated water-level declines in the aquifer unit 1 at Cowles Bog may be below the water levels tolerated by the National Park Service after 18 months. The water levels may even decline below the tolerable levels in spite of NIPSCO's proposed plan of artificially recharging the aquifer unit 1 near the excavation site at 400 gal/min. The magnitude of the simulated water-level declines in unit 1 within the Lakeshore, caused by pumping from the excavation, depends on the relation in time between the second phase of dewatering and the decline of the seepage mound after sealing of the fly-ash-ponds, but not on the duration of dewatering beyond 18 months. WETLANDS USE FOR WATER MANAGEMENT IN FLORIDA,

Corvallis Environmental Research Lab., Cincinnati, OH.
D. C. Ammon, W. C. Huber, and J. P. Heaney.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 315-327, October, 1981. 1 Fig, 1 Tab, 8 Ref.

Descriptors: *Wetlands, *Water management, *Runoff, *Florida, *Kissimmee River Basin, Lake Okeechobee, Flood control, Marshes, Swamps, River basins, Drainage, Phosphorus, Water quality, Water resources, Weirs, Water supply, Nutrient removal, Outlets, Runoff, Detention dams.

A basin-wide water management scheme has been proposed for the Kissimmee River basin, Florida. This 2300 sq mi area contributes a major portion of surface inflow and nutrient loads to Lake Okeechobee, which is the primary water resource for southern Florida (irrigation water, maintenance of Everglades National Park, aquifer recharge, municipal supply, recreation, wildlife habitat, and flood control). By 1972 the basin hydrology had been altered by a 53 mile channel so that rapid runoff was characteristic. The management plan is based on detention of runoff, restrictions of surface water discharge rates, and routing flow through marshes. A representative wetland, Chandler Slough Marsh (1000 acres) was chosen as the study area. Simulation analyses showed it to be moderately effective as a quality and quantity control unit. Detaining surface runoff would increase detention time and produce a larger proportion of subsurface pathways, reducing inflow peaks and nutrient concentrations to the downstream marsh. Construction of a weir system would produce greater nutrient removal from the water but more frequent inundation of surrounding areas. In addition, it would bar the periodic flushing of nutrients and dead vegetation that prevents nutrient buildup. (Cassar-FRC)

LARM TWO-DIMENSIONAL MODEL: AN EVALUATION,

Tennessee Technological Univ., Cookeville.
J. A. Gordon.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 877-886, October, 1981. 5 Fig, 1 Tab, 10 Ref.

Descriptors: *Reservoir management, *Water temperature, *Flow patterns, Water management, Model studies, LARM model, *Center Hill Lake, *Tennessee, Lakes, Temperature, Water quality, Dissolved oxygen, Oxygen, Hydrodynamics, Stratification, Weirs, Simulation analysis, Flow control, Flow velocity, Outlets.

A laterally averaged reservoir model (LARM) was used to investigate the flow regimes of Center Hill Lake, Tennessee, during the dry year 1972 and the wet year 1973. This numerical, two-dimensional model combines the mass continuity, momentum, and energy equations and computes temperature and flow velocity vectors resulting from raised or multilevel power outlets. Predicted outflow temperatures for 9 dates (April to September) were very close to measured temperatures. The model realistically handled periods of isothermal to spring stratification, fall overturn, and flood conditions. Outflows, inflows, and reverse flows were all depicted by the model. Different outlet levels were simulated to predict effects on hydraulic residence time and dissolved oxygen levels. Using a raised outlet kept the hypolimnion cooler, discharge waters about 5C warmer, and inflow patterns the same as the normal level outlet. Hydraulic retention time in the metalimnion was 98 days with the raised outlet and > 155 days with the normal outlet. Simulation of a submerged weir from the bottom to 12 meters below the surface showed temperature discontinuities much smaller than expected. (Cassar-FRC)

INDUCED SINKHOLES: AN ENGINEERING PROBLEM,

Geological Survey, Tuscaloosa, AL. Water Resources Div.
J. G. Newton.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 107, No IR2, p 175-185, June, 1981. 3 Fig, 13 Ref.

Descriptors: *Sinks, *Carbonate rocks, *Geohydrology, *Water table profiles, *Drawdown, Engineering, Project planning, Groundwater, Geologic joints, Geologic fractures, Faults, Fissures, Geologic formations, Bedrock, Pumpage.

Conditions under which man-made sinkholes develop are described. Induced sinkholes are divided into two types: those resulting from a decline in the water table due to groundwater withdrawls and those resulting from construction. Most induced sinkholes occur where cavities develop in residual or other unconsolidated deposits overlying openings in carbonate rocks. Thd downward migration of the deposits into underlying openings in bedrock and the formation and collapse of resulting cavities are caused by a decline in the water table resulting in induced recharge and other changes in groundwater movement. Most sinkholes from construction are related to the diversion of drainage over openings in bedrock. (Titus-FRC)

MANAGEMENT OF INTERSTATE AQUIFER SYSTEMS,
Camp Dresser and McKee, Inc., Walnut Creek, CA. Water Resources Div.
H. O. Banks.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 563-577, October, 1981. 2 Fig, 10 Ref.

Descriptors: *Groundwater management, *Water law, *Aquifers, *Aquifer management, *Interstate compacts, Water resources development, Water supply development, Water management, Legal aspects, Economic aspects, International agreements, Management planning, Local governments.

The management of interstate aquifers, specifically, the Ogallala Aquifer and the Rio Grande Valley is examined. Regional models that could be expanded to include comprehensive groundwater resources management include federal interstate compacts, interstate compacts, river basin commissions, regional federal agencies, and regional federal-state commissions. Local gencies formed under statutory authority in Colorado, Kansas, Texas and Nebraska have taken limited interstate management actions for the Ogallala Aquifer. The management of groundwater resources by smaller districts is often hampered by limited financial resources. There is little public support for interstate management programs. The Six-State High Plains-Ogallala Aquifer Regional Resources Study was begun to improve the water supply situation of the areas served by the Ogallala Aquifer. The use and allocation of surface waters of the Rio Grande below Elephant Butte are governed by a treaty with Mexico, court decisions, interstate compacts and the water sales contract under the Rio Grande Project. Nine factors relevant to the development of an interstate management program are discussed. The legal and institutional factors that must be considered in formulating a groundwater resource management structure are influenced by social, environmental, and economic goals. A management program formulated and implemented under a regional water resource management commission is recommended to handle the specific aquifer interests of the states involved. (Geiger-FRC)

4C. Effects On Water Of Man's Non-Water Activities

FLOW REGIME AND SEDIMENT LOAD AFFECTED BY ALTERATIONS OF THE MISSISSIPPI RIVER,
J. R. Tuttle, and A. J. Combe, III.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, Oct. 1981. p 334-348, 8 Fig, 6 Ref.

Descriptors: *Sediment load, *Flow discharge, *Channel improvement, *Navigation, *Estuaries, Flood flow, Diversion losses, Sediment transport, Overland flow, *Mississippi River.

Alterations of the Mississippi and Atchafalaya Rivers over the past 140 years have significantly affected the distribution of flow and sediment loads entering the estuaries of south Louisiana. The most significant alterations were: removal of the Atchafalaya River log raft and subsequent alterations which hastened natural processes; confinement of flood flows by levees limiting discharges to three specific outlets; and those alterations that caused a 50% reduction in average annual suspended sediment loads transported by the Mississippi and Atchafalaya Rivers. The average volume of flow delivered annually to south Louisiana has not been affected by alterations. The average annual volume of water transported by the Mississippi below the latitude of Red River Landing has decreased due to increased diversions to the Atchafalaya River since the middle 1800's. Developments in the Atchafalaya Basin, following actions of the State of Louisiana to establish navigation in the middle 1800's, have significantly hastened the natural enlargement processes in the Atchafalaya Basin and Atchafalaya Bay. Channel enlargements in the middle and lower reaches of the Atchafalaya Basin have been instrumental in channeling sediments to the Atchafalaya Bay, reducing the potential for overbank sedimentation in the acceleration of a significant marsh area in Atchafalaya Bay. BIOLOGICAL CONSIDERATIONS RELATED TO FRESHWATER INTRODUCTION IN COASTAL LOUISIANA,
Army Engineer District, New Orleans, LA.
D. L. Chew, and F. J. Cali.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of biological Services Rept FWS/OBS-81/04, Vol I, Oct. 1981. p 376-386, 1 Fig, 2 Tab, 19 Ref.

Descriptors: *Estuarine environment, *Salinity, *Wetlands, *Wildlife, *Saline water intrusion, Environmental effects, Floods, Sediments, Nutrients, Fish, Shellfish, Marshes, Salt marshes, Coastal marshes, *Louisiana.

Louisiana has experienced a rapid loss of coastal wetlands due to natural processes such as subsidence and erosion, as well as man's engineering activities including leveeing, channelization and petroleum exploration. These activities have led to a reduction in overbank flooding and natural distributary flow which historically provided fresh water, sediments and nutrients to estuarine areas. In addition, construction of large navigation channels has caused progressive intrusion of saline waters. This has resulted in conversion of fresh, intermediate and brackish marshes to intermediate, brackish and saline marshes, respectively, as well as loss of some areas of wooded swamp. Saltwater intrusion and loss of wetlands have adversely affected productivity of wildlife and fishery resources and have led to declines in populations of waterfowl, furbearers and important shellfish and finfish species. Influx of saline waters is particularly harmful to the American oyster, due to increased predation. Juvenile stages of shrimp, menhaden and blue crabs are estuarine-dependent and utilize near-shore estuaries and adjacent wetlands as nursery areas. One way to ameliorate loss of wetland nursery areas and rate of saltwater intrusion is timely introduction of fresh water to provide sediments and nutrients vital to coastal wetlands. Major constraints to freshwater introduction in Louisiana are poor water quality and lower temperatures in the Mississippi River as compared to adjacent estuaries.

EFFECTS OF WETLAND CHANGES ON THE FISH AND WILDLIFE RESOURCES OF COASTAL LOUISIANA,
Fish and Wildlife Service, Lafayette, LA.
D. W. Fruge.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, Oct. 1981. p 387-398, 1 Fig, 44 Ref.

Descriptors: *Wetlands, *Habitats, *Wildlife, *Diversion, *Estuarine environment, Environmental effects, Sediments, Coastal marshes, Shellfish, Fish, Economic aspects, Estuarine fisheries, *Louisiana.

The vast wetlands of the Louisiana Coastal Region (LCR) are of national importance to fish and wildlife. Prior studies documented an annual land-loss rate of over 16.5 sq mi/yr in the LCR. More recent investigations indicate that this rate of wetland loss more than doubled since 1956. Wetland deterioration, which is partially attributable to natural causes, has been greatly accelerated by human influences such as navigation channel excavation, agricultural drainage, and construction of mainline Mississippi River levees that have prevented freshwater and sediment overflow into adjacent subdelta marshes. Continued wetland deterioration may lead to serious declines in estuarine-dependent fish and shellfish harvest, fur catch, waterfowl habitat, and related fish and wildlife productivity. Preliminary estimates indicate that the monetary value of fish and wildlife productivity can be increased by more than $4.5 million/yr with a single large-scale freshwater diversion structure that would introduce Mississippi River water into the Lake Pontchartrain-Lake Borgne Basin of southeast Louisiana. Because federally financed public works projects have played a major role in wetland deterioration in the LCR, mitigation of these losses through the federal public works program would seem appropriate. (Moore-SRC)

A NEW APPROACH TO DETERMINING THE QUANTITATIVE RELATIONSHIP BETWEEN FISHERY PRODUCTION AND THE FLOW OF FRESH WATER TO ESTUARIES,
National Marine Fisheries Service, Miami, FL. Southeast Fisheries Center.
J. A. Browder, and D. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office, of Biological Services Rept FWS/OBS-81/04, Vol I, Oct. 1981. p 403-430, 2 Fig, 85 Ref.

Descriptors: *Estuaries, *Estuarine fisheries, *Sediment transport, *Detritus, *Nutrients, Environmental effects, Model studies, Salinity, Estuarine environment, River flow, Mixing, Wetlands, Fish, Invertebrates, Microorganisms, Freshwater inflow.

Freshwater inputs to estuaries appear to enhance the production of marine organisms, because the highest standing stocks along shorelines are found in or near estuaries, which receive freshwater inputs. Activities of man that affect the quantity or timing of the flow of fresh water to estuaries include: dams for irrigation and power; diversions; canals in uplands; deforestation; clearcutting; grazing; road construction; and paving. The flow of fresh water into estuaries may influence fishery production, either directly or indirectly, in at least five ways: transport of nutrients; transport of detritus; transport and deposition of sediments; reduction of salinity; and mixing and transport of water masses. Diverse estuarine systems found along the gulf coast from Florida to Texas have similar problems as a result of changes in the quantity and seasonal patterns of the freshwater flow they receive. In a conceptual model, direct river inputs are sediments, nutrients, and fresh water. Sediments build and maintain tidal wetlands, counteracting both natural and anthropogenic processes that destroy wetlands. Nutrients in river water stimulate productivity of wetland vegetation. The physical force of runoff flushes decaying vegetation into tidal creeks and open waters, where it is processed by microorganisms into food for benthic animals, which are fed on by juvenile fish and invertebrates. Nutrients released to open water stimulate productivity of phytoplankton and seagrasses. Freshwater inputs establish chemical potential energy that sometimes drives the mixing of the estuary. (Moore-SRC)

EFFECTS OF FRESHWATER FLOW ON FISHERY RESOURCES IN THE SACRAMENTO-SAN JOAQUIN ESTUARY,
California State Dept. of Fish and Game, Stockton.
P. L. Herrgesell, D. W. Kohlhorst, L. W. Miller, and D. E. Stevens.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434,

Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX. Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct.1981, p 71-87. 6 Fig, 1 Tab, 19 Ref.

Descriptors: *River flow, *Fish populations, *Estuaries, *Low flow, *Environmental effects, Water level, Diversion losses, Growth stages, Saline water intrusion, Aquatic habitats, Freshwater inflow, *Sacramento-San Joaquin estuary, California.

The freshwater flows into the Sacramento-San Joaquin Estuary have been declining for many years and are likely to continue to do so. This decline, with the annual variations in flow, affects the fishery resources of the estuary. Diversions from the San Joaquin River are directly responsible for the loss of millions of fish, and are indirectly responsible for the loss of many more because of the effects of flow reversal on fish behavior, and because of the reduction in food supply. Annual abundance indices for striped bass, young fall run chinook salmon, American shad, and longfin smelt show an increase with increases in flow rates during the spawning and early stages of life. High flows increase dispersal of young fish which may decrease density dependent mortality. Overall abundance of opossum shrimp appears to be reduced by salinity-incursion and increased water diversions. Salinity intrusion stimulates dispersal of salt-water species into more of the estuary, while habitat for freshwater species is reduced. Conversely, at the time of high spring runoff the salt-water habitat is reduced. This is thought to be the cause of the movement of juvenile dungeness crab out of the bay. (Brambley-SRC)

THE EFFECT OF FOREST CLEARCUTTING IN NEW ENGLAND ON STREAM-WATER CHEMISTRY AND BIOLOGY,

New Hampshire Univ., Durham. Northeastern Forest Experiment Station.
C. W. Martin, D. S. Noel, and C. A. Federer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153627, Price codes: A05 in paper copy, A01 in microfiche. Water Resource Research Center, University of New Hampshire, Research Report 34, July, 1981. 88 p, 13 Fig, 10 Tab, 52 Ref. OWRT-A-051-NH(1), 14-34-0001-8031.

Descriptors: *Clear-cutting, *Environmental effects, *Water quality, *Ecological effects, Algal growth, Invertebrates, Streamflow, *New England, Forest hydrology, Logging, Nutrient cycling, Water pollution, *Watershed management.

Changes in stream chemistry following clearcutting were sought in 56 streams at 15 locations throughout New England. Streams draining clearcut areas were compared with nearby streams in uncut watersheds over periods of up to 2 years. In general, concentrations of all elements studies (inorganic N, SO4 - S, Cl, Ca, Mg, K, Na), as well as pH and specific conductivity, varied as much among uncut streams at a location as between uncut and cutover streams. However, at most locations, at least one of these variables differed between uncut and cutover streams. The greatest differences occurred with nitrogen in northern hardwood forests in the White Mountains of New Hampshire. At 4 of the locations the effect of cutting on algae and invertebrates in the streams were also examined. Both algal and invertebrate densities were greater in cutover streams by factors of 2 to 4, probably because of increased light and temperature. The taxonomic composition of both algal and invertebrate populations was also changed by cutting. Partial cuts and sufficiently wide buffer strips can minimize both chemical and biological changes.

IMPACT OF SUBURBAN RESIDENTIAL DEVELOPMENT ON WATER RESOURCES IN THE AREA OF WINSLOW TOWNSHIP, CAMDEN COUNTY, NEW JERSEY,

Geological Survey, Trenton, NJ. Water Resources Div.
T. V. Fusillo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-124850, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 81-27, 1981. 38 p, 16 Fig, 7 Tab, 19 Ref.

Descriptors: *Urbanization, *Groundwater, *Water quality, *Surface water, Geohydrology, Urban runoff, Rainfall, Storm runoff, Detention reservoirs, Wastewater treatment, Chemical analysis, Observation wells, Water level, Unit hydrographs, Artificial recharge, Water analysis, *New Jersey, *Camden County, Great Egg Harbor River.

Changes in land use as a result of large-scale residential development can have significant impact on water resources. Data on the quality and quantity of surface water and ground water in the vicinity of the Winslow Crossing residential development, in Winslow Township, New Jersey, were collected from 1972 to 1979. Pumpage for water supply from the Cohansey Sand averaged 0.48 million gallons per day during 1978 and had little effect on water levels in the aquifer. Water quality was variable in the observation wells sampled. High levels of dissolved solids, nitrate-nitrogen, and phosphorus were found in the shallow ground water surrounding the effluent infiltration ponds of a wastewater treatment plant. A treatment process change in 1974 reduced nitrate-nitrogen levels. The development of 14 percent of a 1.64-square-mile drainage area resulted in an increase in the peak discharge of a 60-minute unit hydrograph from approximately 150 cubic feet per second to 270 cubic feet per second. Installation of a stormwater retention basin reduced this peak discharge to 220 cubic feet per second. Streams draining two highly developed drainage areas had significantly higher levels of calcium, magnesium, bicarbonate, and pH than streams draining less developed areas. Winslow Crossing's development had only a slight effect on Great Egg Harbor River in comparison with sources of contamination upstream from the study area. (USGS)

Geological Survey, Albany, NY. Water Resources Div.
B. Dunn.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $1.50, Microfiche $3.50. Geological Survey Open-File Report 81-1020, 1981. 10 p, 2 Fig, 2 Tab, 17 Ref.

Descriptors: *Flood profiles, *Flood frequency, *Flood recurrence interval, *Bridge design, Hydraulic properties, Flood flow, Flood discharge, Flood forecasting, Planning, *New York, Broome County, Chenango River.

Hydraulic analyses of the 50- and 100-year floods in a 3.2 mile reach of the Chenango River in the towns of Fenton and Chenango in New York were made to determine the effects of two alternative bridge designs on flood levels. Neither design would cause more than a 0.1-foot increase in water level of the 50-year flood nor more than a 0.2-foot increase in water level of the 100-year flood above levels that would occur during these floods under present channel conditions. The discharges used in the analyses were 55,200 cubic feet per second for the 50-year flood and 63,000 cubic feet per second for the 100-year flood. Mean flow velocities and water-surface elevations at 17 cross sections are given for both bridge designs and are compared with those that would occur under present conditions. (USGS)

Descriptors: *Aquatic life, *Benthic fauna, *Biological properties, *Water sampling, *Pollutant identification, Coliforms, Streams, Sediments, Ecosystems, National parks, Water quality, Water analysis, Hydrologic data, Seston, Phytoplankton, Periphyton, *California, Redwood National Park, Del Norte County, Humboldt County, Redwood Creek, Mill Creek, Logging.

A 2-year study of the aquatic biota in the Redwood Creek and Mill Creek drainage basins of Redwood National Park indicated that the aquatic productivity is low. Densities of coliform bacteria were low except in Prairie Creek, a tributary to Redwood Creek, where a State park, county fish hatchery, grazing land, lumber mill, and scattered residential areas are potential sources of fecal coliform bacteria. Benthic invertebrate data indicated a diverse fauna which varied considerably between streams and among stream sections. Noteworthy findings include: (1) benthic invertebrates rapidly recolonized the streambed following a major storm, and (2) man-caused disruption or sedimentation of the streambed during low flow can result in drastic reductions of the benthic invertebrate community. Seven species of fish representing species typically found in northern California coastal streams were captured during the study. Nonparametric statistical tests indicate that condition factors of steelhead trout were significantly larger at sampling stations with more insolation, regardless of drainage basin land-use history. Periphyton and phytoplankton communities were diverse, variable

in numbers, and dominated by diatoms. Seston concentrations were extremely variable between stations and at each station sampled. The seston is influenced seasonally by aquatic productivity at each station and amount of allochthonous material from the terrestrial ecosystem. Time-series analysis of some seston data indicated larger and sharper peak concentrations being flushed from the logged drainage basin than from the control drainage basin. (USGS)

WATER RESOURCES PROTECTION MEASURES IN LAND DEVELOPMENT - A HANDBOOK - REVISED EDITION,
Delaware Univ., Newark. Water Resources Center.
J. T. Tourbier, and R. Westmacott.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157967, Price codes: A10 in paper copy, A01 in microfiche. Office of Water Research and Technology Report OWRT TT/81 5, August, 1980. 196 p, 34 Fig. 14-34-0001-8707.

Descriptors: *Handbooks, *Watershed management, *Urbanization, Environmental protection, Land development, *Erosion control, Urban runoff.

This handbook contains descriptions of measures in urban development to prevent, reduce or ameliorate potential problems that would otherwise adversely affect water resources. These problems consist of runoff increases and decreases in infiltration and a greater degree of erosion and sedimentation, flooding, runoff pollution and discharge of sewage effluent. Issues have been analyzed individually in the Christina River Basin and, where possible, quantified. Measures are presented in groups and related directly to the problems listed above. Each group is preceded by a flow chart that relates measures and can aid in the selection of alternative techniques. Each measure is described, and site characteristics to which it is applicable identified. The application, advantages and disadvantages, design criteria and outline specifications, cost guidelines and maintenance, and legal implementation of each measure are individually covered. Illustrated case studies give examples of measures which have been constructed in the field.

Descriptors: *Viruses, *Enteroviruses, Shellfish, *Assay, Monitoring, Wastewater, Wastewater treatment, Enteric viruses, Immunoenzymatic assay, Poliovirus, *Pollutant identification, Bacterial analyses, Water analysis, Sediments.

A major problem that must be faced in assessing the microbiological quality of a wide variety of water sources is the identification of human enteric viruses. Monitoring programs based on estimating bacteriological contamination of water are of questionable value in predicting virus concentrations. Routine monitoring of surface, drinking, and recreational waters for virus content is severely hampered by the absence of a reliable, specific, and simple procedure for quantification of the number of virus particles present. This research was directed toward development of a methodology useful for assessing entero-virus contamination. The method is based on an immunoenzymatic assay in which virus specific antibody, to which is bound other antibodies and enzymes, is reacted with the virus. The complex can subsequently be visualized by addition of enzyme reagents which produce a color change in the presence of virus particles. Two forms of this assay have been developed, one using a microscopic visualization of the colored particles and the other based on reactions in a test tube with total color produced being used to quantify virus. Both methods offer promise of being able to count virus particles in moderately contaminated waters. Further development offers the promise of greater sensitivity. (Kiger, NC)

ALGAL-BACTERIAL SYMBIOSIS IN THE CHOWAN RIVER, NC,
North Carolina Univ. at Chapel Hill.
K. K. Gallucci.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153669, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, 1981. 63 p, 19 Fig, 4 Tab. OWRT-B-127-NC(3), 14-34-0001-0274.

Descriptors: *Nitrogen fixing bacteria, *Aquatic bacteria, Nutrients, Blue-green algae, Nuisance algae, Nitrogen fixation, Cycling nutrients, *Radioactive techniques, Bacteria, *Cyanophyta, Amino acids, *Chowan River, North Carolina.

Bacteria from the Chowan River, NC, were counted and isolated during the summer of 1980 and the significant species in the bloom area was identified as Pseudomonas aeruginosa (Schroeter) Migula. When this organism was added to axenic cultures of the blue-green alga Anabaena flosaquae (Lyng.) Breb., the total amount of nitrogen fixed (as determined by acetylene reduction) by the alga was substantially greater than that fixed by axenic controls. A radio-active assay was used to determine the chemotactic response of Pseudomonas aeruginosa to several amino acids, the primary units of blue-green algal nitrogenous exudates. Chemotaxis was observed, to some degree, towards all of the amino acids tested, although the bacterium did not utilize all of them for growth. Thus, in the Chowan River, chemotaxis is the likely mechanism whereby this bacterium detects nutrient-rich microzones along the algal filaments. Other studies have demonstrated that bacteria recycle nutrients in the algal microenvironment and enhance algal nitrogen fixation. Algal-bacterial symbiosis, based on nutrient exchanges, may be a significant factor in the proliferation of blue-green algal nuisance blooms such as those which have appeared on the Chowan River.

DETERMINATION OF DISSOLVED ORGANIC CARBON IN WATER,
National Inst. for Water Research, Pretoria (South Africa).
R. A. van Steenderen, and J. S. Lin.
Analytical Chemistry, Vol 53, No 13, p 2157-2158, November, 1981. 3 Fig, 4 Ref.

Descriptors: *Carbon, *Organic carbon, *Water analysis, Pollutant identification, Dissolved organic carbon, Organic compounds.

A published method for determination of dissolved organic carbon in water by oxidation to CO2 using a silica coil, ultraviolet radiation, and potassium persulfate catalyst has been modified. Optimum effective oxidant conditions for ethylenediamine tetraacetic acid, potassium biphthalate, and valine in water were 0.25% potassium persulfate catalyst and a 3 mm i.d. silica tube 1.8 meters long coiled around a 150 W ultraviolet lamp. Residence time in the coil was 1.5 min. No improvement in oxidation efficiency was produced by increasing digestion temperature, length of silica coil, ultraviolet lamp intensity, or silver or mercury salts as catalysts. Use of excessive acid for removal of inorganic carbon prior to analysis reduced recovey of dissolved organic carbon. (Casser-FRC)

CONTINUOUS-FLOW INJECTION ANALYSIS OF AQUEOUS ENVIRONMENTAL SAMPLES FOR CHEMICAL OXYGEN DEMAND,
Okayama Univ. (Japan). School of Engineering.
T. Korenaga, and H. Ikatsu.
Analyst, vol 106, No 1263, p 653-662, June, 1981. 8 Fig, 2 Tab, 16 Ref.

Descriptors: *Water analysis, *Chemical oxygen demand, *Wastewater, Oxygen demand, Monitoring, Industrial effluents, Municipal wastes, Domestic wastes, Continuous flow.

A method suitable for measuring chemical oxygen demand in various industrial wastewater samples down to levels of 5 micrograms/liter is presented and compared with results obtained using the Japanese Industrial Standard (JIS) method and conventional manual and automatic methods for the determination of organic pollutants. The method is based on flow injection analysis and uses acidic potassium permanganate solution as both an oxidant and a spectrophotometric reagent, and glucose as a standard. Chemical oxygen demand values for aqueous environmental samples, such as industrial wastewaters, are within an error range of plus or minus 30%. The method is comparable to other manual and automatic methods and has several advantages. A sampling rate of 20 samples per hour can be achieved, and the precision is 0.6%. Chloride ion up to levels of 6000 mg/liter does not interfere, even in the absence of silver salts. The major advantages include the following: the volume of sample used is only 20 microliters, the redox reaction can occur smoothly as the temperature of the reaction manifold can easily be controlled at 100 degrees C, an inexpensive and readily available spectrophotometer can be used for detection of the redox reaction products so that maintenance of apparatus is easily achieved, and the sampling of 20 samples/hr based on the principle of continuous flow injection analysis allows rapid analyses to take place. (Baker-FRC)

DISSOLVED HUMIC SUBSTANCES: A MAJOR SOURCE OF ERROR IN FLUOROMETRIC ANALYSES INVOLVING LAKE WATERS,
Kent State Univ., OH. Dept. of Biological Sciences.
R. E. Carlson, and J. Shapiro.

Limnology and Oceanography, Vol 26, No 4, p 785-790, July, 1981. 3 Fig, 5 Tab, 12 Ref.

Descriptors: *Fluorescence, *Humic acids, *Chlorophyll, Pollutant identification, Organic matter, *Lakes, Errors, Algae, Color.

Dissolved humic substances in fresh waters may be an important source of error in fluorometric analyses such as the in vivo measurement of chlorophyll (Lorenzen, 1966). Fluorescence measurements were taken in lake water samples passed through millipore filters. These tests determined that soluble fluorescence was not a result of: (1) the filter, (2) algal cell breakage, or (3) passage of small particles of chlorophyll through the filter. Water from three lakes, high in dissolved color and low in chlorophyll, had errors of 1.05 to 1.77 per unit of fluorescence. In one case, fluorescence estimated 59 mg per liter chlorophyll where only 5.6 mg per liter was present. A second peak at 730 nm was found in a spectrofluorometric scan of a dried sphagnum peat filtered extract. This peak is probably responsible for the soluble fluorescence found with the in vivo chlorophyll technique. Humic extracts from lake water also fluoresced strongly, the soluble fluorescence decreasing at lower pH. The method may be corrected by subtracting soluble fluorescence from total fluorescence before calculating in vivo chlorophyll or possibly by using an appropriate narrow-spectrum secondary filter. PCBS IN THE HOUSATONIC RIVER: DETERMINATION AND DISTRIBUTION,

Connecticut Agricultural Experiment Station, New Haven.
B. L. Sawhney, C. R. Frink, and W. Glowa.
Journal of Environmental Quality, Vol 10, No 4, p 444-448, October/December, 1981. 3 Fig, 1 Tab, 27 Ref.

Descriptors: *Polychlorinated biphenyls, *Sediments, *Sorption, Fate of pollutants, Pollutant identification, *Housatonic River, Lake Lillinonah, *Connecticut, Chlorinated hydrocarbons, Humic acid, Organic matter, Clays, Aroclors, River beds, Bottom sediments, Organic compounds.

Individual polychlorinated biphenyls (PCBs) were estimated in samples of sediments from the Housatonic River using multiple linear regression of peak heights (or areas) from gas chromatograms. Proportions of Aroclors 1248, 1254, and 1260 were 1.0:0.6:1.9. Analysis of sediments in a 20 km section of the river forming Lake Lillinonah showed high correlation between PCB concentrations and clay and organic matter, suggesting that the primary means of PCB retention and transport is fine particles consisting of clay-organic matter complexes. Concentrations of PCBs in different fractions of one sediment sample were: fine clay size (< 0.2 microns), 9.7 ppm; coarse clay (0.2-2 microns), 4.6 ppm; and silt (2-50 microns), 0.5 ppm. Laboratory sorption experiments with different materials indicated that humic acid adsorbed the most PCBs, followed by river sediment, river sediment with organic matter removed, and clays. Of the clays, illite sorbed the most PCB, kaolinite the least, with vermiculite and montmorillonite, intermediate. (Cassar-FRC)

PRECONCENTRATION OF PHENYLMERCURY, METHYLMERCURY AND INORGANIC MERCURY FROM NATURAL WATERS WITH DIETHYLAMMONIUM DIETHYLDITHIOCARBAMATE-LOADED POLYURETHANE FOAM,

Eotovs Lorand Univ., Budapest (Hungary). Inst. of Inorganic and Analytical Chemistry.
T. Braun, M. N. Abbas, L. Bakos, and A. Elek.
Analytica Chimica Acta, Vol 131, p 311-314, 1981. 2 Fig, 2 Tab, 16 Ref.

Descriptors: *Mercury, *Natural waters, Water analysis, Chemical analysis, Polyurethane foam, Methylmercury, Phenylmercury.

Stable dithiocarbamate-loaded polyurethane foam is easily prepared and allows a very fast extraction of inorganic mercury and organomercurials even from high volumes of solution. These loaded foams are suggested as a universally available preconcentrating sorbent for inorganic mercury (II) ions and also for methyl- and phenyl-mercurials. The diethyldithiocarbamate-loaded foam was prepared by soaking the foam in the appropriate amount of reagent solution to yield a concentration of 30% on the foam. Sulfuric acid or sodium hydroxide was used to adjust the pH to the required values. The sampl solution was percolated through the DDC-foam column at a flow rate of 50 ml/min. Mercury (II) ions were extracted over a wide pH range; the extraction was almost quantitative, even at very low pH values. Due to the very low concentration of mercury in natural waters, preconcentration from sample volumes of 10 liters or more is usually needed. The extraction rate of organomercurials was slower than that of inorganic mercury. Mercury was quite firmly held on the DDC-foam. Less than 0.3% of the total amount retained on the foam was washed out by percolation of 1 liter of water through the column. Inorganic mercury, the organomercurials and the reagent itself were completely eluted from the foam with 100 ml of acetone. (Baker-FRC)

DETERMINATION OF 2,4-DICHLOROPHENOXYACETIC ACID AND SILVEX IN WATER WITH HIGH-PERFORMANCE LIQUID CHROMATOGRAPHY,

Calgon Corp., Pittsburgh, PA.
C. W. Vaughan.
Analytica Chimica Acta, Vol 131, p 307-310, 1981. 2 Tab, 6 Ref.

Descriptors: *Chemical analysis, *Water, Organic compounds, Herbicides, Pesticides, *Drinking water, Chromatography, Measuring instruments, Silvex, 2-4-D, *Pollutant identification.

A method is proposed for the determination of 2,4-D and silvex in drinking water supplies at the microgram/liter level. The method is based on liquid/liquid extraction and high performance liquid chromatography. Sample preparation for water samples is simplified. The ranges of linear response are 50 - 60 nanograms to 60 micrograms for 2,4-D and 30 nanograms to 60 micrograms for silvex. The average recoveries of 2,4-D at the 10 microgram/liter and 1 microgram/liter levels are 91 and 120%, respectively. The average recoveries of silvex at the 10 microgram/liter and 1 microgram/liter levels are 85 and 110%, respectively. This method obviates the need for three steps: filtration of the sample extract through acidified sodium sulfate, esterification of the herbicide acids, and clean-up of the esterified sample extract with a micro-Florisil column. These steps are major contributors to the poor precision of the gas chromatography based method. (Baker-FRC)

DETERMINING MAXIMUM INFLUENT CONCENTRATIONS OF PRIORITY POLLUTANTS FOR TREATMENT PLANTS,

Enviroscience Inc., Minneapolis, MN.
R. M. Anthony, and L. H. Breimburst.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1457-1468, October, 1981. 2 Fig, 10 Tab, 14 Ref.

Descriptors: *Water treatment, *Water quality standards, *Wastewater analysis, *Physicochemical treatment, Sludge disposal, Pollutants, *Pollutant identification, Sludge digestion, Nitrification, Water analysis, Sludge drying, Influent streams, Wastewater treatment, Industrial wastes, Mathematical studies.

A general analytical method used to arrive at maximum influent priority pollutant levels for water treatment plants is described. The priority pollutants present in the collection system should be determined, and available information on industrial processes, industrial waste water analyses, and waste water treatment plant and sludge analyses should be obtained. Limiting concentrations should be studied with respect to inhibition of wastewater and sludge treatment processes, effluent standards and sludge disposal. These concentrations may be determined from past plant data, from data from similar plants, and from state and federal requirements. Analytical methods are given for secondary treatment with sludge digestion and disposal, secondary treatment with nitrification, effluent filtration, sludge digestion and disposal, and physical-chemical treatment with sludge dewatering and disposal. Procedures are outlined for determining the limiting influent concentrations of priority pollutants. Maximum influent priority pollutant concentrations for the facility are recommended based on these limiting influent concentrations. (Geiger-FRC)

EVALUATION OF AUTOMATIC SUSPENDED SOLIDS SAMPLING PROCEDURES,

Tennessee Univ., Knoxville.
G. D. Reed.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1481-1491, October, 1981. 8 Fig, 1 Tab, 9 Ref.

Descriptors: *Suspended solids, *Water sampling, *Wastewater, Wastewater treatment, Sampling, Stokes law, Streamflow, Particle size, Synthetic hydrology, Municipal wastewater, Flow velocity, Sedimentation.

A synthetic waste water solid was devised to test the validity of a suspended solids sampling technique to decide on a representative point for the collection of samples from a wastewater stream. Results showed that as the particle sizes of the solids increased, their rate of recovery at smaller depths decreased within a sampling stream. Since the particle distribution was a function of settling and stream flow velocity, a nearly direct relationship resulted between the recovery of non-filterable solids (NFS) and flow velocities. The inlet to a waste treatment system is not always the best site for collecting a representative sample for solids in a raw wastewater. The hydraulic jump site, which provides a high degree of mixing by natural causes, produced NFS values that were 26% too low. A good sampling point must feature thorough mixing, or else data must be calibrated to reflect true parameter magnitudes. Further investigations are suggested to discover sampling techniques which would be applicable to various type of wastewaters. (Geiger-FRC)

POSITIVELY CHARGED FILTERS FOR VIRUS RECOVERY FROM WASTEWATER TREATMENT PLANT EFFLUENTS,

Wisconsin Univ.-Madison. Dept. of Veterinary Science.
L. T. Chang, S. R. Farrah, and G. Bitton.
Applied and Environmental Microbiology, Vol 42, No 5, p 921-924, November, 1981. 2 Tab, 20 Ref.

Descriptors: *Virus, *Membrane filters, *Wastewater analysis, Pollutant identification, Effluents, Coxsackie virus, Poliovirus, Micro-organisms, Filters.

Enteroviruses from activated sludge effluent were collected on positively charged Zeta Plus membrane filters and eluted with a solution of 4 M urea buffered at pH 9 with 0.05 M lysine. No salt or acid addition was necessary to enhance virus adsorption onto the filters. 40-56% of the poliovirus Type I (LSc) and coxsackievirus B3 added to 19

liters of effluent were recovered and concentrated to final volumes of 1 or 2 ml using flocculation. The economical, efficient, simple method was used on seven effluent samples from two sewage treatment plants. Three types of poliovirus and one coxsackievirus were identified. One sample contained no detectable virus. (Cassar-FRC)

A CLOSE-INTERVAL SAMPLER FOR COLLECTION OF SEDIMENT PORE WATERS FOR NUTRIENT ANALYSES,

Harbor Branch Foundation, Inc., Ft. Pierce, FL.
J. R. Montgomery, M. T. Price, J. Holt, and C. Zimmermann.
Estuaries, Vol 4, No 1, p 75-77, March, 1981. 2 Fig, 7 Ref.

Descriptors: *Sedimentation, *Sampling, Measuring instruments, Bottom sampling, Acidity, *Pore water, Sulfates, Sulfides, Ammonia, Nutrients, Trace metals, Organic matter, Salinity, Dissolved oxygen, Interstitial water, *Pollutant identification.

This paper describes a single, in situ sampler which simultaneously samples four 1 cm sampling surfaces at 2 cm intervals. This sampler requires minimal sample manipulation, minimizes sediment disturbance, maintains an anaerobic sample environment, and can be used over extended periods of time to sample at one location. The sampler is composed of a tube with a nose cone which facilitates insertion into the sediment. The tube is separated into a layered filter section, a tubular extension to facilitate handling, and a top section which provides the needed connections to the internal sample chambers. Laboratory tests indicate 98 to 100% recoveries for ammonium, silicate, reactive phosphate, nitrate and nitrite. Vertical profiles for ammonium, reactive phosphate and silicate are shown from field studies. Potential applications include analysis of pore waters for trace metals, dissolved organic carbon, sulfides, sulfates, salinity, Eh, dissolved oxygen, and pH. (Baker-FRC)

ENUMERATION OF HETEROTROPHIC BACTERIA IN RIVER WATERS BY USING A LOW NUTRIENT MEDIUM (IN JAPANESE),

Osaka City Inst. of Public Health and Environmental Sciences (Japan).
T. Yoshikura, K. Oda, and S. Iida.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 47, No 2, p 183-189, February, 1981. 6 Fig, 1 Tab, 12 Ref. (English summary).

Descriptors: *Bacteria, *Rivers, Eutrophication, *Nutrients, Culture media, Agars, Microbial analysis, Seasonal variation.

Agar media containing different concentrations of organic nutrients were used to enumerate heterotrophic bacteria in river waters of various degrees of eutrophication. Low nutrient agar medium (0.5 g polypeptone, 0.25 g yeast extract, 0.1 g glucose, and 15 g agar in 1,000 ml distilled water) revealed higher counts of bacteria in any station at any season than did the high nutrient media. This suggests that for recovering heterotrophic bacteria inhabiting river waters the low nutrient medium is superior. Bacteria isolated from less polluted waters were more sensitive to high nutrient concentrations than those from highly polluted waters. This was determined in experiments on the growth response of bacteria to the concentration of organic nutrients. It appeared that the incubation temperature for counting must be selected in accordance with water temperature in the river as the higher counts of bacteria in river waters were obtained at about 35 degrees C in the summer and at about 20 degrees C in the winter. (Baker-FRC)
W82-02352

THE SPECTROPHOTOMETRIC DETERMINATION OF ANTIMONY IN WATER, EFFLUENTS, MARINE PLANTS AND SILICATES,

Liverpool Univ. (England). Dept. of Oceanography.
A. H. Abu-Hilal, and J. P. Riley.
Analytica Chimica Acta, Vol 131, p 175-186, 1981. 3 Fig, 7 Tab, 43 Ref.

Descriptors: *Chemical analysis, *Antimony, Water analysis, Sea water, Effluents, Silicates, Spectrophotometry.

A procedure is developed which concentrates antimony by precipitation with hydrous zirconium oxide prior to solvent extraction and spectrophotometry. The technique has also been applied to the determination of traces of antimony in digesters from marine algae and silicates. After a preliminary oxidative digestion for waters, or acid attack for algae and silicates, the element is quantitatively coprecipitated at pH 5.90 with hydrous zirconium oxide. The precipitate is dissolved in acid and reduced with titanium(III) chloride. Subsequently the antimony is oxidized to antimony (V) with sodium nitrite. The ion pair of the antimony chloride ion with crystal violet is extracted with benzene, and its absorbance is measured at 610 nm. Extraction with toluene causes some loss of sensitivity. The detection limit is 0.005 micrograms/liter. Relative standard deviations are 0.5% and 1.1% for spiked distilled water and sea water, respectively. A wide range of anions and cations caused no interference at levels many times those in natural waters. The technique can be adapted for application to marine algae and silicates. Relative standard deviations were 1.8% and 2% for samples of Pelvetia canaliculata and a Pacific Ocean red clay, respectively. Results for the US Geological Survey Standard rocks GSP1 (2.7 ppm) and DTS1 (0.53 ppm) are in good agreement with those of earlier workers. (Baker-FRC)

DETECTION OF CHLOROFORM IN THE TISSUES OF FRESHLY EVISCERATED POULTRY CARCASSES EXPOSED TO WATER CONTAINING ADDED CHLORINE OR CHLORINE DIOXIDE,

Agricultural Research Council, Norwich (England). Food Research Inst.
D. Robinson, G. C. Mead, and K. A. Barnes.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 2, p 145-150, 1981. 2 Tab, 10 Ref.

Descriptors: *Chlorination, *Chloroform, *Poultry, Food processing industry, Foods, *Bioassay, Sodium hypochorite, Chlorine dioxide, Chlorine, Industrial water, Water treatment.

The effects of super-chlorinated process water on poultry carcasses were investigated. Concentrations of 5-20 mg/liter free available chlorine may be used for in-plant chlorination of the water of immersion chilling systems. Chlorine is added, usually in the form of sodium hypochlorite, to significantly reduce the bacterial load of the chill-water and to extend the shelf-life of the chill-stored carcasses. Chlorine dioxide was also investigated; it may be used more in the future, as it reduces the formation of trihalomethanes. Twenty-eight chickens were used in the study: five were controls, and batches of three received varying treatments. Birds treated with chlorinated water were tested after cooking for chloroform formation and persistence of chlorine at the point of consumption. The highest concentrations of chlorine occurred in birds immersed in water containing 50 mg/liter of chlorine, especially those held at 15-16 deg C. (Small-FRC)

MODEL EXPERIMENTS ON THE GROWTH OF ENTERIC BACTERIA IN FRESH AND SEA WATER,

Toyama Univ. (Japan).
T. Yanagita, and M. Takagi.
Journal of General and Applied Microbiology, Vol 26, No 4, p 299-305, August, 1980. 4 Fig, 6 Ref.

Descriptors: *Bacteria, *Sea water, *Aquatic environments, *Enteric bacteria, *Experimental design, Oligotrophic lakes, Escherichia coli, Nutrients, Laboratory equipment, Dilution, Salinity, Rivers, Marine bacteria.

The growth of some enteric bacteria with and without added sodium chloride at the concentration of sea water was measured. An apparatus capable of making exponential changes in nutrient and salt concentrations was employed. Growing cultures of E. coli were subjected to nutrient dilutions and to salt solutions over a three week period. Cell densities came to be maintained at a steady-state level preceded by a transitional process related to the changes in environment. This suggests that E. coli cells are able to grow under extreme conditions, though at a restricted rate. (Titus-FRC)

DETERMINATION OF AMMONIA IN ESTUARY,

Tokai Regional Fisheries Research Lab., Tokyo (Japan). Div. of Oceanography.
K. Sasaki, and Y. Sawada.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 3, p 319-321, March, 1980. 6 Fig, 2 Tab, 2 Ref.

Descriptors: *Ammonia, *Estuaries, *Colorimetry, Color, Salts, Detection times, Temperature effects, Seawater, Salinity.

The development of a blue color with indophenol was investigated as a method for the determination of ammonia in estuaries. The effects of temperature and salt concentration on the color development were examined. Reaction temperature influenced the time required for the completion of the color development and the absorbance upon completion. Salt concentration also affected color development and absorbance. Color development at 40 deg C was complete even in seawater and the differences in absorbance was small. In contrast, the salt error was 60 in freshwater and 73 in seawater when the temperature was 20 deg C. The reasons for the effects of temperature and salt concentration are not known. (Small-FRC)

Descriptors: *Bromine, *Bromamines, *Colorimetry, Disinfection, Trace elements, Nitrite, Chemical reactions, Chlorine, Dilution, Laboratory equipment, Water sampling, Chemical analysis, Residual chlorine, Reagents.

A separate determination of bromine and bromamines may be accomplished by the use of sodium nitrite as a supplementary reagent. Free chlorine, chlorine dioxide, bromine, and bromamines all respond in the first step of the DPD method for determining residual disinfectants in water. With the use of sodium nitrite, the chlorine dioxide readings may also be corrected for any associated traces of free or combined bromine. Following the first step of the normal DPD procedure, addition of sodium nitrite at 50 mg NaNo2/100 ml sample destroyed free bromine without alteration of bromamine readings. However, the presence of nitrite led to fading of the developed colors at the rate of about 4%/min at 20 C. (Titus-FRC)

CADMIUM, COPPER, LEAD, ZINC AND MANGANESE IN THE POLYCHAETE ARENICOLA MARINA FROM SEDIMENTS AROUND THE COAST OF WALES,

University Coll. of Wales, Aberystwyth. Dept. of Zoology.
D. M. Packer, M. P. Ireland, and R. J. Wootton.
Environmental Pollution (Series A), Vol 22, No 4, p 309-321, August, 1980. 6 Fig, 2 Tab, 38 Ref.

Descriptors: *Heavy metals, *Polychaetes, *Absorption, Marine animals, Sediments, Coastal waters, *Pollutant identification, Metals, Mine wastes, *Wales, Bristol Channel, Liverpool Bay, Cardigan Bay, Arenicola marina, Cadmium, Zinc, Copper, Lead, Manganese, Estuarine environment.

Metal concentrations in the marine polychaete Arenicola marina and the sediments it inhabits were studied at 24 sites along the coast of Wales, Liverpool Bay (polluted from domestic and industrial outfalls), Cardigan Bay (industry-free, but receiving runoff from former mining operations), and Bristol Channel (domestic and industrial sewage plus minerals from mining wastes). Eight of the sites were estuarine in nature; six of these were located along the Bristol Channel. Highest concentrations (in ppm) in A. marina found were in the upper region of Bristol Channel as follows: Cd, 32; Pb, 90; Zn, 430; and Mn, 320. Highest Cu levels were 40 ppm at Dulles Bay in the north. Mean body weight and mean concentration of individual metals in A. marina were negatively correlated. A positive correlation was seen between concentration of metals in A. marina and sediment for Zn and Cd. Mn was far less concentrated in tissues than in the sediment, Pb was similar in both, Cu and Zn were 2 to 3 times more concentrated, and Cd 11 more times concentrated. (Cassar-FRC)

GROUNDWATER QUALITY IN THE SEVERN-TRENT REGION,

Severn-Trent Water Authority, Birmingham (England). Directorate of Scientific Services.
J. L. Lucas, and R. I. G. Simm.
Water Pollution Control, Vol 80, No 3, p 317-332, 1981. 5 Fig, 1 Tab, 27 Ref.

Descriptors: *Groundwater, *Water quality, *Monitoring, Chlorides, Nitrogen, Sulfates, Acidity, Calcium, Magnesium, Sodium, Potassium, Groundwater pollution, Boreholes, Wells, Aquifers, *United Kingdom, Severn-Trent Water Authority.

The Severn-Trent Water Authority's program for monitoring the quality of groundwater is reviewed. The aquifer protection policy is based on the identification of groundwater resource vulnerability in terms of hydrogeology and the classification of practices likely to be unacceptable within each resource risk area. A Groundwater Chemistry Network was established to provide baseline data essential to the understanding of the mechanisms and processes controlling groundwater quality and the establishment of long term trends, to provide a reference against which possible sources of pollution may be revealed, to facilitate full and proper exploitation of groundwater reserves, and to provide data for existing and potential abstractions. Samples from selected sites are taken quarterly and analyzed for temperature, pH, ammonium N, total oxidized nitrogen, chloride, sulfate, alkalinity, total hardness, calcium, magnesium, sodium, potassium, and electrical conductivity. Total organic carbon, fluoride, orthophosphate, and total iron, manganese, cadmium, chromium, copper, lead, nickel, zinc and barium are analyzed annually. The site selections are made in such a manner that they are not immediately adjacent to any obvious potential source of pollution, that the groundwater sample pumped shall be representative of water from a significant volume of the aquifer and not be influenced by chemical changes due to standing for long periods, and that the sample shall be from a borehole or deep well so that as great a thickness of the aquifer as possible is sampled. DISTRIBUTION ON VIABLE MARINE BACTERIA IN NERITIC SEAWATER AROUND JAPAN,

Tokyo Univ. (Japan). Ocean Research Inst.
K. Kogure, U. Simidu, and N. Taga.
Canadian Journal of Microbiology, Vol 26, No 3, p 318-323, 1980. 5 Fig, 4 Tab, 13 Ref.

Descriptors: *Water analysis, *Bacteria, *Bacterial analysis, Measuring instruments, Eutrophication, Temperature effects, Stratification, Sea water, Marine bacteria, Marine plants, Marine biology, Marine environment, *Tokyo Bay.

A new direct viable count (DVC) method has been reported which is aimed at counting the living bacterial cells using a relatively simple procedure for routine work in neritic seawater. This method was applied to various marine samples from environments with different degrees of eutrophication. The temperature and salinity profiles in Tokyo Bay show typical stratification during the summer season. At several stations the particulate organic carbon exceeded the dissolved organic carbon, indicating the continuous input of large amounts of particulate matter from the rivers or abundant growth of various organisms in the seawater. High nutrient concentrations resulted in dense, flourishing phytoplankton populations throughout most of the year in the bay. Almost complete vertical mixing of the water column at one station was due to the proximity of a typhoon just before the day of sampling. The distribution of bacteria reflects the extent of eutrophication in the bay. A gradual decrease in bacterial numbers was noted toward the outer part of the bay. In offshore waters the majority of DVC cells were free-living, and it was very rare to find particles which were heavily colonized with bacterial cells. In Tokyo Bay, however, such particles were often found at several sample stations. They appeared to be freshly produced detrital particles and usually contained degrading algal cells or fibrous structures. These findings suggest that the DVC technique may be used for various aquatic environments as a relatively simple counting technique for living bacteria. (Baker-FRC)

DISTRIBUTION OF RIBONUCLEIC ACID COLIPHAGES IN RAW SEWAGE FROM TREATMENT PLANTS IN JAPAN,

Keio Univ., Tokyo (Japan). Dept. of Molecular Biology.
K. Furuse, A. Ando, S. Osawa, and I. Watanabe.
Applied and Environmental Microbiology, Vol 41, No 5, p 1139-1143, May, 1981. 2 Tab, 11 Ref.

Descriptors: *Wastewater, *Viruses, *Japan, Coliforms, Wastewater composition, Wastewater analysis, *Coliphages, Ribonucleic acid, Feces, Water pollution sources, Microbiological studies, Raw wastewater.

Raw sewage samples were collected from wastewater treatment plants in 16 Japanese cities and analyzed for content of Groups I-IV RNA coliphages. The raw sewage contained human wastes, slaughterhouse wastes, municipal wastewater, and industrial wastewater. Two-milliliter sewage samples were mixed with an equal volume of peptone-glucose medium. Bacteria were killed with chloroform, and the samples were centrifuged. The supernatants were plated onto E. coli strains. The resultant plaques were collected for use as phage stocks and grouped by the serological method. Total coliphage densities were fairly high, ranging from 10 to 1,000,000 plaque-forming units per ml of original phage samples. Group III phages predominated over group II phages. Appreciable amounts of group I phages were also present, suggesting the presence of animal feces in the samples. Reported RNA phage distribution patterns in raw sewage collected from Mexico, Saudi Arabia, Australia, the United States, Brazil, the Philippines, and West Germany followed patterns similar to those for Japan, indicating an absence of special phage-host relationships between RNA phage groups and human races. A complete transmission cycle of group I phages in animals appeared to be present. A similar cycle is possible for the groups II and III phages, but the frequencies of isolation of these phages in human feces appeared to be low. (Carroll-FRC)

ENCHYTRAEID OLIGOCHAETES AS MARINE POLLUTION INDICATORS,

Victoria Univ. (British Columbia). Dept. of Biology.
K. Coates, and D. V. Ellis.
Marine Pollution Bulletin, Vol 11, No 6, p 171-174, June, 1980. 1 Fig, 2 Tab, 6 Ref.

Descriptors: *Indicators, *Oligochaetes, *Pollutants, Bioindicators, Marine environment, Industrial wastewater, *Pulp wastes, Feasibility studies, Water pollution effects, Distribution patterns, Estuarine environment.

The possibility of using enchytraeid oligochaetes as indicators of pulp mill pollution in the littoral zone has been investigated as part of a project at the Port Alice (Vancouver Island) pulp mill designed to develop measures for monitoring ecosystem recovery following the application of pollution control procedures. Analyses of sediment core samples from several locations within a pulp mill waste receiving area, including the Cayuse and Cayeghle estuaries, resulted in the identification of 15 species of enchytraeid oligochaetes. One of those, Lumbricillus lineatus, which is a known stress-resistant intertidal form not normally found along the coasts of British Columbia, was found to be predominant within 1.5 kilometers of the pulp mill outfall. Beyond that distance, a variable association of 14 other species from the genera Lumbricillus, Marionina, and Enchytraeus was dominant. L. lineatus has only been collected adjacent to three pulp mills in British Columbia. It was not collected at five other pulp mills or at ten undisturbed intertidal stations where other diverse associations of Enchytraeid species were found. L. lineatus has apparently been introduced to these sites in the Pacific Northwest by international ship traffic. The spatial distribution of L. lineatus close to the mill was found to correspond with oxygen levels reduced well below saturation and with visible but fluctuating levels of mill effluent, indicating that the species has the potential to index the area showing substantial impact of the discharges on the coastal environment. The most practical index is the percentage of total adult enchytraeids, represented L. lineatus. (Carroll-FRC)

BIOASSAYS OF WATERS FROM THE SEVERN AND THAMES RIVER SYSTEMS,

Northwest Water Authority (England).
A. Collie, and J. W. G. Lund.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 2, p 180-188, March, 1980. 1 Fig, 2 Tab, 23 Ref.

Descriptors: *Rivers, *Bioassay, *Bioindicators, *Plankton, Hydrological data, Growth rates, Assay, Algae, Nutrients, Water treatment, Growth kinetics, Aquatic environment, Aquatic organisms, Dilution, Mixing, Flow, Water sampling, *Thames River, *Severn River, England.

A diatom and a green alga were used as test organisms to assess the potential fertility of water from parts of the Severn and Thames Rivers in England. Water samples were taken monthly at a

constant depth and results for the two rivers were compared. Growth rates in the Severn were significantly lower than in the Thames. However, both waters were highly fertile. Results suggest that limitations of algal numbers are due to physical and biological factors rather than chemical ones. A transfer of water from the Severn to the Thames would not significantly alter the algal regime. (Titus-FRC)

WATER-QUALITY RECONNAISSANCE OF THE LARKIN CREEK WATERSHED, LEE AND ST. FRANCIS COUNTIES, ARKANSAS,

Geological Survey, Little Rock, AR. Water Resources Div.
J. C. Petersen.
Available from the OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Prices: $3.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 81-819, 1981. 20 p, 1 Fig, 3 Tab, 8 Ref.

Descriptors: *Water quality, *Surface water, *Streams, *Pollutant identification, *Data collections, Streamflow, Water measurement, Water sampling, Bottom sampling, Bottom sediments, Dissolved solids, Bacteria, Nutrients, Metals, Pesticides, Water analysis, *Arkansas, Lee County, St. Francis County, Larkin Creek watershed.

A reconnaissance of the Larkin Creek watershed in Arkansas was made during April through September 1980 to assess the water quality of streams in the watershed. Streamflow was measured and water samples were collected three times during the study period. Samples of bottom material were collected in September. Concentrations of dissolved solids ranged from 45 to 391 milligrams per liter. Water hardness ranged from 31 milligrams per liter (soft) to 280 milligrams per liter (very hard). Fecal-coliform bacteria densities ranged from 40 to an estimated 540 colonies per 100 milliliters and may have exceeded the U.S. Environmental Protection Agency criterion for bathing waters. Total nitrogen concentrations ranged from 0.90 to 2.2 milligrams per liter. Total phosphorus concentrations often exceeded the State standard and ranged from 0.08 to 0.46 milligrams per liter. Low dissolved-oxygen concentrations (2.5 to 5.4 milligrams per liter at midday) were measured in Larkin Creek and a major tributary. Iron (290 to 9,800 micrograms per liter), manganese (60 to 3,100 micrograms per liter), and mercury (0.0 to 0.2 micrograms per liter) concentrations at times exceeded Environmental Protection Agency criteria for domestic use or freshwater aquatic life. High concentrations of toxaphene (20 to 170 micrograms per kilogram dry weight) were present in all bottom-material samples. In two water samples, concentrations of dieldrin (0.01 micrograms per liter) exceeded the Environmental Protection Agency criterion for freshwater aquatic life. Polychlorinated biphenyls, several insecticides, and several herbicides (including 2, 4, 5-T) were present in water or bottom-material samples. (USGS)

COMPARISON OF GROUNDWATER AND SURFACE WATER FOR PATTERNS AND LEVELS OF CONTAMINATION BY TOXIC SUBSTANCES,

Wisconsin Univ.-Milwaukee. Dept. of Urban Planning.
G. W. Page.
Environmental Science and Technology, Vol 15, No 12, p 1475-1481, December, 1981. 1 Fig, 7 Tab, 30 Ref.

Descriptors: *Groundwater pollution, *Chemical wastes, *Surface-groundwater relations, *Toxins, Chlorinated hydrocarbons, Organic compounds, Pesticides, Insecticides, Heavy metals, Metals, Carcinogens, New Jersey, Surface water, Fate of pollutants, Pollutant identification, Water pollution, Drinking water, Wells.

Groundwater is as contaminated with toxic substances as surface water throughout New Jersey. This conclusion is contrary to most of the scientific literature, which indicates that surface waters are more polluted than groundwater, except in isolated cases. Water samples from 1000 wells and 600 surface water sites in areas representing all counties and all types of land use were analyzed for 56 toxic substances: 27 light chlorinated hydrocarbons, 20 heavy chlorinated hydrocarbons, and 9 heavy metals. Comparisons of maximum concentrations show that for 64% of the toxic substances the highest concentration is in groundwater and for 36% the highest concentration is in surface water. The probability of detection was greater in surface water for 54% of the toxics. For 44% there was no significant difference, and for 2% the probability of detection was greater in groundwater. Comparing only those samples with detectable concentrations of the toxic material being tested, 78% of the toxic materials have an average concentration at least as great in groundwater as in surface water. (Cassar-FRC)

CERIOMETRY, A COMBINED METHOD FOR CHEMICAL OXYGEN DEMAND AND DISSOLVED OXYGEN (WITH A DISCUSSION ON THE PRECISION OF THE WINKLER TECHNIQUE),

Station Biologique de la Tour du Valat, Arles (France).
H. L. Golterman, and A. G. Wisselo.
Hydrobiologia, Vol 77, No 1, p 37-42, 1981. 5 Tab, 11 Ref.

Descriptors: *Dissolved oxygen, *Chemical oxygen demand, *Cerium compounds, Winkler method, Pollutant identification, Colorimetry, Oxygen.

A rapid colorimetric method for determination of dissolved oxygen and COD uses Ce(3+) salts and Ce(4+) salts, respectively. This is an improvement over the Winkler method for dissolved oxygen determination, which does not distinguish between oxygen and COD. the interfering organic matter may be treated with Ce(4+) at low or high temperatures, depending on the oxidizability of the substances. The method was tested on oxygen saturated solutions high in COD, using oxalic acid, glycine, polluted lake water, or lake water high in chlorophyll a. The standard deviation is typically 1% of the mean, and accuracy is comparable to that of the Winkler method. (Cassar-FRC)

ASSESSMENT METHODOLOGIES FOR FRESHWATER INFLOWS TO CHESAPEAKE BAY,

Environmental Protection Agency, Annapolis, MD.
C. J. Klein, O. P. Bricker, D. A. Flemer, T. H. Pheiffer, and J. T. Smullen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/004, Vol I, October, 1981, p 185-199, 4 Fig, 9 Ref.

Descriptors: *Estuarine environment, *Model studies, *Water quality, *Nonpoint pollution sources, Runoff rates, Simulation, Nutrients, Land use, Mathematical models, Consumptive use, *Chesapeake Bay, Freshwater inflow.

The EPA Chesapeake Bay program is conducting an in-depth study to assess the principal factors having adverse impacts on the water quality of the bay. The program focuses on the point and nonpoint sources of pollution including nutrients and toxic chemicals that are associated with various land use practices. Water quality data will be evaluated through use of stochastic and deterministic models. Field data collected on specific land uses from five test basins will be the basis for research to verify nonpoint source runoff rates. The field data will be used to calibrate and verify mathematical models in the test basins including nonpoint source loading, stream transport and estuarine processes. In particular, the estuarine models will simulate the impacts of nutrients on water quality. Fall line water quality data will serve as an independent data set to compare the point and nonpoint source projections associated with various land use activities. Mathematical models will be employed on a bay-wide scale to generate nonpoint source loadings basin-wide and to assess the impact from those loading on the tidal bay for the present (1980) and future (2000) conditions. Several growth scenarios that include consumptive freshwater use will be evaluated for their impact on water quality in the bay.

WATER BUDGET AND PROJECTED WATER QUALITY IN PROPOSED MAN-MADE LAKES NEAR ESTUARIES IN THE MARCO ISLAND AREA, FLORIDA,

Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. C. Huber, and P. L. Brezonik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81-04, Vol I, Oct. 1981. p 241-251, 2 Fig, 4 Tab, 11 Ref.

Descriptors: *Hydrologic budget, *Water quality, *Artificial lakes, *Nutrients, Eutrophication, Saline water, Chemocline, Runoff, Phosphorus, Nitrogen, Transparency, Marco Island area, *Florida.

The proposed Marco Island development plan calls for the excavation of a large group of interconnected lakes near Marco Island, Florida. The quality of the proposed lakes is of considerable importance, both to the riparian owners and to the nearby estuarine areas that will receive surface discharges. The deep lakes will be stratified due to the influx of hypersaline ground water below a depth of 2.0 m. Density differences are so great across the chemocline that the possibility of overturn is nil. The lakes receive water from surface runoff from the various land uses; from inflow, from regional ground water flow in the shallow fresh water layer, and from direct rainfall. Water is lost by surface runoff, ground water outflows and evaporation. Annual precipitation in the area is about 50 inches. Residence times of 0.42 and 0.65 years have been calculated for two units of the development. On the basis of phosphorus loading rates, the lakes are expected to be mesotrophic with fair to good water quality. On the whole, predicted water quality is good with Secchi disk transparencies on the order of 1.2 to 1.5 m, and total nitrogen of about 1.3 mg/l. On the basis of nutrient loads, the urban development is expected to have little impact on the estuaries. (Moore-SRC)

TRIHALOMETHANE FORMATION IN NORTH CAROLINA DRINKING WATERS,

North Carolina Univ. at Chapel Hill. School of Public Health.
P. C. Singer, J. J. Barry, G. M. Palen, and A. E. Scrivner.
Journal of the American Water Works Association, Vol 73, No 8, p 392-401, August, 1981. 9 Fig, 9 Tab, 17 Ref.

Descriptors: *Potable water, *Trihalomethanes, Water pollution sources, Chlorination, Filtration, Water treatment facilities, Drinking water, Chlorine, Chloroform, *North Carolina.

A two year research project was initiated in September 1978 to assess trihalomethane (THM) formation in North Carolina drinking waters. The objectives of the study were: to analyze the quality

of raw and treated water at major water treatment facilities in North Carolina: to analyze data collected at these facilities by comparing THM concentrations with the 100 microg/liter standard, with organic carbon content, and with other physical and chemical water quality and treatment parameters to ascertain significant correlations between these parameters and THM formation: to perform laboratory treatability studies of methods for reducing and controlling THM formation at facilities not in compliance with the maximum contaminant level: and to use the results of the bench scale studies to recommend plant scale modifications to bring these plants into compliance. It was concluded that THMs were formed during the water treatment process at all locations. The average concentration in finished waters was 72 microg/liter and the median concentration was 58 microg/liter. Chloroform was the most predominant species. Raw water total organic carbon (TOC) and seven day chlorine demand correlated well with the THM formation potential of raw water and seemed useful as indicators of the THM concentration in finished water. THM concentrations increased during the course of treatment. Coagulation and settling and filtration reduced terminal THM concentrations an average of 42% and 54%, respectively. Both seasonal and temperature variations in THM formation were noted. A geographic distribution of THM formation and raw water TOC was noted. Elimination of prechlorination and applying chlorine during post-sedimentation or post-filtration reduced THM formation significantly. (Baker-FRC)

FATE OF DIFLUBENZURON IN WATER,

Science and Education Administration, College Station, TX. Veterinary Toxicology and Entomology Research Lab.
G. W. Ivie, D. L. Bull, and J. A. Veech.
Journal of Agricultural and Food Chemistry, Vol 28, No 2, p 330-337, 1980. 1 Fig, 5 Tab, 29 Ref.

Descriptors: *Diflubenzuron, *Insect control, *Insecticides, *Degradation, Fate of pollutants, Dimilin, Pesticides, Natural waters, Hydrogen ion concentration.

The insect growth regulator, diflubenzuron (Dimilin), at a concentration of 0.1 ppm had a half life of 7 days in distilled water (pH 6), and less than 3 days at pH 10.0; no degradation was observed even after 56 days at pH 4.0. Major degradation products were (4-chlorophenyl) urea and 2,6-difluorobenzoic acid, with small amounts of 2,6-difluorobenzamide and the quinazolinedione product. The use of diflubenzuron as an insect control agent should should not result in persistent residues in natural waters unless the water is quite acid. (Caesar-FRC)

TRANSPORT AND FATE OF SELECTED ORGANIC POLLUTANTS IN A SANDY SOIL,

Environmental Protection Agency, Ada, OK.
J. T. Wilson, C. G. Enfield, W. J. Dunlap, R. L. Cosby, and D. A. Foster.
Journal of Environmental Quality, Vol 10, No 4, p 501-506, October/December, 1981. 3 Fig, 4 Tab, 34 Ref.

Descriptors: *Chlorinated hydrocarbons, *Organic compounds, Fate of pollutants, Adsorption, Biodegradation, Degradation, Chloroform, Hydrocarbons, Solute transport, Path of pollutants, Organic matter, Sandy soils, *Groundwater pollution.

Organic compounds, chosen to represent serious groundwater pollutants, were applied to glass columns containing sandy soil profiles (low organic C, 0.087%). Water containing 1.0 or 0.2 mg per liter of the organic compound was applied at the rate of 14 cm per day for 45 days. Concentrations of compounds in the effluents and the amounts volatilized were determined and the mass balances calculated. Chemicals which percolated rapidly through the soil without degradation were chloroform, 1,2-dibromo-3-chloropropane, dichlorobromomethane, 1,2-dichloroethane, tetrachloroethene, 1,1,2-trichloroethane, and trichloroethene; retardation factors (velocity of tritiated water through the soil divided by the apparent velocity of pollutant through soil) were 2.5 or less. Little or no biodegradation was observed. From 19 to 65% of chemical applied to the surface reached the 140 cm depth, and the rest volatilized. Retardation of chlorinated benzenes generally increased with decreasing water solubility. Some degradation occurred in this group of compounds. Bis(2-chloroethyl) ether did not degrade, and its retardation factor was < 1.5. A method was developed to predict the retardation factors on the basis of water solubility of the chemical and soil organic C content. Soils containing low organic matter are more pollution-vulnerable. (Caesar-FRC)

PATHWAYS AND MECHANISMS FOR REMOVAL OF DISSOLVED ORGANIC CARBON FROM LEAF LEACHATE IN STREAMS,

Oregon State Univ., Corvallis. School of Oceanography.
C. N. Dahm.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, No 1, p 68-76, January, 1981. 4 Fig, 2 Tab, 30 Ref.

Descriptors: *Organic carbon, *Microbial degradation, *Adsorption, Organic matter, Clays, Iron oxide, Aluminum oxide, Leaves, Alder, Streams, Sediments, Degradation.

Leachate from alder (Alnus rubra) leaves was used to measure the removal of dissolved organic carbon (DOC) by adsorption and by microbial uptake. Over a 48-hour period 97% of added C14 labeled leachate was removed, 20% by adsorption and 77% by microbial utilization. Only a specific fraction of the DOC, probably containing specific chemical groups, was adsorbed. At pH 7 montmorillonite was the most adsorbent of the clay materials tested (0.8% of available DOC), followed by chlorite, 0.6%, and kaolinite, 0.5%. Fine detritus, thought to consist of uncrystallized aluminosilicate clays and hydrous oxides of Fe and Al, adsorbed 7.9 to 27.4%. Hydrous Al oxide alone removed 33% of the DOC, hydrous iron oxide, 26%, and montmorillonite clay prefused with amorphous iron, 26%. Adsorption by the organic fraction of the sediment was measured by treating leachate in chambers unpoisoned, poisoned with Hg2C12, and poisoned plus oxidation of organic matter. After 2 hours the DOC removals were 34, 25, and 21%, respectively. Although microbial uptake of DOC was kinetically slower (14 mg C per sq meter per hour), than adsorptive uptake, it was more effective over a longer period. (Caesar-FRC)

PHYSICAL AND GEOCHEMICAL CHARACTERISTICS OF SUSPENDED SOLIDS, WILTON CREEK, ONTARIO,

Queens Univ., Kingston (Ontario). Dept. of Geography.
E. D. Ongley, M. C. Bynoe, and J. B. Percival.
Canadian Journal of Earth Sciences, Vol 18, No 8, p 1365-1379, August, 1981. 9 Fig, 1 Tab, 65 Ref.

Descriptors: *Storm runoff, *Suspended solids, *Nutrients, Rural areas, Catchment areas, Seasonal variations, Metals, Particle size, Path of pollutants, *Wilton Creek, *Ontario.

Spatial and seasonal characteristics of suspended solids, phosphorus, and heavy metal associations were quantified in a study of stormflow events in a representative rural nonpoint source catchment of southeastern Ontario. The purpose of the study was to learn more about the principles of nutrient and contaminant transport in relatively uncontaminated fluvial systems. Field portable continuous flow centrifuge apparatus was used to collect bulk samples of subsieve solids. No significant spatial difference in physical or chemical properties of suspended solids was found between the four sample sites, which were located 1500-2000 m apart. There were profound seasonal shifts relating to hydrodynamic and biological factors. Particle-size distributions changed systematically throughout the year. Concentrations of P, Ca, and Mn increased in summer, while Al, Ti, Fe, and K peaked early in the year. (Small-FRC)

STREAM PHOSPHORUS EXPORTS FROM WATERSHEDS WITH CONTRASTING LAND USES IN SOUTHERN ONTARIO,

York Univ., Downsview (Ontario). Dept. of Geography.
A. R. Hill.
Water Resources Bulletin, Vol 17, No 4, p 627-634, August, 1981. 4 Fig, 3 Tab, 19 Ref.

Descriptors: *Phosphorus, *Land use, *Watersheds, Rivers, Agriculture, Topography, Wastewater, Environmental effects, Water quality, Duffin Creek basin, *Ontario.

Factors were analyzed which influence the concentration and loss of phosphorus from 22 watersheds within the Duffin Creek drainage basin. The roles of agriculture and urban land use were considered, as well as the influence of soil type and topographical characteristics. Over the 25 month period of the study, the annual average loss varied from 0.027 to 2.11 kg P/ha. Effluent from a sewage treatment plant contributed about 68% of the annual input of dissolved molybdate reactive phosphorus. There were also strong correlations with phosphorus content and crop areas and negative correlations with forests, abandoned farmland, and sandy loam soils. There was considerable retention of phosphorus in the stream channel, particularly during low summer flows. (Small-FRC)

MAJOR- AND TRACE-ELEMENT COMPOSITION OF SUSPENDED MATTER IN THE NORTH-EAST GULF OF ALASKA: RELATIONSHIPS WITH MAJOR SOURCES,

National Oceanic and Atmospheric Administration, Seattle, WA. Pacific Marine Environmental Lab.
R. A. Feely, and G. J. Massoth.
Marine Chemistry, Vol 10, No 5, p 431-453, 1981. 4 Fig, 6 Tab, 49 Ref.

Descriptors: *Suspended load, *Gulfs, *Gulf of Alaska, *Alaska, *Water pollution sources, Trace elements, Chemical analysis, Water analysis, Water currents, Copper River, Rivers, Streamflow, Aluminum, Copper, Calcium, Potassium, Manganese, Iron, Nickel, Zinc, Silicon, Calcium, Carbon, Nitrogen, Seasonal variation.

The spatial and temporal variations of major and trace elements associated with suspended matter from the north-east Gulf of Alaska are described with a view to understanding their relation to major sources. The north-east Gulf of Alaska is bordered by a mountainous coastline containing numerous glaciers, rivers, and streams which deliver large quantities of suspended material to the Gulf during the summer months when maximum discharge occurs. The major sediment dicharge is from the Copper River. Coastal circulation in the

gulf is dominated by the westward-flowing Alaska Current, which generally parallels the coastline. Particulate matter samples were collected from 51 stations in the north-east Gulf during each of three cruises. The results showed that suspended material from the Copper River and coastal streams was carried westward along the coast and deposited in nearshore environments. However, near Kayak Island, significant quantities of suspended material of terrestrial oigin were deflected to the southwest, past the edge of the outer shelf, by an anticyclonic gyre. The distribution patterns of the major and trace elements in the particulase matter and their elemental ratios with aluminum indicated that K, Ti, Mn, and Fe were primarily associated with aluminosilicate material, C and N with organic material, and Si, Ca, Cr, Ni, Cu and Zn with aluminosilicate material in near-shore surface and near-bottom samples and with organic material in offshore surface samples. Only C, N, Ca, Cu, and Zn showed significant seasonal variations which appeared related to biological production of organic matter. (Baker-FRC)

INCREASES IN SODIUM AND CHLORIDE IN THE MOHAWK RIVER, NEW YORK, FROM THE 1950'S TO THE 1970'S ATTRIBUTED TO ROAD SALT,

Geological Survey, Albany, NY.
N. E. Pet[illegible] and J. T. Turk.
Water R[illegible]es Bulletin, Vol 17, No 4, p 586-598, August, [illegible] 2 Fig, 6 Tab, 31 Ref.

Descriptors: *Sodium, *Chloride, *Deicers, Rivers, Water quality, *Water pollution sources, Salts, Ions, Chemical content, Mohawk River, New York, Roads, Road deicers.

A study to relate the chemical quality of the Mohawk River in 1951-53 and 1970-74 to chemical weathering rates within the basin was performed, using regression analysis of major ion concentrations. Sodium and chloride had consistently higher yields in kg/sq km/yr than other ions, although there was a 20% increase in all ions. The general increase in ion content was attributed to accelerated transport of ions out of the basin because of a 19% increase in stream discharge. Analysis of sources of sodium and chloride indicated that rock salt used as a deicer on roads may be a primary source. Transport rates of these chemicals have increased by 72% for sodium and 145% for chloride over the two decades studied. Forty percent of the sodium and 41% of the chloride was judged to result from rock salt use. Other major sources included natural weathering, domestic sewage, and atmospheric precipitation. NUTRIENT AND SEDIMENT LOADINGS FROM A SUBSURFACE DRAINAGE SYSTEM,

Florida Univ., Gainesville. Dept. of Agricultural Engineering.
A. B. Bottcher, E. J. Monke, and L. F. Huggins.
Transactions of the ASAE, Vol 24, No 5, p 1221-1226, September/October, 1981. 9 Fig, 4 Tab, 4 Ref.

Descriptors: Sediment load, *Subsurface drainage, Drainage, Groundwater movement, *Sediment transport, Drains, Water quality, *Nutrients, Sediments, Path of pollutants.

The overall water quality impact associated with the waters discharged from a subsurface drainage system on a field with minimum surface runoff was determined. The drainage system was installed in the early 1950's at a depth of 1 to 2 meters. The drain lines are clay tile with topsoil blinding except under observed wet spots, where stone envelopes exist. The system outlet was monitored for flow and water quality parameters using automatic sampling and recording equipment. Flow was determined by recording the depth of water behind a weir crest with a bubble-tube stage recorder. The majority of the subsurface drainage from the field occurred as the result of the winter moisture accumulation. Hydraulic conductivity of a soil profile might be increased by long term good soil management including subsurface drainage. Over 70% of the nitrogen lost in the drainage water was in nitrate form. About 70% of the phosphorus losses were in the form of sediment-bound phosphorus. Sediment, sediment-bound phosphorus and pesticides were all able to move through the soil profile, indicating the presence of direct flow channels. Heavy rainfalls occurring shortly after fertilizer application can greatly increase losses of both nitrogen and phosphorus through a subsurface drainage system. Better fertilization management can reduce the amount of soluble nutrients reaching tile drains. (Baker-FRC)

CHEMICAL AVAILABILITY OF CADMIUM IN MISSISSIPPI RIVER SEDIMENT,

Louisiana State Univ., Baton Rouge. Lab. for Wetland Soils and Sediments.
R. A. Khalid, R. P. Gambrell, and W. H. Patrick, Jr.
Journal of Environmental Quality, Vol 10, No 4, p 523-528, October/December, 1981. 4 Fig, 2 Tab, 35 Ref.

Descriptors: *Cadmium, *Oxidation-reduction potential, *Hydrogen ion concentration, *Dredging, *Sediments, Fate of pollutants, Water pollution sources, *Mississippi River, Chelation, Chemical reactions, Food chains, Organic matter, Sulfides.

The distribution of Cd among various chemical forms (water-soluble, exchangeable, reducible, DTPA-extractable or chelated, and insoluble organic-bound) at different pH and redox potentials (Eh) were studied in the laboratory using Mississippi River sediments. The sediment suspensions, spiked with 0.2 micro Ci Cd109 per g solids, were incubated at 4 redox poential levels from strongly reduced to well-oxidized (-150, +50, +250, and +500 mV) at each of 3 pH levels (5.0, 6.5, and 8.9). Water soluble Cd109 generally increased with pH decreases, especially in the +250 and +500 treatments, and was little changed by Eh changes at neutral or alkaline pH. Exchangeable Cd109 levels increased with Eh from 2.0 to 57.5% at pH 5.0 and from 1.3 to 20.6% at pH 6.5. At pH 8.0 the Cd109 varied from 1.5 to 3.5%. The reducible fraction (adsorbed on Fe/Mn hydrous oxides) ranged from 6.4 to 21.6% of added Cd109 and was not significantly affected by pH or Eh changes. Cd109 levels in the chelated fraction were 12.9-18.2% at pH 8.0, 10.8-23.6% at pH 6.5, increasing with Eh, and 10.9-20.6% at pH 5.0, showing no trend. Insoluble organic bound Cd109 was highest at strongly reduced sediment conditions and decreased with increased oxidation at all pH levels. Disposal of dredged material containing Cd in open water would not release much Cd to the water under the typical very reduced, alkaline to neutral conditions. However, Cd could be readily mobilized from dredged material dumped on land high in organic matter or sulfides. Reduced sulfide-rich sediments exposed to air oxidize to sulfuric acid, producing pH levels as low as 2 to 4, and releasing Cd to runoff, groundwater, and the food chain. (Cassar-FRC)

NITRATE-NITROGEN IN TILE DRAINAGE AS AFFECTED BY FERTILIZATION,

Iowa State Univ., Ames. Dept. of Agricultural Engineering.
J. L. Baker, and H. P. Johnson.
Journal of Environmental Quality, Vol 10, No 4, p 519-522, October/December, 1981. 2 Fig, 3 Tab, 24 Ref.

Descriptors: *Fertilizers, *Nitrates, *Tile drainage, Nutrients, Nitrogen compounds, Corn, Soybeans, Oats, Agriculture, Drainage effects, Leaching, Water quality, Water pollution sources, Fate of pollutants, Agricultural runoff.

Tile-drained corn fields in Iowa lost significant nitrate-N to streamflows under moderate and high fertilizer applications. In a before and after study, the two plots, grown to corn in rotation with oats or soybeans, received 112 kg N per ha in 1970 and again in 1972 (first phase). In the second phase one plot received 100 kg N per ha in 1974 and 90 kg per ha in 1976; the second plot, 250 kg per ha in 1974 and 240 kg per ha in 1976. In 1978 both plots were fertilized with 90 kg N per ha. Nitrate-N levels in drainage water samples from the higher fertility plot exceeded those from the lower fertility plot by two fold in 1974 and four fold in 1976. There was a 2-month lag after fertilizer application before the excess N appeared in the tile drainage water. Even 3 years after the last differential fertilizer application the higher fertility plot was contributing more N to drainage waters than the lower fertility plot. The low fertility plot drainage water averaged concentrations of 20 micrograms per ml for a total loss of 27 kg N per ha; the higher fertility plot, 40 micrograms per ml concentration and 48 kg N per ha total loss. Heavy rains caused temporary high concentrations (up to 92 micrograms per ml) of nitrate-N in drainage waters. (Cassar-FRC)

CONTINUOUS SIMULATION OF RECEIVING WATER QUALITY TRANSIENTS,

Duke Univ., Durham, NC. Dept. of Civil Engineering.
M. A. Medina, Jr., and J. Buzun.
Water Resources Bulletin, Vol 17, No 4, p 549-557, August, 1981. 10 Fig, 2 Tab. 19 Ref.

Descriptors: *Mathematical models, *Urban runoff, *Biochemical oxygen demand, *Dissolved oxygen, Runoff, *Water quality, Storm water, Water pollution sources.

A continuous simulation model was derived which solves the one-dimensional transient conservation of mass equations for coupled biochemical oxygen demand-dissolved oxygen reactions for urban stormwater runoff. The solution is based on the principle of superposition for continuously discharging plane sources. The model permits the derivation of water quality frequency curves and frequency histograms of consecutive hourly dissolved oxygen violations at any set standard. The scheme is applied to the Des Moines River to determine the urban storm impacts of Des Moines, Iowa. Urban stormwater impacts can be masked by the cumulative frequency curve representation, but the frequency histograms clearly showed the duration of consecutive water quality standard violations. The application also revealed the inadequacy of fixed magnitude water quality standards. Most waste allocation studies are based on arbitrary (7-day, 10-year low flow) conditions, and the probability of occurrence cannot be established. (Small-FRC)

THE SUSPENDED SEDIMENT-WATER PARTITIONING COEFFICIENT FOR KEPONE IN THE JAMES RIVER, VIRGINIA,

William and Mary Coll., Gloucester Point, VA. Inst. of Marine Science.
C. J. Strobel, R. E. Croonenberghs, and R. J. Huggett.
Environmental Pollution, Series B, Vol 2, No 5, p 367-372, 1981. 1 Fig, 4 Tab, 9 Ref.

Descriptors: *Suspended sediments, Rivers, *Kepone, *James River, Pesticides, Pollutants, Contamination, Storm surges, Storm tides, Waves, Water pollution control, Monitoring, Virginia.

Attempts were made to verify, in the field, laboratory estimates of the suspended sediment-water partitioning coefficient for Kepone. Attempts were also made to determine the effect of tropical storm David on this value. Surface water samples were collected on September 4, 6, and 12 at three stations on the James River, Virginia. Two samples were obtained from each station on each sampling date at about 1 hr before low tide. No significant differences in calculated partitioning coefficients were found between stations or between dates. The concentration of Kepone dissolved in the water was not significantly different before and after storm David. Salinity decreased after the storm and remained depressed for at least a week. The concentration of suspended sediment in the water increased significantly after the storm at two stations and decreased at the third. The three stations chosen for the study represent different degrees of

sediment loading. The rapid equilibration of Kepone between water and suspended sediment suggests that the major impact on Kepone movement from a storm might lie in the physical movement of sediments and water, without changes in their respective Kepone concentrations. (Baker-FRC)

HEAVY METALS IN RIVER SEDIMENTS - CALCULATION OF METAL ADSORPTION MAXIMA USING LANGMUIR AND FREUNDLICH ISOTHERMS,

Sheffield Univ. (England). Dept. of Microbiology.
J. E. Dudderidge, and M. Wainwright.
Environmental Pollution, Series B, Vol 2, No 5, p 387-397, 1981. 6 Tab, 14 Ref.

Descriptors: *Sediments, *Heavy metals, Metals, Rivers, Adsorption, Isotherms, Chemical analysis, England, Path of pollutants, *Bottom sediments.

The use of various extractants to determine the concentrations of biologically available heavy metals in diverse river sediments is reported. Whether heavy metal adsorption to these sediments can be adequately described using Langmuir and Freundlich isotherms was also investigated. Four English rivers, the Lathkill, Wye, Swale and the Porter Brook, were chosen for the study. At each site several river sediment cores were collected randomly at a water depth of more than 0.5 meters. River water samples were also collected. The pH of the sediments was near neutrality, ranging from pH 6.8 for the River Swale to pH 7.4 for the River Wye. The top 1.5 cm of sediments were oxidizing. The particle size distribution of the sediments showed that the River Swale and Porter Brook sediments were predominantly sandy in texture. The River Lathkill and River Sye sediments tended toward a silt and clay texture, reflecting the superficial deposits over which they flow. A relatively low concentration of metal was found in the river water samples, compared to the sediment samples. Less than 10% of the total metal concentration was extractable by extractants used to predict plant uptake of these elements from soils. The most effective extractant was EDTA, followed by ammonium acetate, while distilled water proved inefficient. In the majority of cases the adsorption of heavy metals to the sediments fitted the Langmuir isotherm or, where they did not, the results fitted a Freundlich isotherm. (Baker-FRC)

THE EARLY DIAGENESIS OF ALIPHATIC HYDROCARBONS AND ORGANIC MATTER IN SEDIMENTARY PARTICULATES FROM DABOB BAY, WASHINGTON,

Washington Univ., Seattle. Dept. of Oceanography.
F. G. Prahl, J. T. Bennett, and R. Carpenter.
Geochimica et Cosmochimica Acta, Vol 44, No 12, p 1967-1976, 1980. 3 Fig, 3 Tab, 37 Ref.

Descriptors: *Sediments, *Hydrocarbons, Aliphatic hydrocarbons, *Dabob Bay, *Washington, Estuarine environment, *Estuaries, Sediment-water interfaces, Interfaces, Plankton.

Results are presented of analyses of aliphatic hydrocarbon compositions and bulk organic matter in sediment trap-collected particulate material and bottom sediments from Dabob Bay, Washington. High resolution glass capillary gas chromatography was used in the analysis. A comparison was made between the average net accumulation of individual hydrocarbons measured in a 1 year series of sediment traps and the net accumulation of corresponding compounds measured in three depth intervals of Pb-210 dated bottom samples. The net accumulation of individual hydrocarbons registered systematic and rapid decreases from the sediment traps to the sediments. The most pronounced decreases were noted for planktonically derived hydrocarbon constituents such as pristane and two unsaturated compounds which were rapidly remineralized at or near the sediment-water interface. It was concluded that the amount of each compound as measured in deposited sediments is not necessarily a quantitative indication of its initial flux to the sediments. The hydrocarbons of terrestrial plant wax origin were the predominant ones measured by the 4-6 cm depth in these sediments, and they demonstrated a reasonably constant net accumulation below this interval. Diagenetic alteration of the bulk organic matter contained in the average sediment trap particulate material was noted through comparison with bottom sediments. Organic matter elementally similar to marine plankton was preferentially remineralized on deposition of the sedimentary particulates. The organic matter remaining and buried in the bottom sediments closely resembled terrestrial organic matter. (Baker-FRC)

PERMETHRIN CONCENTRATION ON COTTON PLANTS, PERSISTENCE IN SOIL, AND LOSS IN RUNOFF,

Science and Education Administration, Baton Rouge, LA.
B. R. Carroll, G. H. Willis, and J. B. Graves.
Journal of Environmental Quality, Vol 10, No 4, p 497-500, October/December, 1981. 4 Tab, 14 Ref.

Descriptors: *Insecticides, *Permethrin, *Runoff, Fate of pollutants, Pesticide residues, Cotton, Degradation, Agricultural runoff.

The synthetic pyrethroid insecticide permethrin, applied to cotton plants at the rate of 0.112 kg per ha on 10 days during August and September 1976 and 1977, did not appear in runoff in concentrations of more than 0.20 ppg in 1976. However, in 1977, a high rainfall year, 3 of 28 runoff samples contained over the 0.39 ppb LC50 value for crawfish (3.5, 1.9, and 0.44 ppb). Most other samples collected in 1977 remained below the 1 ppb level. Analysis of cis and trans isomers on plants and leaf litter and in soil and runoff indicated that permethrin disappeared within 3-6 months after the last application. Although the ratio of cis to trans isomer was near unity in the applied insecticide and on the plants and leaf litter, there was a higher proportion of cis isomer in the soil. Even under severe runoff conditions, permethrin is not likely to be harmful to aquatic species. (Cassar-FRC)

COMPARATIVE UPTAKE OF ACTINIDES BY PLANTS AND RATS FROM THE SHORELINE OF A RADIOACTIVE POND,

Oak Ridge National Lab., TN. Environmental Science Div.
C. T. Garten, Jr.
Journal of Environmental Quality, Vol 10, No 4, p 487-491, October/December, 1981. 4 Tab, 22 Ref.

Descriptors: *Radioactive wastes, *Bioaccumulation, *Food chains, Plutonium, Americium, Uranium, Curium, *Fate of pollutants, Aquatic plants, Rats, Accumulation, Sediments.

Relative uptakes of actinides by plants and rats from the shoreline of a former low-level liquid radioactive waste pond were Pu < Am < or = Cm < U233 = U238. Analyses of emergent macrophytes (Eliocharis and others), rat carcasses and gastrointestinal tracts, and shoreline sediments indicated that shoreline plants contained 2-150 times the actinide concentrations of fescue collected at the top of the bank. The ranges of actinide levels (in fCi per g dry weight) were: plants, 4.1-1311; rat carcasses, 1.2-71; rat gastrointestinal tracts, 18-35510; and shoreline sediment, 4100-869,400. From a comparison of plant/sediment, rat carcass/sediment, and rat carcass/plant concentration ratios, the relative uptakes listed above were inferred. Sediment leachability studies and patterns of uptake by plants and rats indicate that the valence states of the actinides at this site are Pu(4+), Am(3+), Cm(3+), and U(6+). (Cassar-FRC)

SPATIAL AND TEMPORAL VARIATION OF FECAL COLIFORM MOVEMENT SURROUNDING SEPTIC TANK-SOIL ABSORPTION SYSTEMS IN TWO ATLANTIC COASTAL PLAIN SOILS,

Virginia Polytechnic Inst. and State Univ., Blacksburg.
L. W. Stewart, and R. B. Reneau, Jr.
Journal of Environmental Quality, Vol 10, No 4, p 528-531, October/December, 1981. 4 Fig, 1 Tab, 14 Ref.

Descriptors: *Septic tanks, *Soil absorption capacity, *Water table gradient, *Path of pollutants, Coliforms, Effluents, Drainage, Wastewater treatment, Coastal plains, Bacteria, Soil disposal fields.

Locating conventional septic tank-soil absorption systems in high-water-table soils may produce shallow groundwater pollution. The movement of fecal coliforms was studied at two private sites in Chesapeake, Virginia, elevated 5 and 6.7 meters above sea level in loamy, mixed thermic Typic Ochraquults, one fine and one coarse. Monitoring wells were at 152 cm (shallow) and 305 cm (deep). Sampling was done every 2 or 3 weeks from January 1977 to September 1979. This site with a nearby drainage ditch (water table gradient 3.2%) showed fecal coliform movement in a predominantly horizontal direction. Shallow well lognormal coliform levels were 340 MPN per 100 ml, and deep well levels, < 3 per 100 ml. The second site, with poor drainage, had lognormal fecal coliform densities of 25-150 per 100 ml in the shallow wells and 10 per 100 ml in the deep wells. These values indicate a greater vertical movement of effluent at the second site. Coliform counts in wells varied widely through the year, being low when the water table level was below the drain field (August-December) and high the rest of the year. Nonuniform distribution of effluent was seen in soils at both locations. (Cassar-FRC)

EVALUATION OF WATER QUALITY DURING HERBICIDE APPLICATIONS TO KERR LAKE, OK,

Oklahoma Water Resources Board, Oklahoma City. Water Quality Div.
K. Morris, and R. Jarman.
Journal of Aquatic Plant Management, Vol 19, p 15-18, July, 1981. 1 Fig, 1 Tab, 7 Ref.

Descriptors: *Herbicides, *Water quality standards, *Aquatic weed control, Weed control, Nutrients, 2,4-D, Ammonia, Phosphorus, Nitrogen, *Fate of pollutants, Reservoirs, Kerr Lake, Oklahoma, Monitoring.

State water quality standards were not violated during herbicide treatment of Eurasian watermilfoil in the Robert S. Kerr Reservoir, Oklahoma, during 1977 and 1978. In 1977 five sites were treated (158.1 ha) with the butoxyethanol ester of 2,4-dichlorophenoxy acetic acid (2,4-D BEE). In 39 water samples analyzed, the herbicide was detected only once in the Little Sans Bois Creek area. However, nutrient levels were significantly increased. The 1978 program involved treatment of 463.3 ha of water with 4218 kg of granular 2,4-D BEE in June and 3833 kg applied to 202.6 ha in August. Water quality monitoring of 809 water samples resulted in herbicide detection (3 micrograms per liter) 4 hours after treatment at one site.

This is far less than the 100 micrograms per liter standard. No 2,4-dichlorophenol, a by-product, was detected in samples. There were statistically significant increases in total P at three sites and a decrease in ammonia at one site. (Cassar-FRC)
W82-02327

RELATIONSHIPS BETWEEN POND SEDIMENTS AND SIMAZINE LOSS FROM WATERS OF LABORATORY SYSTEMS,

Delta Experiment Station, Stoneville, MS.
C. S. Tucker, and C. E. Boyd.
Journal of Aquatic Plant Management, Vol 19, p 55-57, July, 1981. 2 Tab, 14 Ref.

Descriptors: *Herbicides, *Aquatic weed control, *Degradation, *Simazine, Weed control, Fate of pollutants, Sediments, Ponds, Adsorption, Sinks.

Pond sediments were the major sink for simazine applied to fish ponds. In flasks containing pond water alone, 20% of the simazine was lost from the water 32 days after application; in water-sediment systems, 75%. Organic content was positively correlated and pH was negatively correlated with the rate of simazine disappearance. Simazine half-lives for sediments containing < 0.5% organic matter and 15-30% clays were 61.2-72.5 days; for soils with 8.7-9.0% organic matter and 26-37% clay, 7.8-7.9 days. Soils with intermediate amount of organic matter had simazine half lives of 10.8-43.4 days. There were 16 samples of sediment investigated. (Cassar-FRC)

SUMMER INTERNAL PHOSPHORUS SUPPLIES IN SHAGAWA LAKE, MINNESOTA,

Corvallis Environmental Protection Agency, OH.
D. P. Larsen, D. W. Schults, and K. W. Malueg.
Limnology and Oceanography, Vol 26, No 4, p 740-753, July, 1981. 5 Fig, 7 Tab, 50 Ref.

Descriptors: *Phosphorus, *Lake sediments, *Eutrophication, Fate of pollutants, Water pollution effects, Water pollution control, Tertiary wastewater treatment, Sediments, Glacial lakes, Lakes, *Shagawa Lake, *Minnesota, Anaerobic conditions.

Installation of a tertiary wastewater treatment plant at Ely, Minnesota, in 1973 was expected to reduce mean P concentration in Lake Sagawa, a small, shallow, soft water glacial forest lake. Although wastewater P loading was reduced by 99% and loading from all external sources by 80%, the lake continues to be highly productive, especially during July and August. The source of P was internal, corresponding to internal supply rates of 240-680 kg per week over a 3-9 week interval in summer. The P release took place during anaerobic conditions, the time of which varied from year to year (1971-1975). The P content of the surface sediments was 0.2-0.5% dry weight, and a large proportion was potentially mobile, 27.7 to 72.8% (NaOH extractable). The upper 10 cm of sediments was estimated to contain 50,000 kg of potentially mobile P, enough to supply P to lake water for about 20 years at the present release rate. (Cassar-FRC)

SOURCE AND EXTENT OF KLEBSIELLA PNEUMONIAE IN THE PAPER INDUSTRY,

Wisconsin Univ.-Madison. Dept. of Veterinary Science.
N. R. Caplenas, M. S. Kanarek, and A. P. Dufour.
Applied and Environmental Microbiology, Vol 42, No 5, p 779-785, November, 1981. 3 Fig, 3 Tab, 14 Ref.

Descriptors: *Bacteria, *Pulp and paper industry, *Wastewater analysis, Fate of pollutants, Water pollution sources, Coliforms, Klebsiella pneumoniae, Water reuse, Wastewater treatment, Water quality, Effluents.

The fates of fecal coliform and Klebsiella pneumoniae, an opportunistic pathogen, were traced through the pulp and paper manufacturing process. Fresh water used in 3 types of mills (groundwood pulp, sulfite pulp and fine paper, and drinking pulp and fine paper) contained up to 490 per 100 ml fecal coliforms and < 10 per 100 ml total K. pneumoniae. Bacterial concentrations were high throughout the pulping process and increased during water recycling, up to 3 million total K. pneumoniae per 100 ml. Although wastewater treatment produced some reduction in total fecal coliforms in some samples, total K. pneumoniae, especially the thermotolerant type, was little affected. The paper industry is a source of pathogens, both within the plant and in the receiving waters. (Cassar-FRC)

SIMULATION OF NUTRIENT BALANCES IN A SHALLOW AND POLLUTED RIVER: A STRATEGY FOR ENVIRONMENTAL CONTROL,

Osaka Univ. (Japan). Dept. of Fermentation Technology.
S. Aiba, and H. Ohtake.
Annals of the New York Academy of Sciences, Vol 369, p 219-233, 1981. 9 Fig, 22 Ref.

Descriptors: *Simulation, *Nutrients, Cycling nutrients, Rivers, *Environmental control, Dissolved oxygen, Biological oxygen demand, Phosphorus, Phosphates, Enrichment, Eutrophication.

A model developed for simulation of biological oxygen demand, dissolved oxygen and phosphate-phosphorus in a shallow river (Tama-gawa) demonstrates the significant role of periphytic algae in the nutrient balance. This role of periphytic algae is significant not only in shallow rivers, but also in polluted ones. Phosphorus fixed by algal photosynthesis and that precipitated onto the river bottom amounted in total to about 38% of the daily input of phosphorus to the water body. The algal growth was inevitably accompanied by secondary biological oxygen demand (BOD) loading. About 35% of the daily input of BOD into the river originated from algal decay. It was concluded that increasing the water quantity was effective in greatly improving the water quality, but that inflow of nutrients from tributaries was the main cause of the progressive enrichment in the selected example. The new procedure used in this study to solve the partial differential equations appearing in the one dimensional model was more advisable than either the multi-step or the conventional implicit procedures used in earlier studies, as it minimized the computation time while guaranteeing good accuracy. FATE AND EFFECTS OF A HEAVY FUEL OIL SPILL ON A GEORGIA SALT MARSH,

Skidaway Inst. of Oceanography, Savannah, GA.
R. F. Lee, B. Dornseif, F. Gonsoulin, K. Tenore, and R. Hanson.
Marine Environmental Research, Vol 5, No 2, p 125-143, 1981. 11 Fig, 1 Tab, 30 Ref.

Descriptors: *Salt marshes, *Oil spills, Tidal marshes, Fate of pollutants, Aquatic life, *Water pollution effects, Oily waters, Sediments, Oysters, Periwinkle, Snails, *Georgia.

On November 13, 1978, 40 gal of a No. 5 fuel oil were added to 1 acre of a Spartina alterniflora salt marsh bordering the Wilmington River in Georgia. Fluoranthene, phenanthrene, and chrysene were dissolved in the fuel oil before the oil was added to the marsh. On December 5, 1978, an additional 20 gal of the fuel oil were added to a 10 meter by 3 meter section within the previously oiled area. The oil was sprayed on the surface of the marsh at low tide. Animals were collected at various times after the oil additions and analyzed for polycyclic aromatic hydrocarbons by high pressure liquid chromatography. The marsh sediment consisted of 61% sand, 12% silt, and 26% clay. The highest concentrations of phenanthrene, chyrsene and fluoranthene in the sediment were 112, 105 and 75 ng/g sediment, respectively. These concentrations decreased rapidly during the 20 week period after the spill. The times for these hydrocarbons to decrease to 50% their original concentration were about 100, 70, and 30 days in sediment, mussels, and oysters, respectively. Benthic macrofauna species showed no chage in some cases, and in others either an increase or decrease in population. No changes were noted in populations of fiddler crabs, oysters, or mussels. Mud snails increased in density after the spill due to immigration of adult snails from untreated areas to scavenge on animals killed by the oil. Many of the adult periwinkles were killed by the oil. In the spring, juvenile periwinkles recolonized to oil areas as a result of larvae settling. (Baker-FRC)

KEPONE DISTRIBUTION IN THE WATER COLUMN OF THE JAMES RIVER ESTUARY - 1976-78,

Virginia State Water Control Board, Richmond. Div. of Ecological Studies.
C. A. Lunsford.
Pesticides Monitoring Journal, Vol 14, No 4, p 119-124, March, 1981. 1 Fig, 4 Tab, 16 Ref.

Descriptors: *Organic pesticides, Rivers, *Kepone, *James River, Organic compounds, Pesticides, Sediments, Stratification, Thermal stratification, Temperature effects, Estuaries, Coastal waters, Virginia.

The results of Kepone water column monitoring in the James River estuary during the period 1976-1978 are reported. The James River discharges at an average rate of 212 cubic meters per second. Samples were collected quarterly at 75 stations from four areas of the estuary. The analysis of kepone residues showed a range of concentrations from 0 to 1.20 ppb. Concentrations in James River sediment samples ranged from 0 to 5 ppm. Differences in kepone concentrations at the surface and at the bottom of the water column were not significant. Concentrations were highest during July through September. It was felt that temperature may affect the partition coefficient of kepone in water/sediments. The peak in kepone concentrations may be due to increased numbers of phytoplankton in the water column. These summer increases may require imposing restrictions on summer dredging in kepone contaminated areas of the estuary. Spatial variations in water column residue concentrations were also noted, with residues averaging higher in the middle reach of the estuary. It is urged that future studies include investigations of dissolved and suspended solids phases of kepone in the water column. (Baker-FRC)

SOURCES OF TWELVE TRACE METALS IN ANTARCTIC SNOWS DETERMINED BY PRINCIPAL COMPONENT ANALYSIS,

Centre National de la Recherche Scientifique, Grenoble (France). Lab. de Glaciologie.
C. Boutron, and S. Martin.
Journal of Geophysical Research, Vol 85, No C10, p 5631-5638, October, 1980. 5 Fig, 4 Tab, 26 Ref.

Descriptors: *Trace metals, *Snow, *Aerosols, Air pollution, Statistical analysis, Snow sampling, Water pollution sources, *Antarctic.

Sources of Antarctic aerosols were investigated by a statistical analysis of the trace metals concentrations measured in the snow layers deposited at various sites of the ice cap. The method used was principal components factor analysis of the observed temporal and geographical variations of the measured concentrations. Two hundred and fifty surface snow samples were collected for trace metal analysis, and 12 elements were determined (Na, Mg, K, Ca, Fe, Al, Mn, Pb, Cd, Cu, Zn, and Ag). Typically, three areas were delimited accord-

ing to the observed variations. The first one was near the coast (5-35 km), the second 43-173 km, and the last one at 173-1070 km. Some trace metals have an oceanic source, while others may have a crustal continental source (Al, Fe, and Mn). This technique should be applied to larger set of data, including concentrations data for numerous other elements. When method results are proven, they can be used in mathematical models. (Small-FRC)

A STUDY ON THE ACCUMULATION OF COPPER AND ZINC IN THE MID-GUT GLAND OF CULTURED SCALLOP FOR ENVIRONMENTAL MONITORING, (IN JAPANESE),

Iwate Univ., Morioka (Japan). Div. of Forestry and Fishery.
S. Kamimura.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 10, p 1245-1248, October, 1980. 4 Fig, 3 Tab, 6 Ref. (English summary).

Descriptors: *Bioaccumulation, *Copper, *Zinc, Mollusks, Marine animals, Bioindicators, *Scallop, Accumulation, Heavy metals, Monitoring, Mathematical studies, Statistical analysis.

A statistical analysis of the accumulation profiles of copper and zinc in the mid-gut glands of cultured scallops was performed to determine their ambient levels. The levels of both copper and zinc in the gland were found to increase as the organ weight increased. A linear relationship between copper and zinc levels and organ weight was observed. The coefficient of the correlation was characteristic for the ambient level. The analysis confirmed the usefulness of the profile analysis of the heavy metals accumulation in the mid-gut gland for estimating the trend of their levels in the environment. This study also indicated that cultured scallops could be a suitable indicator organism for use in environmental monitoring. (Carroll-FRC)

ACCUMULATION OF HEAVY METALS IN ARID-ZONE SOILS IRRIGATED WITH TREATED SEWAGE EFFLUENTS AND THEIR UPTAKE BY RHODES GRASS,

Hebrew Univ., Rehovot (Israel). Dept. of Soil and Water Sciences.
A. Banin, J. Navrot, Y. Noi, and D. Yoles.
Journal of Environmental Quality, Vol 10, No 4, p 536-540, October/December, 1981. 2 Fig, 6 Tab, 22 Ref.

Descriptors: *Heavy metals, *Irrigation water, *Wastewater irrigation, Impaired water use, Metals, Rhodes grass, Grasses, Sprinkler irrigation, Secondary wastewater, Clays, *Soil chemistry, Fate of pollutants, Cadmium, Chromium, Lead, Zinc, Copper, Nickel.

Heavy metal accumulation was determined in soils of commercial fields of Rhodes grass with 12 to 28 year histories of sewage effluent irrigation. Plots in three soils (a loamy sand, a sandy loam, and a clay loam) were irrigated with sewage effluent or tap water at the rate of 7000-8000 cu meters per ha per year. There were no statistically significant differences in levels of Cr or Zn in all soils and in both treatments. Cd levels were significantly higher than in controls in all three soils. Cu, Ni, and Pb levels were higher than controls in the clay soils. Concentrations of available or acid-extractable metals were generally higher (except for Cr) in effluent-irrigated fields than in tap water-irrigated fields. Rhodes grass samples grown in effluent-treated soils were higher in metals (except for Cr) than tap water-treated crops. As the surface area (or clay content) of the soil increased, the enrichment factor (micrograms element per g plant/micrograms element per g soil) increased, being more pronounced with the more labile metals, Cd, Cu, and Ni. The relative magnitude of the enrichment factor was Cu > Cd > Pb > Ni > or = Cr. This relationship depends on the solubility in water, which is in turn dependent on ionic potential. (Cassar-FRC)

CHARACTERIZATION OF OIL SPILLS ON INLAND AND ESTUARINE WATERS,

North West Water Authority, Warrington (England).
P. J. Whittle, and M. W. Horne.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 1, p 50-60, January, 1980. 8 Fig, 3 Tab, 2 Ref.

Descriptors: *Oil spills, *Chemical analysis, *Oil-water interfaces, *Oil pollution, *Tracers, Estuaries, Streams, Gas chromatography, Hydrocarbons, Dyes, Fuel, Laboratories, Dye concentrations, Reservoirs.

The techniques used in the analysis of polluting oils are discussed. Capillary chromatographic columns have been used to advantage, and may increase in efficiency with future developments. If inorganic based phases are developed, this technology coupled with mass spectrometry would provide an improved method of analysis. Infra-red spectrometry has limited application. Other techniques will include the quantitative detection of other elements present in the oil by means of plasma source spectrometry. Future advances will include microprocessed controlled instrumentation and data-handling systems. Chromatographic analysis of an oil of unknown origin which entered a reservoir via a feeder stream after a heavy rain revealed a peak corresponding to cis-cis double bonds, found in rubber. A search of the source area revealed old quarry workings in which an estimated 60,000 tons of used tires had been dumped and burned. Since the pollution incident about 85,000 gallons of oil have been removed from this reservoir, but heavy rain still occasionally washes out more oil from underground. (Titus-FRC)

THE IMPACT OF URBANIZATION ON SEASONAL HYDROLOGIC AND NUTRIENT BUDGETS OF A SMALL NORTH AMERICAN WATERSHED,

Wisconsin Univ.-Madison. Inst. of Environmental Studies.
V. J. Watson, O. L. Loucks, and W. Wojner.
Hydrobiologia, Vol 77, No 1, p 87-96, 1981. 2 Fig, 5 Tab, 16 Ref.

Descriptors: *Nutrients, *Hydrologic budget, *Urbanization, Fate of pollutants, Lakes, Water quality control, Phosphorus, Nitrogen, Runoff, Seasonal variation, *Lake Wingra, *Wisconsin, Small watersheds, Watersheds, Lake morphometry.

The effects of urbanization on the nutrient, and hydrologic budgets of Lake Wingra, a small shallow lake in Madison, Wisconsin, was determined by comparing seasonal water inputs, nutrient yields, and N:P ratios before and after urbanization. Seepage contributes 69% of the water inpuet to the lake. The total hydrologic budget and the springs and groundwater and the rainfall components of the budget were similar for pre- and post-settlement eras. However, in pre-settlement times spring runoff was 85% of total runoff and summer runoff, 0.58%. Modern runoff is 48% in spring, 20% in summer. Most of the N input to the lake is from the groundwater, 68% pre-settlement and 60% present; from runoff, 10% presettlement and 17% present. Most of the P input is from runoff, 42% pre-settlement and 71% present. This increase in runoff with resultant decreases in evapotranspiration and subsurface flow has increased annual P loadings (680 to 1000 kg P) and decreased the N:P ratio of total loading (40 to 26, a 35% change). The annual N budget did not change significantly, 27,000 kg N in pre-settlement times and 26,000 kg N in the present. The pre-settlement lake area was 1.75 times the present area and the volume was 1.5 times the present volume. These changes, produced by dredging, filling and damming, contributed substantially to the increased concentration of nutrients. Water quality control measures suggested are: (1) concentrate on reducing P in runoff in spring and summer by diversion of runoff into marshes not bordering lakes or into detention ponds, and (2) minimize lake modifications which reduce water volume. DENMARK'S STATE OF THE ENVIRONMENT,

B. Wilder.
Ambio, Vol 9, No 2, p 104-106, 1980. 3 Fig, 3 Ref.

Descriptors: *Water quality, *Water pollution control, *Denmark, Reviews, Mercury, Heavy metals, Streams, Seas, Coastal waters, Recreation demand.

The degree of improvement in environmental conditions in Denmark since the passage of the 1974 Environmental Protection Act was investigated. Denmark has vast quantities of clean groundwater as a resource, but a number of potential threats to its clean condition exist. Characteristics of seepage and underground waterflow tend to cloud future predictions, as the effects of surface pollution may not appear in groundwater for decades. Improvement has been noted in the quality of Denmark's lakes and streams. In spite of confusing factors of crop watering, silage disposal and contamination by pesticides and ochre, the Danish streams were rated cleaner than they had been 10 years ago. Seas and coastal areas around Denmark have been threatened by sewage and oil spills. The mercury load is particularly high in certain areas. In the open seas precipitation is the major source of heavy metal pollution. The quality of the water for recreational purposes has improved. (Baker-FRC)

ESTUARINE AND MARINE COASTAL POLLUTION IN THE REPUBLIC OF IRELAND,

University Coll., Cork (Ireland). Dept. of Zoology.
A. Myers.
Marine Pollution Bulletin, Vol 12, No 8, p 260-264, August, 1981. 1 Fig, 3 Tab.

Descriptors: *Reviews, *Ireland, *Estuaries, Coasts, Fisheries, Cork Harbour, Bantry Bay, Harbors, Bays, *Industrial wastes, Environmental protection, Coastal waters, *Water pollution sources.

Industrial development in Ireland has been concentrated in the vicinity of coastal towns, where almost one half of the population resides. The increase in population plus industry in coastal towns has escalated the volume of waste materials entering Irish coastal waters. The volume of waste materials entering Irish coastal waters has been estimated to be increasing at about 10% per year. Much of the recent work in pollution of waters has been centered around assessment in organisms of heavy metals, organic poisons, sewage, and radioactive materials. A multivariate approach has been carried out in studies at Trinity College to study intertidal and peritidal zones of east coast estuaries. Particular emphasis is placed on eutrophication by phosphorus and nitrogen, the addition of organic matter including hydrocarbons, and the distribution of heavy metals. Pollution in Cork Harbour, an area undergoing rapid industrial development, has also been the object of several studies. Possible effects of an oil transhipment terminal in Bantry Bay have been considered. Pollution research with an emphasis on marine studies at the universities has largely been funded on an ad hoc basis from national funds, but with the establishment in 1977 of the National Board for Science and Technology, a National Environmental Sciences Program was initiated which had as one of its priorities the development of a research program in estuarine and marine coastal pollution. The need for long term base-line research on unpolluted coasts and estuaries in the Republic is pressing, not only to safeguard Ireland's marine environment, but to gain a better understanding of the behavior of animal communities in pristine marine environments in temperate regions. DISTRIBUTION OF POLYCYCLIC AROMATIC HYDROCARBONS IN SEDIMENTS FROM

ESTUARIES OF SOUTHEASTERN AUSTRALIA,

Melbourne Univ., Parkville (Australia). Dept. of Industrial Science.
J. Bagg, J. D. Smith, and W. A. Maher.
Australian Journal of Marine and Freshwater Research, Vol 32, No 1, p 65-73, 1981. 1 Fig, 3 Tab, 16 Ref.

Descriptors: *Aromatic compounds, *Sediments, Path of pollutants, Water pollution sources, Polynuclear aromatic hydrocarbons, Organic compounds, *Australia, Estuaries, Rivers, Benzo(a)pyrene, Urban areas, Indurtrial development, Aerosols.

Levels of the polycyclic aromatic hydrocarbons (PAH), benzo(a) pyrene (BAP) and perylene, were determined in sediments from 23 sites in 3 locations in southeast Australia. Minimum BAP values of 20-60 micrograms per kg dry weight were found at Mallacoota Inlet, remote from urban activity. The maximum concentration, 6800 kg micrograms per kg, was from a Yarra River tributary (Melbourne region) where sediment was contaminated with an oily material. Other levels in the Yarra estuary system ranged from 60 micrograms per kg at the station farthest upstream to 850 micrograms per kg downstream. In Corio Bay, a marine bay near a small city, concentrations of BAP were 180-260 micrograms per kg, except for near a storm water drain inlet, 2000 micrograms per kg. The ratio of BAP: perylene was 1-2, significantly lower than PAH deposited by aerosol. This suggests that the major source of PAH is industrial activity. (Cassar-FRC)

THE SEASONAL VARIATION IN SILICON CONCENTRATION IN CHALK-STREAMS IN RELATION TO DIATOM GROWTH,

Freshwater Biological Association, Warham (England).
H. Casey, R. T. Clarke, and A. F. H. Marker.
Freshwater Biology, Vol 11, No 4, p 335-344, August, 1981. 5 Fig, 2 Tab, 18 Ref.

Descriptors: *Silicon, *Streams, Seasonal variation, Benthos, Diatoms, Chlorophyll A, Rivers, Water chemistry, *Path of pollutants.

Changes in silicon concentration were exained over a relatively long time scale in order to separate regular seasonal cycles from erratic between-year variations. These concentrations were then used to calculate diatom production. The first study site was a bore-hole at a commercial watercress farm. The second was at a point 5 km downstream on the Bere Stream, and the third site was on the River Frome. These water courses are nutrient-rich hardwater streams dominated by macrophytes. Weekly water samples were taken at each site. No apparent seasonal variation was noted in silicon concentration at the bore-hole. In contrast, 5 km downstream there was marked reduction in silicon concentration during the spring but only irregular changes during the rest of the year. Silicon concentrations in the River Frome between 1965 and 1977 showed considerable variations, apart from the substantial reductions in the spring. A negative correlation between suspended chlorophyll-a and silicon concentrations confirms that suspended chlorophyll-a concentrations respond more closely to changes in the loosely attached diatom flora than to other sources of chlorophyll-a. However, neither variable is always suitable for monitoring changes in benthic diatoms. Estimates of diatom production, based on changes in silicon concentration, gave rates of 1-2 grams of silicon/square meter/day in a small headwater chalk stream during the spring. (Baker-FRC)

STORMWATER QUALITY PROCESSES FOR THREE LAND-USE AREAS IN BROWARD COUNTY, FLORIDA,

Geological Survey, Tallahassee, FL. Water Resources Div.
H. C. Mattraw, Jr., and R. A. Miller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-119595, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 81-23, 1981. 56 p, 13 Fig, 16 Tab, 22 Ref.

Descriptors: *Storm runoff, *Urban runoff, *Water quality, Rainfall-runoff relationships, Fallout, Urban hydrology, Data collections, Hydrologic data, *Florida, *Broward County.

Systematic collection and chemical analysis of stormwater runoff samples from three small urban areas in Broward County, Florida, were obtained between 1974 and 1977. Thirty or more runoff-constituent loads were computed for each of the homogeneous land-use areas. The areas sampled were single family residential, highway, and a commercial shopping center. Rainfall, runoff, and nutrient and metal analyses were stored in a data-management system. The data-management system permitted computation of loads, publication of basic-data reports and the interface of environmental and load information with a comprehensive statistical analysis system. Seven regression models relating water quality loads to characteristics of peak discharge, antecedent conditions, season, storm duration and rainfall intensity were constructed for each of the three sites. Total water-quality loads were computed for the collection period by summing loads for individual storms. Loads for unsampled storms were estimated by using regression models and records of storm precipitation. Loadings, pounds per day per acre of hydraulically effective impervious area, were computed for the three land-use types. Total nitrogen, total phosphorus, and total residue loadings were highest in the residential area. Chemical oxygen demand and total lead loadings were highest in the commercial area. Loadings of atmospheric fallout on each watershed were estimated by bulk precipitation samples collected at the highway and commercial site. (USGS)
W82-02469

SIMULATION MODEL FOR AGRICULTURAL NON-POINT-SOURCE POLLUTION,

Montgomery (J. M.), Walnut Creek, CA.
L. J. Tubbs, and D. A. Haith.
Journal of the Water Pollution Control Federation, Vol 53, No 9, p 1425-1433, September, 1981. 6 Fig, 7 Tab, 28 Ref. OWRT-B-055-NY(5), 14-34-0001-7169.

Descriptors: *Model studies, *Nonpoint pollution sources, Pollution load, *Agricultural runoff, Mathematical studies, Phosphorus, Nitrogen, *Nutrients, Simulation, Runoff.

A mathematical simulation model, referred to as the Cornell Nutrient Simulation (CNS) model, is presented which is suitable for estimating dissolved and solid-phase nitrogen and phosphorus in runoff, and dissolved N in percolation from cropped fields with well-drained soils. The CNS model consists of two basic components: a daily soil moisture/erosion submodel that predicts runoff, percolation and soil loss; and a monthly submodel of soil nutrient levels. Validation studies for several small fields in Georgia and New York are included. The nutrient component has a monthly time step. The nutrient balance model estimates monthly losses of dissolved and solid-phase N in runoff, dissolved N in percolation, dissolved P in runoff, and solid-phase P in runoff. Validation studies in Georgia were performed in two small fields that were monitored for runoff, sediment and nutrient loss in runoff from May, 1974 through September, 1975. The New York testing sites are six 0.3 ha plots in Aurora, New York, from which runoff, percolation, and nutrient loss data were collected from January 1972 through December 1973. Measured nutrient, water, and sediment losses were compared with those predicted by the CNS model. Runoff predictions exceeded observations by substantial amounts on both fields in Georgia, although errors were smaller on one. Dissolved N and P were over-predicted by about the same degree as runoff on one field. The most critical problem is in the simulated losses of dissolved P in runoff. In New York there were additional problems which made comparisons of the predictions and the observations meaningless. The principal weakness of the model is in its handling of organic matter such as manures and fresh plant residues. (Baker-FRC)

EFFECT OF DRAINAGE SYSTEM DESIGN AND OPERATION ON NITRATE TRANSPORT,

North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
R. W. Skaggs, and J. W. Gilliam.
Transactions of the ASAE, Vol 24, No 4, p 929-934, July/August, 1981. 9 Fig, 3 Tab, 20 Ref. OWRT-A-086-NC(7), OWRT-B-063-NC(6), 14-34-0001-7070, 14-31-0001-4111.

Descriptors: *Drainage, *Nitrates, Surface drainage, Drainage practices, Subsurface drainage, DRAINMOD, Model studies, Simulation, Resources management, Water pollution sources, Water table, Surface runoff, *Agricultural runoff, Groundwater management.

A study was made to simulate soil water conditions and nitrate outflow from artificially drained soils using a water management computer model. Simulations were conducted for various drainage system designs and operational criteria for a poorly drained soil. The simulation model used is an extension of the water management model, DRAINMOD, developed for drainage and water table control on shallow water table soils. The simulation model predicts water table position, water content distribution, surface runoff, subsurface drainage volume, and seepage volumes at the end of each time increment. If the nutrient concentration of each of the outflow sources is known or can be predicted, total mass outflows can calculated on a day to day basis for a given drainage system design and mode of operation. The performance of the water management system design was evaluated in terms of total annual nitrate outflow and its ability to satisfy trafficability and crop protection requirements. Drain spacing and the quality of surface drainage both have large effects on total annual outflows via surface runoff, subsurface drainage and seepage. Nitrate outflows for the experimental soil are heavily dependent on the drainage system design, and nitrate movement from the field can be minimized by using good surface drainage and wide subsurface drain spacings. While controlled drainage can be used to reduce nitrate outflows when surface drainage is poor, there are potential detrimental effects of designing controlled drainage systems for this purpose. Maintenance of a high water table over the winter months may cause breakdown of soil structure, which would reduce hydraulic conductivity and complicate the drainage problem. A decrease in nitrate may be accompanied by increased phosphorus or pesticide movement in the drainage waters. (Baker-FRC)
W82-02505

PHOTOSYNTHETIC PIGMENTS AS INDICATORS OF ALGAL ACTIVITY IN THE UPPER POTOMAC ESTUARY,

Georgetown Univ., Washington, DC. Dept. of Biology.
P. Sze.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157827, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of the District of Columbia Report No 30, October, 1981. 19 p, 6 Fig, 2 Tab, 12 Ref. OWRT-A-015-DC(1), 14-34-0001-0109.

Descriptors: *Nutrients, Photosynthetic pigments, Chlorophyll A, Centric diatoms, Algae, Chlorococcalean green algae, *Potomac River, *District of Columbia, *Photoplankton, Water temperature, Sampling.

The Potomac River was monitored at Key Bridge from May - September, 1981. Temperature, major nutrients, photosynthetic pigments, abundance of major groups of photoplankton (direct counts), and potential photosynthetic production (oxygen method) were measured weekly in surface samples collected near mid-river. Chlorophyll A showed the same general trends as the cell counts and

production with greatest algal activity in late May and August and a minimum in June. Centric diatoms and chlorococcalean green algae were the major planktonic algae in 1981, as in previous years. The accessory pigments were relatively insensitive measures of algal composition. Overall, the activity of phytoplankton did not show any significant from previous years, and there was no evidence for prolonged nutrient depletion as a result of algal activity in the river.

THE EFFECTS OF RAPID INFILTRATION OF MUNICIPAL WASTEWATER ON GROUNDWATER QUALITY,

Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
H. S. Peavy, P. E. Stark, and T. G. Schwendeman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157900, Price codes: A05 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Report No 117, September, 1981. 72 p, 3 Fig, 8 Tab, 11 Ref, Append. OWRT-A-127-MONT(1), 14-34-0001-0128.

Descriptors: *Groundwater pollution, *Wastewater lagoons, *Water pollution sources, Aquifer characteristics, Soil chemistry, Water quality control, Water analysis, Wastewater disposal, Path of pollutants, *Infiltration, Rapid infiltration, West Yellowstone, *Montana.

The purpose of the research project was to compile and summarize the available information on groundwater quality changes due to rapid infiltration of wastewaters, and to add to that body of knowledge by a field investigation of a rapid infiltration site. A wastewater disposal system practicing rapid infiltration was selected and instrumented. Data was gathered by analyzing samples drawn from wells installed downstream from the infiltration basins. Background data was obtained by sampling existing water supply wells in the same aquifer but upstream from the disposal facility. The data indicated a several fold increase in Total Dissolved Solids, nitrate and ammonia in the groundwater near the infiltration basins. The elevated concentrations attenuated as the groundwater moved away from the area. Other parameters (pH, phosphates, chlorides, COD, fecal coliform bacteria) were not significantly affected by the infiltration of the wastewater. Conclusions are reached that groundwater quality will be affected on a local basis by rapid infiltration of wastewater. The extent of adverse impacts will depend on several variables relating to the volume and character of the wastewater and on infiltration site characteristics. (Hunt-Mont)

SALT-WATER INTRUSION IN THE COSTA DE HERMOSILLO, MEXICO: A NUMERICAL ANALYSIS OF WATER MANAGEMENT PROPOSALS,

Connecticut Univ., Storrs. Dept. of geology and Geophysics.
R. W. Andrews.
Ground Water, Vol. 19, No 6, p 635-647, November/December, 1981. 11 Fig, 38 Ref.

Descriptors: *Saline water intrusion, *Irrigation wells, *Water management, Path of pollutants, *Coastal aquifers, Aquifers, Groundwater recharge, Recharge, Aquifer management, Irrigation water, Model studies, Solute transport, Hydraulic gradient, Wells, Chlorides, Simulation analysis, *Costa de Hermosillo, *Mexico.

The Costa de Hermosillo aquifer, Sonora, Mexico, is being actively intruded by salt water because groundwater withdrawls in this agricultural region are much greater than natural recharge. Total discharge varies between 760 and 1140 million cu meters per year. There have been overdrafts of 450 to 900 million cu meters per year since 1954, with a resulting water table decline up to 40 meters. A model is developed to simulate the hydrologic conditions and water quality to assess the areal and temporal variations in head velocity and concentration as a result of changes in the groundwater withdrawal. Major salt water intrusion has occurred in 2 areas, where total dissolved solids are now 1200 mg per liter. Buried alluvial channels allow rapid transport of salt water inland. Some of the proposals for managing the salt water intrusion problem are: (1) relocating 92 wells further inland to redistribute discharge, and (2) reducing the amount of water pumped from the aquifer by improving irrigation efficiency. No matter which management strategy is chosen, the salt water intrusion is irreversible. Simulated chloride distributions after 34 years depict the 300 and 3000 mg per liter isochlors for both management methods. The reduced pumping scheme is slightly less effective in slowing salt water intrusion because it specifies gradual withdrawal of wells from production over 15 years. The uncertainty in parameter identification permits only a qualitative analysis of these proposals. (Cassar-FRC)

HISTORY OF HUMAN-USE IMPACTS ON LONG POINT BAY,

H. B. Barrett.
Journal of Great Lakes Research, Vol 7, No 2, p 81-88, 1981. 7 Ref.

Descriptors: *Human population, *Environmental effects, Water pollution effects, *Long Point Bay, Canada, *Ontario, Farming, Industrial wastes, Pesticides, Silting, Erosion, Sedimentation, Hunting, Wildlife, Wilderness areas, Wildlife management, Wildlife conservation, Lakes, Lake Ontario, Water pollution sources.

The first detrimental impacts of man appeared on Long Point Bay regions during Indiana times, when erosion took place in areas which had been cleared for farming and left after the crops failed to thrive in succeeding years. Even so, the general impact on the environment caused by the Indian was minimal for almost 1,000 years. The arrival of the white man brought cultivation to various tracts of land. By the first half of the 19th century, activities were many and varied, with the greatest impact being felt due to uncontrolled and illegal lumbering. Wherever a cut was made, wind and water combined to destroy the thin topsoil, create blowouts, and in many cases wash the fragile exposed ridges into the surrounding water. Large parts of Long Point were lost wherever lumbering was carried out. In August of 1866 the Long Point Company was formed for the purpose of controlling the activities in that area which were leading rapidly toward environmental destruction. Almost complete removal of virgin forests in the 1830's and afterward caused the loss of the protective humus from the forest soils. The sediment load of Norfolk's streams increased dramatically and spawning and feeding areas for trout and other species were destroyed. Increased contamination with herbicides and pesticides have been noted in the Inner Bay due to increased agricultural activities. Added to the siltation from agriculture, commercial and urban growth was a great variety of complex pollutants. Toxic wastes from industry, vessels, and vehicles add additional stresses to the area. (Baker-FRC)

MULTIPORT DIFFUSER MIXING ZONES IN RIVERS,

Kansas Univ., Lawrence. Dept. of Civil Engineering.
A. D. Parr, and W. W. Sayre.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 903-917, October, 1981. 12 Fig, 1 Tab, 6 Ref.

Descriptors: *Mixing, *Diffusers, *Thermal pollution, *Fate of pollutants, *Effluents, Effluent standards, Rivers, Heated water, Thermal water, Multiport diffusers, Temperature, Water temperature, Powerplants.

Empirical equations relating the cross-sectional area and discharge of an individual multiport diffuser mixing zone to effluent and ambient river conditions are developed. These are used with expressions for jet spreading and dilution to obtain mixing zone equations. The area enclosed in the isotherm defining the boundary of a single port mixing zone is determined as a function of downstream distance from port, velocity ratio, and critical dilution ratio. Agreement between predicted and measured mixing zone characteristics were reasonably good. This procedure can be used to estimate the river discharge below which environmental mixing zone limitations will be violated for particular multiport diffuser installations. (Cassar-FRC)

MODELING SUSPENDED SOLIDS AND BACTERIA IN FORD LAKE,

Rutgers - The State Univ., Piscataway, NJ.
C. G. Urchin, and W. J. Weber, Jr.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 975-993, October, 1981. 22 Fig, 3 Tab, 26 Ref.

Descriptors: *Bacteria, *Suspended sediments, *Sediment transport, Lakes, Coliforms, Model studies, Mathematical models, *Ford Lake, *Michigan, Turbulent flow, Open channels, Channel flow, Fate of pollutants, Suspended solids, Feces, Water quality.

Transport of suspended solids and associated pollutants is modeled for inclusion in a water quality model. Sediment dynamics is particularly important for nonreactive substances such as polychlorinated biphenyls. The submodel, developed for the case of turbulent open channels, uses a two-dimensional equation for suspended particles in a turbulent flowing medium. A procedure is developed to determine particle fall velocity distributions and a bottom boundary condition calibrated to three sets of flume data. The resulting numerical solution is shown in graphical form as a function of particle fall velocity, channel shear velocity, and channel depth. The model is applied in a system model for Ford Lake, Michigan, with fecal coliforms as the pollutant associated with the suspended sediments. Sedimentation proved to be a major removal mechanism for fecal coliforms in this lake. (Cassar-FRC)

GUIDELINES FOR CONTROL OF SEPTIC TANK SYSTEMS,

California Regional Water Quality Control Board, Oakland.
A. W. Olivieri, R. J. Roche, and G. L. Johnston.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1025-1034, October, 1981. 2 Fig, 17 Ref.

Descriptors: *Septic tanks, *Wastewater disposal, *Water quality control, Regulations, Water policy, San Francisco, California, Population density, Urban areas, Inspection, Maintenance, Nitrates, Bacteria, Percolation, Infiltration, San Francisco Bay area.

The San Francisco Bay Regional Water Quality Control Board, in response to rapid development in the jurisdiction, has set forth guidelines for individual or community sewer systems serving new residential development. This paper reviews

their recommendations with respect to design and construction of septic tank systems, operation and maintenance, and cumulative impacts. Since the half life of properly maintained septic tank systems is 25 years, dual systems are recommended to allow resting and restoration of percolation rates. Periodic inspection of individual septic tank systems is recommended to ensure proper maintenance and correlation of system failures. This is currently being conducted in the Stinson Beach area and includes biennial inspection of all private systems for pumping need, odor, and surfacing effluent. A new law allows small communities to build and maintain on-site wastewater treatment systems, where appropriate, with the technical assistance of public agencies. It was found that septic tank effluent may contaminate domestic water supplies, particularly private wells, and that nitrates may adversely affect coastal waters. Recommendations derived from the study were: (1) the bottom of drainfields and water supply wells should be vertically separated by at least 30-40 ft in decomposing granite soils and 10-20 ft in alluvial soils, (2) one housing unit per 1.4 acres will minimize nitrate contamination in local groundwaters, and (3) septic tank systems should be inspected peridocially. Descriptors: *Potomac River estuary, *Nutrients, *Water quality, *Pollution load, *Wastewater disposal, River flow, Phosphorus removal, Limiting nutrients, Estuarine environment, Algal growth, Water pollution, Eutrophication.

Nitrogen, phosphorus and carbon loadings in the estuary have increased since the early 1920's. Algal and plant vegetation have undergone three major population and community shifts during the period of increased nutrient loading. Carbon loadings began to decline in the late 1950's with phosphorus decreasing in 1970. Nitrogen loadings have remained elevated with a small decline in the mid-70's. Extensive wastewater phosphate removal processes were initiated in 1974. During the summer of 1977 (a below-average flow period), the maximum was 80 micrograms/l for a 14-km reach of the estuary. The algal populations in 1979 were mixed, indicating that the water quality in the upper estuary is improving due to phosphorus being reduced by extensive removal from wastewater discharges. The Potomac River Estuary received in 1980 approximately 460 mgd of wastewater discharges from 8 sewage treatment plants in the upper estuary, which during low flow periods contribute significantly to the freshwater flow into the estuary. The removal of phosphorus has made it the limiting nutrient in the upper reaches of the estuary while in the lower reaches nitrogen or light penetration may be limiting. (Brambley-SRC)

Descriptors: *Estuarine environment, *Estuarine fisheries, *Perch, *Rhode River, Maryland, *Nutrients, Agricultural runoff, River flow, Eutrophication, Chlorophyll, Phytoplankton, Seasonal variation, Dissolved oxygen, Water temperature, Habitats, Nitrogen, Phosphorus, *Low flow, Environmental effects.

The Rhode River, Maryland, was studied over the course of one year to investigate a number of environmental parameters on the spawning and nursery ground activities of white and yellow perch. Total and nitrate-nitrogen, and total and orthophosphate-phosphorus were determined in the estuary and upstream, and land runoff and chlorophyll were determined. Most of the flow occurred in the winter, early spring, and mid to late fall. Phosphorus concentrations reached 2.4 mg/l in mid-July, and remained high through the autumn. Nitrogen levels were highest over this same period, with a maximum of 5.57 mg/l in mid-July. Dissolved oxygen levels seemed to correlate inversely with water temperature, although there were diurnal variations in dissolved oxygen levels. Chlorophyll in phytoplankton reached a maximum in mid-September of 12 mg/1. Cropland was the most important source of both nitrogen and phosphorus, and the nitrogen: phosphorus ratio was high enough for nitrogen to become limiting and eutrophication occurred. Reducing the nutrients in agricultural runoff would prevent eutrophication and produce a more favorable habitat for the perch. (Brambley-SRC)

PHYTOPLANKTON PRODUCTION AND COMMUNITY COMPOSITION IN A MARSH-DOMINATED ESTUARY WHICH RECEIVES SEWAGE WASTE,
Delaware Univ., Newark. Coll. of Marine Studies.
F. C. Dalber, and E. M. Simek, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153685, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware, Technical Completion Report, October, 1981. 73 p, 14 Fig, 6 Tab, 66 Ref, 3 Append. OWRT-A-052-DEL(1), 14-34-0001-1108.

Descriptors: *Phytoplankton, *Tidal marshes, Tidal streams, Productivity, Primary productivity, Aquatic productivity, Organic carbon, Diatoms, Dinoflagellates, Estuaries, Nutrients, *Eutrophication, Sewage, *Murderkill River estuary, *Delaware.

An investigation of the Muderkill River estuary, Delaware was conducted to describe the phytoplankton community, measure phytoplankton production and evaluate this production relative to other sources of organic carbon. Phytoplankton cell counts were highest in March, decreased to low levels by July, then increased and remained fairly uniform at high levels throughout late summer, autumn and winter. The community was dominated by diatoms in winter and spring, and small microflagellates in late summer and early autumn. Phytoplankton production averaged 380 gC/m2/yr, and the average water column respiration rate was 280 gC/m2/yr. During the year, phytoplankton produced an estimated 340 million grams of organic carbon, but water column respiration required 250 million grams of organic carbon. Phytoplankton production was sufficient to account for planktonic respiration from April through mid-October, but the plankton community was not self-sustaining during the rest of the year. Nutrient concentrations, augmented measurably by a wastewater treatment plant, supported high rates of production but the estuary as a whole does not appear to be distinctly eutrophic. A shallow eutrophic zone appeared to limit phytoplankton production. Phytoplankton produced less organic carbon than either the edaphic algae or emergent macrophytes in this marsh system. The phytoplankton contribution to the organic carbon pool in this estuary is considerably less than that from the marsh surface or upstream sources. Despite its relatively small quantitative contribution, phytoplankton carbon is of high quality and its importance in this system must not be discounted.

ENVIRONMENTAL CONTROL TECHNOLOGY DEVELOPMENT FOR GEOTHERMAL ENERGY,
Department of Energy, Oakland, CA. Geothermal Energy Div.
G. Katz.
Journal of the Water Pollution Control Federation Vol 53, No 10, p 1447-1451, October, 1981. 3 Fig, 1 Tab, 11 Ref.

Descriptors: *Water pollution effects, *Environmental control, *Geothermal resources, *Water pollution prevention, Water pollution sources, Ecological effects, Environmental effects, Geothermal power, Geysers, Springs, Thermal springs, Power plants, Thermal power plants, Air pollution.

Some environmental impacts from the use of geothermal energy in the United States and other nations are discussed. Surface water impacts include chemical degradation of domestic, recreational, agricultural and ecosystem resources. Subsurface impact is usually limited to chemical degradation of groundwater supplies. Water pollution sources connected with the harnessing of geothermal energy include well drilling muds, well effluents, power plant effluents and thermal stresses, spills of stored and transported chemicals, and wastes associated with pipeline breaks and power plant operation. Most environmental impact analysis work in the United States has been carried out at the Geysers, a vapor-dominated resource unit in California. With the development of liquid geothermal resources, new environmental issues have arisen. So far, the environmental impacts from geothermal energy utilization have been controllable by present technology. Careful effluent monitoring and a willingness to develop new control technologies when needed are required on a specific site/application approach basis. (Geiger-FRC)

CHEMICAL AND BIOLOGICAL PROCESSES CONTROLLING THE RESPONSE OF A FRESHWATER ECOSYSTEM TO COPPER STRESS: A FIELD STUDY OF THE CUSO4 TREATMENT OF MILL POND RESERVOIR, BURLINGTON, MASSACHUSETTS,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
D. McKnight.
Limnology and Oceanography, Vol 26, No 3, p 518-531, May, 1981. 8 Fig, 4 Tab, 45 Ref.

Descriptors: *Reservoirs, *Copper sulfate, *Algal control, Copper, Eutrophication, Phytoplankton, Primary productivity, Toxicity, Ions.

The phytoplankton succession in Mill Pond (Burlington, Massachusetts) after treatment with CuSO4 was compared to the copper sensitivities of three important species from the pond. Also, the biological response of the aquatic environment to trace metal stress was evaluated. The CuSO4 treatment was performed to control a late summer bloom of Ceratium hirundinella. Initially, the treatment was toxic to C. hirundinella but not to Nannochloris sp. and Ourococcus sp. Initially primary production decreased, but returned to pretreatment levels. After two months, the total copper concentration in the epilimnion returned to background levels, and the phytoplankton was no longer dominated by copper tolerant species. Data indicated that the concentration of free copper ion determined the toxic response of the phytoplankton in the reservoir. (Small-FRC)

HEAVY METALS AND MARINE PHYTOPLANKTON: CORRELATION OF TOXICITY AND SULFHYDRYL-BINDING,

Victoria Ministry for Conservation, Queenscliff (Australia). Marine Science Labs.
N. S. Fisher, and G. J. Jones.
Journal of Phycology, Vol 17, No 1, p 108-111, 1981. 3 Fig, 1 Tab, 17 Ref.

Descriptors: *Algae, *Toxicity, *Heavy metals, Metals, *Phytoplankton, Asterionella, Mercury, Lead, Copper, Cadmium, Mangangese, Zinc, Water pollution effects, Sulfhydryl groups, Amino acids, *Diatoms, Sulfur compounds, *Australia.

The toxicities of 6 heavy metals to the marine diatom Asterionella japonica Cleve were correlated with the solubility products of the corresponding metal sulfides. Depression of growth rates by sublethal concentrations of the metals was greatest for Hg, which has the greatest affinity for sulfur. The EC50s (in micromoles) were as follows: Hg, 0.019; Cu, 0.2; Zn, 0.9; Pb, 1.0; Cd, 2.1; and Mn, 88.3. There was high correlation between log EC50 values and the stability constants of these metals for cysteine or methionine and with stability constants for non-sulfurous amino acids (glycine). However, the stability constants of metal-cysteine complexes were orders of magnitude greater than any metal-amide complex (metal-glycine). These results and those of other workers suggest that the mechanism of metal toxicity to algae is SH group binding, whereupon metabolic processes such as silica deposition are disrupted. (Cassar-FRC)

HYDROPOWER: UNTAPPED RESOURCE AND ENVIRONMENTAL HAZARD,

B. Dampier.
Ambio, Vol 10, No 5, p 252-253, 1981. 1 Fig, 1 Tab.

Descriptors: *Water resources development, *Hydroelectric plants, Water supply development, River basin development, Resources development, Dams, *Environmental effects, Powerplants, Hydroelectric power.

Currently hydropower generates roughly 23% of the world's energy supply. By the year 2020 that figure is expected to be almost quintupled. Perhaps the greatest experience with small scale hydropower is in China, where some 88,000 hydropower plants, averaging about 70 kW each, have been built in the past two decades. Most of the remaining unexploited hydropower reserves are located in the developing nations. Africa, Asia and Latin America together account for about 60% of the world's technically usable hydropower potential. How quickly these hydropower reserves are exploited depends on economic considerations such as construction and fuel costs and the costs of meeting increasingly stringent environmental protection requirements. It is also anticipated that both pumped storage and modifications to existing plants will increase the world's generating capacity. One of the most serious stumbling blocks for the unimpeded proliferation of large hydroprojects is the problem of siltation. Furthermore, large reservoirs created by dams encourage the spread of waterborne diseases such as malaria, schistosomiasis and sleeping sickness. (Baker-FRC)

NITRATE AND AMMONIA UPTAKE IN THE APEX OF THE NEW YORK BIGHT,

Bigelow Lab. for Ocean Sciences, West Boothbay Harbor, ME.
C. Garside.
Limnology and Oceanography, Vol 26, No 4, p 731-739, July, 1981. 5 Fig, 1 Tab, 19 Ref.

Descriptors: *Nitrates, *Ammonia, *Productivity, Phytoplankton, *New York Bight, Nitrogen, Seasonal variation, Eutrophication, Algae, Light intensity, Nutrients, Fate of pollutants, Water pollution effects.

Nitrate and ammonia uptake were measured in the apex of the New York Bight during spring, summer, fall, and winter, 1977-78. Most of the sewage-derived N loading, up to 160 tons per day, reaches this area. Uptake was highest during spring and summer blooms (total nitrate plus ammonia uptake, 1.2 microgram atoms per liter), lowest in fall (total nitrate plus ammonia uptake, about 0.04 microgram atoms per liter). Uptake was a maximum at 50 microEinst per sq meter per sec and was inhibited at higher light intensities. In general, increasing ammonia concentrations caused decreases in nitrate uptake, which amounted to 50% of total inorganic N uptake at a concentration of 2 microgram atoms per liter ammonia. Doubling time of particulate N decreased as blooms developed (from 101 to 17 hours), and depletion times of nitrate and ammonia pools decreased from 7000 to 30 hours and 170 to 1 hour, respectively. At the onset of silicate- or nitrogen-limitation, doubling time and depletion times abruptly increased. Calculation of seasonal productivities gave the following results (in mg N per sq m per day): summer, 125 plus or minus 87; winter, 82 plus or minus 29; and fall, 22 plus or minus 5. (Cassar-FRC)

THE TOXICITY OF 2,4-D TO CYPRINUS CARPIO VAR. COMMUNIS IN RELATION TO THE SEASONAL VARIATION IN THE TEMPERATURE,

Udaipur Univ. (India). Dept. of Limnology and Fisheries.
H. K. Vardia, and V. S. Durve.
Hydrobiologia, Vol 77, No 2, p 155-159, 1981. 4 Tab, 21 Ref.

Descriptors: *Herbicides, *Toxicity, *Fish, Carp, 2,4-D, Seasonal variation, Temperature, Water temperature, Water pollution effects, *Weed control, Aquatic weed control.

The toxicity of 2,4-D, used for aquatic weed control, to carp (Cyprinus carpio) varied with water temperature. Jar tests with fish averaging 6.5 cm in length were performed with 2,4-D at concentrations of 3.2 to 45 ppm for up to 96 hours exposure at temperatures ranging from 17 to 39 C. At the highest temperature, 18 ppm of 2,4-D killed 100% of the fish within 24 hours. At the lowest temperature, 45 ppm of 2,4-D produced 60% mortality after 96 hours. The median tolerance limits (in ppm) at 96 hours were 5.10 at 39 C, 15.30 at 33 C, 20.00 at 28.5 C, 24.15 at 25 C, 31.25 at 20 C, and 35.00 at 17 C. There were no mortalities after 96 hours at 3.2 ppm (39 C), 5.6 ppm (33 C), 18 ppm (28.5 C), 20 ppm (25 C), and 25 ppm (20 and 17 C). (Cassar-FRC)

INTERNATIONAL CONFERENCE ON THE EFFECTS OF ACID RAIN URGES MORE RESEARCH IN CRITICAL AREAS,

Swedish Natural Science Research Council, Stockholm.
M. Falkenmark.
Ambio, Vol 9, No 3/4, p 198-199, 1980.

Descriptors: *Acid rain, *Conferences, *Chemistry of precipitation, Air pollution, Chemical reactions, Vegetation effects, Soil chemistry, Research priorities, Water pollution sources, Water pollution effects.

The International Conference on the Ecological Impact of Acid Precipitation attracted 300 scientists from 17 countries and included the following six main sessions: Transport and deposition, movement through vegetation and direct effects on vegetation, impact on soil and indirect effects on vegetation, effects on water quality, effects on aquatic biota, and integrated studies. The chemical composition of rain is affected by atmospheric pollution. As the rain filters down to groundwater supplies it is further modified by chemical interactions with vegetation and the soil. Catchment hydrology is a crucial factor, and the new Henriksen's acidification predictor diagram for lakes received much attention. This diagram summarized the hydrochemical conditions observed in numerous lakes in terms of pH in precipitation and Ca and Mg in river runoff. A number of research priorities were set, including an increasing focus on the aluminum set free by soil processes and integrated studies with a holistic view. (Small-FRC)

SEASONAL VARIATION IN THE TRACE METAL CONTENT OF MYTILUS EDULIS,

Portsmouth Polytechnic (England). Dept. of Chemistry.
R. Boalch, S. Chan, and D. Taylor.
Marine Pollution Bulletin, Vol 12, No 8, p 276-280, August, 1981. 2 Fig, 2 Tab, 16 Ref.

Descriptors: *Trace metals, *Mussels, Metals, Seasonal variation, Cadmium, Cobalt, Copper, Lead, Manganese, Mercury, Nickel, Zinc, Monitoring, Water pollution effects, *Coastal waters, Paignton, *England.

Data was sought on metal concentration in mussels in an uncontaminated environment at different times during the year. Mussels were obtained from a well established mussel bed in an uncontaminated coastal area at Paignton, South Devon. Thirteen consecutive monthly collections were made from February 1977 through February 1978, and an additional sample was taken in January 1979. The 'normal' values for trace metal content of individual Mytilus edulis covered a wide range, approaching three orders of magnitude in some cases. Although fairly dramatic changes occurred in the concentrations of some metals such as cobalt, manganese and mercury between August and September, there was little evidence of any overall seasonal pattern. Since the 'natural' range of trace metal concentrations varied so widely in this sample population, it is suggested that interpretations of changes in such parameters be made with great care. PERIPHYTON PRODUCTION IN AN APPALACHIAN MOUNTAIN TROUT STREAM,

Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
L. E. Hornick, J. R. Webster, and E. F. Benfield.
American Midland Naturalist, Vol 106, No 1, p 22-36, July, 1981. 4 Fig, 5 Tab, 79 Ref.

Descriptors: *Periphyton, *Primary productivity, *Algae, Productivity, Guys Run, Virginia, Streamflow, Light intensity, Carbon, Nutrients, Seasonal variation, Aquatic environment.

Periphyton primary production was studied in Guys Run, Virginia, a second-order Appalachian Mountain stream, and in two of its tributaries during April 1977 to April 1978. Mainstream primary production averaged 2.27 mg C per sq m per hour (range, 0.4207.16) and in the tributaries, 1.37 mg C per sq m per hour (range, 0.15-5.46). Measurements were obtained in situ, using C14 fixation

in recirculating chambers. In all three streams primary production rates were highest in spring and early summer and declined during summer and autumn. Light, streamflow, and inorganic C influenced primary production. Correlations between primary production and nutrient levels were variable. Mean allochthonous input at five sites was 347 g per sq m per year vertical fallout and 113 g per sq m per year lateral movement or 230 g C per sq m per year. This gives an autochthonous primary production amounting to 3% of allochthonous inputs for the main stream and 2% for the tributaries. This autochthonous output may be underestimated because of sampling techniques. Autochthonous primary production may be of significant importance as a food source for macroinvertebrates in low-order streams during the spring and summer when leaf detritus availability is low. THE EFFECT OF AQUATIC HUMUS ON THE BIOLOGICAL AVAILABILITY OF CADMIUM,

Norsk Inst. for Vannforskning, Oslo.
E. T. Gjessing.
Archiv fur Hydrobiologie, Vol 91, No 2, p 144-149, May, 1981. 3 Fig, 7 Ref.

Descriptors: *Toxicity, *Cadmium, *Humic acids, Water pollution effects, Fish, Salmon, Algae, Chelation, Heavy metals, Metals, Aquatic life, Fate of pollutants.

Cadmium was less toxic to salmon and algae in waters containing aquatic humus than in plain tapwater. Atlantic salmon exposed to 1 mg Cd per liter showed 100% mortality at 32 hours in tapwater, at 47 hours in diluted humus water, and 80% mortality at 90 hours in concentrated humus water. 50% of algae cells were present after 4 days exposure using 5 micrograms Cd per liter in tapwater and about 60-70 micrograms Cd per liter with addition of humus water in the ratios 1:2 and 1:5. Curves were plotted for tapwater and humus concentrations of 1:2 and 1:5 and Cd concentrations from 1 to 500 micrograms per liter. At 10 micrograms Cd per liter about 20% of cells remained after 4 days in tapwater, about 65% in water with added humus at the 1:5 ratio, and over 100% in water with added humus at the 1:2 ratio. (Cassar-FRC)

PRODUCTIVITY AND SPECIES COMPOSITION OF ALGAL MAT COMMUNITIES EXPOSED TO A FLUCTUATING THERMAL REGIME,

Rensselaer Polytechnic Inst., Troy, NY.
D. L. Tison, E. W. Wilde, D. H. Pope, and C. B. Fliermans.
Microbial Ecology, Vol 7, No 2, p 151-165, 1981. 9 Fig, 6 Tab, 25 Ref.

Descriptors: *Aquatic life, *Thermal pollution, Heated water, *Temperature effects, Waste heat, Powerplants, Nuclear reactors, Nuclear powerplants, Nuclear wastes, Swamps, *Algal growth, Algae.

Attempts were made to determine the effect of large fluctuations in thermal regime on algal physiology and species composition at various temperatures in the thermal effluent from the Savannah River Plant. Nuclear production reactors from this plant discharge thermal effluents at 40-45 degrees C above ambient temperatures. Two of the reactors on the site have once-through cooling systems which take in water from the Savannah River and discharge thermal effluents into swamp areas, where temperatures cool to ambient before the waters return to the river. The thermophilic algal flora of this unique swamp habitat was compared with the thermophilic algae of natural hot springs. Rates of primary production and species composition were monitored at four sites along a thermal gradient in a trough microcosm. Blue-green (cyanobacter) were the only phototrophic primary producers growing in water above 45 degrees C. These thermophiles survived and apparently adapted to ambient temperatures when the reactor was shut down. The communities of the algal mat exposed to less than 45 degrees C were composed of blue-green and eukaryotic algae which adapted rapidly to ambient temperatures. During periods of thermal fluctuation an increase was noted in the percentage extracellular release of C-14 labeled dissolved organic compounds and a decrease in primary production. The study suggests that dominant phototrophs in this artificially heated aquatic habitat have been selected for their ability to survive large temperature variations and are similar to those found in natural hot springs. (Baker-FRC)

A COMPARISON OF THE INCIDENCE OF FIVE PATHOLOGICAL CONDITIONS IN SOFT-SHELL CLAMS, MYA ARENARIA, FROM ENVIRONMENTS WITH VARIOUS POLLUTION HISTORIES,

Rhode Island Univ., Kingston. Graduate School of Oceanography.
H. A. Walker, E. Lorda, and S. B. Saila.
Marine Environmental Research, Vol 5, No 2, p 109-123, 1981. 3 Fig, 4 Tab, 20 Ref.

Descriptors: *Clams, *Water pollution effects, Industrial wastes, Organic compounds, Monitoring, Water analysis, Oil refineries, Industrial plants, Oil industry, Oily water, Oil pollution, Rivers, Coastal waters, Estuarine environment, Comparison studies.

Two different analytical techniques were used to compare the distribution of occurrences and cooccurrences of five pathological conditions in samples of the soft-shell clam, Mya arenaria, collected at 17 locations on the east coast of the United States. In the first technique the relative fits of Poisson and Lagrange-Poisson distributions to the data were related to the mortality rate and spread of the pathological conditions. In the second technique, a severity index based on a matrix of occurrences and cooccurrences and the analysis of its eigenvectors were used to measure and to characterize the severity of the spread. The data suggested a possible relationship between the pollution history of the area and the incidence of pathological conditions in the populations surveyed. The occurrence of both neoplasia and hyperplasia affecting more than 10% of a given clam population was more often found in areas impacted with refined petrochemicals. It is suggested that crude oils and heavy metals had less effect on the incidence of hyperplasia and neoplasia than more refined petrochemicals. These two analytical methods demonstrated great utility for the intended comparisons and should find broad application to environmental monitoring and impact assessment studies in general. EFFECTS OF PH, PHOSPHATE, AND AMMONIA ON THE RATE OF UPTAKE OF NITRATE AND AMMONIA BY FRESHWATER PHYTOPLANKTON,

Oklahoma State Univ., Stillwater. School of Biological Sciences.
D. W. Toetz.
Hydrobiologia, Vol 76, No 1/2, p 23-26, 1981. 1 Fig, 4 Tab, 13 Ref.

Descriptors: *Nitrogen, *Phytoplankton, Absorption, Nitrates, Phosphates, Acidity, Ammonia, Natural waters, Algal growth, Nutrients, *Lake Carl Blackwell, *Oklahoma, *Hydrogen ion concentration.

During the summer of 1974 observations were made at Lake Carl Blackwell, Oklahoma, on the effect of phosphate and pH in regulating nitrate and ammonia uptake by phytoplankton using N-13 tracers. The high pH of the lake water noted during 1974 suggested that dissolved inorganic carbon (DIC) was a limiting factor. During 1975 the pH of the water was altered in efforts to vary the quantity of available DIC and added phosphate to see if DIC and phosphate interacted. At ambient pH there was little enhancement of nitrate uptake by additions of phosphate. Similarly nitrate uptake was not markedly changed by pH at any concentration of phosphate. Algal flora in the lake water during the 1975 experiments was a heterogeneous mixture of green algae, diatoms and bluegreen algae, predominantly the latter two groups. During July and August of 1973 the ambient concentration of ammonium limited nitrate uptake. The regression analysis indicates that nitrate uptake approached zero at a concentration of about 210 micrograms ammonium-nitrogen. (Baker-FRC)

STRUCTURAL CHARACTERISTICS OF ALGAL COMMUNITIES IN THERMAL ALTERED ARTIFICIAL STREAMS,

Du Pont de Nemours (E.I.) and Co., Aiken, SC. Savannah River Lab.
E. W. Wilde, and L. J. Tilly.
Hydrobiologia, Vol 76, No 1/2, p 57-63, 1981. 1 Fig, 2 Tab, 35 Ref.

Descriptors: *Streams, *Temperature effects, *Algal growth, Algae, Seasonal variations, Simulation, Bottom sediments, Sedimentation, Sediments, *Thermal pollution, Stream biota.

Differences in algal communities developed and maintained under different temperature regimes are described, song with some characterizations of the substrate affinities and associations of abundant taxa in a South Carolina blackwater stream system. The study site consisted of six artificial streams housed in a greenhouse on the banks of Upper Three Runs Creek near Aiken, South Carolina. Preliminary studies indicated that the algae in the artificial streams could be conveniently distinguished into the following five groups: rocky rapids algae, silty sediment algae, surface scum algae, sandy sediment algae, and miscellaneous attached algae. Thirty-two taxa were raked as abundant in at least one sample during the study. Temperature related shifts in the abundance of major species were demonstrated. Red algae were absent from a stream heated 12.5 degrees C above ambient, but remained abundant in streams heated 7.5 degrees C or less. Water temperatures above 30 degrees C produced blue-green algal dominance and eliminated several indigenous species. Substrate specificity was exhibited by all major taxa. Several taxa were abundant only on the bottom sediments, and others showed a distinct affinity for either sand or silt, which were the principal bottom types. The most obvious observed effect of chronic temperature elevations was the replacement of Vaucheria by Schizothrix. (Baker-FRC)

EFFECT OF PEMBROKE POWER STATION ON THE TEMPERATURES IN MILFORD HAVEN, WALES,

Central Electricity Generating Board, Bristol (England).
R. T. Jarman, and C. M. de Turville.

Water Science and Technology, Vol 13, No 7, p 295-304, 1981. 7 Fig, 5 Tab, 4 Ref.

Descriptors: *Temperature effects, *Electric powerplants, Thermal pollution, *Estuaries, Plumes, Water pollution effects, Powerplants, Water temperature, Cooling water, Outfall, Waste heat, Thermal stress, Model studies, *Milford Haven estuary, *Wales.

The effects of the heat discharge from the Pembroke Electric Power Station on Milford Haven Estuary, Wales, were examined using thermographs, boat surveys, and aerial infrared surveys of the outfall plume. Strong mid-channel currents tended to confine the plume to the southern section of the estuary during most of the tidal cycle. Plume impingement effects were noted at the two southern sample points closest to the outfall. A mean temperature rise of about 0.5 degrees/gigawatt generated/tidal cycle was observed at the Texaco Jetty site, with general warming creating an additional rise of approximately 0.7 degrees/gigawatt/tidal cycle. No significant correlations between temperature rise and electricity generation were found at any of the other sampling sites. A model of the long term heating of the estuary showed that the natural fluctuations in temperature were comparable to the temperature rises recorded at distances of 3 kilometers from the outfall. ON THE TROPHIC STATUS AND CONSERVATION OF KASHMIR LAKES,

Central Inland Fisheries Research Inst., Harwan (India).
K. K. Vass.
Hydrobiologia, Vol 68, No 1, p 9-15, January, 1980. 5 Fig, 2 Tab, 22 Ref.

Descriptors: *Trophic level, *Lake classification, *Eutrophication, *Kashmir Valley, Water quality, Phytoplankton, Water pollution effects, Algae, Aquatic life, Aquatic plants, Water pollution control, India.

Limnologic data, especially trophic state, was documented for 3 lakes in the Kashmir Valley. The lakes (Dal, consisting of 3 sub-basins, Anchar, and Manasbal) lie in the Jhelum River flood plain and are shallow, mean depth 0.6-3.0 meters. Tendencies toward eutrophication were seen in the lakes' morphometry, increased oxygen in the surface layer, hypolimnetic oxygen deficit, increased specific conductivity (200-300 micro s at 25 C), pattern of assimilation curve, and increased phytoplankton production (185-600 mg C per sq meter per day). However, nitrates (20-25 micrograms per liter) and phosphates (5-10 micrograms per liter) were low, plankton blooms have not been observed, and plankton density was low. Dominant phytoplankton groups were Cyanophyta, Pyrrophyta, Chlorophyta, and Chrysophyta. Recommendations for slowing eutrophication in these lakes are: (1) zoning to prevent further development near the lakes, (2) elimination of sewage discharges into the lake from villages and houseboats, (3) controlling dredging, which releases nutrients from sediments, (4) removing weeds and algae by cutting, manatees, or grass carp, and (5) removing nutrients from wastewater before discharge into the lake. GROWTH OF MYTILUS EDULIS IN NET BAGS TRANSFERRED TO DIFFERENT LOCALITIES IN A EUTROPHICATED DANISH FJORD,

Miljostyrelsen, Charlottenlund (Denmark). Marine Pollution Lab.
H. U. Riisgard, and E. Poulsen.
Marine Pollution Bulletin, Vol 12, No 8, p 272-276, August, 1981. 3 Fig, 2 Tab, 12 Ref.

Descriptors: *Eutrophication, *Mussels, *Fjords, Oxygen depletion, Algae, Wind, Brackish water, Seawater, Growth, Hydrogen sulfide, *Denmark.

Growth has been measured in mussels transferred in net bags to different localities in the brackish Danish fjord, Limfjorden, in which certain areas are heavily eutrophicated. Large areas in the fjord suffer each summer from oxygen from the sediments. The increase in flesh dry weight ranged from twice the starting weight at one station to four times as much at another. The net growth efficiency in most cases was about 60% and in two cases above 70%. This indicates that more than 2.3 of the absorbed food energy was used for growth by the mussels. Low growth rates in Mytilus were noted at two stations located in areas with seasonal oxygen depletion. Thus these growth experiments demonstrated that certain conditions of pollution can reduce the growth ability of Mytilus, these being conditions under which low oxygen tension or toxic hydrogen sulfide is released from the sediments on days without strong wind and efficient vertical mixing of the water. It is felt that monitoring Mytilus edulis grown in net bags under standardized conditions in marine recipients can be a useful tool in unveiling biological effects in monitoring programs. (Baker-FRC)

DISCHARGE AND CHEMICAL CHANGES IN A CHALK STREAM HEADWATER AFFECTED BY THE OUTFLOW OF A COMMERCIAL WATERCRESS-BED,

Freshwater Biological Association, Wareham (England). River Lab.
H. Casey.
Environmental Pollution, Series,B, Vol 2, No 5, p 373-385, 1981. 6 Fig, 2 Tab, 17 Ref.

Descriptors: *Streams, *Chemical composition, Farming, Phosphates, Flow discharge, Chemical reactions, Discharge measurement, Effluents, Watercress bed, Chalk stream.

The effects of an outflow from a commercial watercress bed were studied on the discharge and chemistry of a natural chalk stream headwater. The study area was the headwaters of the Bere Stream at Millum Head. The size, shape and management of watercress beds varies between regions and users. Stream discharges were high in the winter and low in late summer and autumn. The increase in discharge between sites 1 and 2 (0.191 and 0.20 cu m/sec respectively) was due to a small input from a side stream and chalk springs feeding water into the bed of the stream. Discharge from the outflow of the watercress bed had a mean value of 0.046 cubic meter/second. In November of 1978 the outflow from the watercress-bed was providing twice as much water to Bere Stream as the natural source at Millum Head. Weedcutting caused large variations in water depths, and a late autumn weedcut reduced the stream to a shallow trickle of water. The chemical composition of the Millum Head stream was stable except in times of heavy rain. The water is well buffered with respect to pH and calcium bicarbonate. The chemical composition of the watercress bed outflow showed much greater variation, due to human management. It was concluded that the discharge from the watercress bed outflow would have a beneficial effect upon the chalk stream headwater in low flow periods. The high concentration of reactive phosphate in the bed outflow water will raise stream reactive phosphate concentrations, as the bed is responsible for 39.3% of all reactive phosphate throughput. WATERBORNE DISEASE IS PREVALENT IN EGYPT,

C. L. Senn.
Journal of Environmental Health, Vol 43, No 1, p 30-31, July/August, 1980, 4 Tab.

Descriptors: *Water quality, *Human diseases, Diseases, Regulations, Standards, *Egypt, Regional development, Water supply, Water supply development, Waterborne diseases.

In a special study at the Children's Hospital and Cairo University involving 100 diseased infants age 3 months to 2 years, bacillary dysentery organisms were recovered from 22 cases. The suspected causes of illness in the remaining cases included viruses and other organisms. The infant death rate for Egypt is about 114 per 1000 live births, comparable to other countries in that region. Mothers are advised to breast feed their infants as long as possible. Mothers are advised to boil bottle milk, but probably many do not. Mothers in poor communities are supplied with powdered milk, but it is often reconstituted with contaminated water. Control of infant disease calls for education to minimize urine and fecal contamination of streams, and snail control by natural and chemical means. It is extremely important that water be piped into the homes, thus avoiding contamination of a common water supply by handling and dipping. This also facilitates washing of vegetables and fruits, dishes and utensils. Having water within the living unit promotes better personal hygiene and has caused reductions in several diseases. The existing water system of the Greater Cairo Region has been greatly over-taxed. Pressure is inadequate to carry water continuously to higher than the second floor in many places. Programs are needed to reduce leakage and wastage and which can offer adequate protection and enforcement programs to safeguard the water. (Baker-FRC)

ASPECTS OF WATER POLLUTION IN LAKE NAINI TAL, U.P., INDIA,

Kumaun Univ., Naini Tal (India). Dept. of Zoology.
M. C. Pant, P. K. Gupta, J. Pande, P. C. Sharma, and A. P. Sharma.
Environmental Conservation, Vol 8, No 2, p 113-117, Summer, 1981. 2 Fig, 4 Tab, 14 Ref.

Descriptors: *Lake Naini Tal, *Water pollution effects, *Coliforms, Water quality, Aquatic life, Lead, Manganese, Biochemical oxygen demand, Dissolved oxygen, Eutrophication, *India.

The water quality of Lake Naini Tal, India, was analyzed in a year long study which tested lake water samples for coliform bacteria, metallic ions, physico-chemical features, and biological characteristics. The most probable number of coliform bacteria varied from 0.59 times 10 to the 5th power per 100 ml during the spring to 3.61 times 10 to the 5th power per 100 ml during the monsoon. Dissolved oxygen concentrations were high near the surface and low near the bottom, and BOD values always exceeded 6.0 mg/liter. Concentrations of NO3-N and PO4-P were high enough to cause phytoplankton blooms upon occasion. Lead and manganese were found at higher than permissible levels. Most of the carp fish were infected with Saprolegnia or other fungi or with trematodes. Phytoplankton and zooplankton were abundant. Macrobenthic species were absent from the profundal zone of the lake, which was severely polluted. (Small-FRC)

RELATIONSHIP BETWEEN POPULATIONS OF AMPHIPODS AND POLLUTION,

Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
D. Bellan-Santini.
Marine Pollution Bulletin, Vol 11, No 8, p 224-227, August, 1980. 4 Fig, 1 Tab, 14 Ref.

Descriptors: *Amphipoda, *Water pollution effects, *Aquatic populations, Aquatic animals, Crustaceans, Population dynamics, Population density, *Mediterranean Sea, *France, *Coastal waters, Gammarus.

The effects of pollution on the composition and distribution of amphipod populations inhabiting rocky environments in the French Mediterranean coastal waters have been investigated over an 18-year period. Nineteen series of between 10 and 15 samples of 400 square centimeters each were analyzed as to species, number of individuals, partial dominance, Shannon-Weaver and Margalef Index of diversity, and similarity index of Sanders. The area studied ranges from the Rhone delta to the peninsula of Embiez and includes the Gulf of Fos, which experiences strong industrial pollution, and the Cove of Cortiou, which receives mainly domestic wastes from the City of Marseille. The global study of the amphipod population showed

that the mean number of amphipod species decreased with increasing pollution; that the mean number on individuals decreased with increasing pollution; that the Margalef diversity index decreased when pollution increased; and that there appear to be two amphipod subpopulations: one in pure or very pure water and one in more or less polluted water. Eleven of the 39 amphipod species inventoried represented 74.9 percent of the total specimens. A total of 35 species of gammarids and 4 species of caprellids were represented by over 90,000 individuals. Although no characteristic group of species was found to be typical of areas affected by pollution, certain species were excluded by more severe pollution. The species of the genous Hyale, a grazing species, led the dominant group in pure or very pure water, while Jasa falcata and Podocerus variegatus, both suspension feeders, comprised the essential elements of the dominant group found in more or less strongly polluted waters. AGGLUTINATION AND BACTERICIDAL RESPONSES OF THE CHANNEL CATFISH TO SALMONELLA PARATYPHI,

Memphis State Univ., TN. Dept. of Biology.
D. D. Outh, and E. A. Wilson.
Developmental and Comparative Immunology, Vol 5, No 2, p 261-270, 1981. 2 Fig, 2 Tab, 20 Ref. OWRT-A-056-TENN(3), 14-34-0001-9045.

Descriptors: *Channel catfish, *Commercial fish, Fish farming, Agriculture, Recirculated water, Water reuse, *Catfish, *Bacteria, *Immunization, Salmonella paratyphi, *Antibiotics.

Intraperitoneal immunization of channel catfish, Ictalurus punctatus, with Salmonella paratyphi in Freund's complete adjuvant produced persistent agglutinating antibody titers of hundreds of thousands during a 1-year response. Bactericidal activity of 2 high-titered sera averaged 30% and 20%. Post-immunization bactericidal activity varied little and remained within 10% of pre-immunization bactericidal activity. Fresh channel catfish serum from unimmunized catfish exhibited 100% bactericidal activity against S. paratyphi. Lysozyme was present in fresh channel catfish serum at 1.8 micrograms/ml serum or 34 ng lysozyme/mg protein.

THE STUDY OF PHOSPHORUS AND NITROGEN FLUXES IN ENRICHED ISOLATION COLUMNS,

Natal Univ., Pietermaritzburg (South Africa). Dept. of Botany.
A. J. Twinch, and C. M. Breen.
Hydrobiologia, Vol 77, No 1, p 49-60, 1981. 6 Fig, 44 Ref.

Descriptors: *Nutrients, *Algae, *Eutrophication, Periphyton, Phosphates, Nitrates, Seasonal variation, Sediments, Chlorophyll a, Water pollution effects, *Midmar Dam, *South Africa.

Nutrient fluxes were studied in 4 isolation columns placed in 3.5 m of water in Midmar Dam, South Africa, a turbid oligotrophic impoundment. The columns were enriched weekly to add the following (in micrograms per liter): P, 150; N, 200; and P, 150, plus N, 200. One column was left unenriched as a control. All enrichment treatments caused increased chlorophyll concentrations. Large seasonal variations were observed. Addition of phosphate alone only increased chlorophyll concentrations to the point of nitrate limitation. Most of the phosphate was adsorbed by sediments. Nevertheless, soluble reactive P concentrations were high in August-October. This was probably a result of P mobilization from the sediments. Addition of nitrate produced no response in chlorophyll levels between April and early August, but in summer (January-March) a bloom of Microcystis sp. occurred. Enrichment with both phosphate and nitrate produced eutrophic conditions in January-March. (Cassar-FRC)

5D. Waste Treatment Processes

MICROBIAL PURIFICATION OF RECYCLED WASTEWATER IN A CLOSED SYSTEM,

West Virginia Univ., Morgantown. Water Research Inst.
W. J. Shoupp, J. M. Dingess, and P. G. Moe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153693, Price codes: A04 in paper copy, A01 in microfiche. Information Report 15, 1981. 64 p, 18 Fig, 11 Tab, 98 Ref. OWRT-A-034-WVA(2), 14-34-0001-9052.

Descriptors: *Domestic wastes, *Microorganisms, *Reclaimed water, *Recycling, *Sewage bacteria, *Wastewater disposal, *Wastewater treatment, Biodegradation, Ecological balance, Ecological distribution, Ecosystems, Microbial degradation, Microbiology, Septic tanks, Wastewater pollution.

A recycling sanitary-waste disposal system was developed and tested in the laboratory by using a synthetic fecal-urinous waste material. The system was capable of supporting an aerobic microbial population with an organic loading equivalent to the waste of three adults by using an aeration rate of 12 liters of air per minute. Increasing the temperature of the digestion tank from 23 C to 34 C reduced the rates of sludge and ammonia-nitrogen accumulation but had little effect on BOD-reduction efficiency. Reducing retention time of the waste in the digestion tank increased the rate of mineral-salt accumulation but had no deleterious effect on the microbial population during an eight-week period. Shock loads of feed up to seven times normal rate caused temporary perturbations, but the microbial population in the system showed remarkable stability and rapid recovery. Indicator organisms were unable to establish themselves in the microbial population and perished within a few hours indicating no serious health hazards in a home. The BOD-reduction efficiency was generally better than 85 percent, and the total carbon (carbon dioxide) lost was better than 95 percent. The main limiting factors were inadequate aeration and mineral-salt accumulation.

THE EFFECT OF PH AND HALOGENS ON THE STABILITY OF REVERSE OSMOSIS MEMBRANES,

California Univ., Los Angeles. Dept. of Chemical, Nuclear, and Thermal Engineering.
S. B. McCray, J. Glater, and J. W. McCutchan.
Report UCLA-ENG-8115, WRC 73, July, 1981. 115 p 60 Fig, 10 Tab, 40 Ref, 2 Append.

Descriptors: *Reverse osmosis, *Halogens, *Hydrogen ion concentration, *Membrane processes, *Wastewater treatment, Salt rejection, Cellulose acetate membranes, Fluctuations, Polymers, Disinfection, Bromine, Chlorine, Iodine, Membranes.

Recently there has been an increase in the number of reverse osmosis plants built for the reclamation of wastewater, agricultural water, and industrial cooling water. Crucial to the operation of a reverse osmosis plant is the pretreatment of the feed water. To control microbiological growth, water disinfectants such as chlorine, iodine, bromine chloride, and chlorine dioxide are used. This study examines the response of certain commercial reverse osmosis membranes, including cellulose acetate and various types of polyamide homogeneous and composite films, to various chemical environments. For cellulose acetate, product flux is found to increase exponentially with time, while salt rejection decreases linearly. Rate constants describing these processes have been calculated at various temperatures. Results indicate that product flux and salt rejection follow first order and zero order kinetics, respectively. Activation energies have also been calculated for flux increase and salt rejection decline for cellulose acetate at pH 2.0 and 8.6. Apparently water flux and salt rejection are controlled by different mechanisms. In general, cellulose acetate membranes are resistant to halogens for up to three weeks at concentration levels equivalent to 30 ppm C1-2. All other membranes tested, however, are attacked by halogen agents under certain conditions, depending on solution pH and polymer type. The agents showing greatest promise for disinfection of polyamide membranes are chlorine dioxide at near-neutral pH and iodine at any pH level from 3.0 to 8.6. (Garrison-Omniplan)
W82-02188

ECONOMIC IMPACT OF EXISTING AMMONIA NITROGEN WATER QUALITY STANDARD, IPCB CHAPTER 3, RULE 203 (F),

Southern Illinois Univ. at Carbondale. Dept. of Thermal and Environmental Engineering.
C. B. Muchmore, W. M. Lewis, R. C. Heidinger, M. H. Poller, and L. J. Wawronowicz.
Illinois Institute of Natural Resources, Chicago, Document No 81/23, July, 1981. 202 p. 42 Fig, 28 Tab, 68 Ref, 8 Append.

Descriptors: *Ammonia, *Water quality standards, *Nitrogen compounds, *Water treatment facilities, *Ammonium compounds, Ionization, Nitrogen, Nitrification, Fish populations, Economic aspects, Operating costs, Capital costs, Stream pollution, *Economic impact, *Illinois.

This economic impact study was designed to provide additional information on existing ammonia nitrogen water quality standards by determining the actual effect of ammonia nitrogen on fish diversity and number based on measurements at selected sites in Illinois. In addition, further cost data were desired. The results of the study support the importance of considering concentrations of un-ionized ammonia, rather than total ammonia, in establishing allowable levels for Illinois streams. A previously suggested value of 0.04 mg/1 un-ionized ammonia is consistent with the results of this study for the higher-diversity streams studied. For those streams that are not capable of supporting a diverse fish population, somewhat higher ammonia levels would probably not produce adverse effects. The major economic impact of attaining the current 1.5 mg/1 ammonia nitrogen water quality standard would be on local government. The current evaluation confirmed the estimate of a previous study that municipal facilities would require about $180 million for capital investment, and $12 million in annual costs. Private dischargers would require $100 million in capital investment and $6 million in annual operating costs. Available cost

estimates to provide nitrification facilities for some of the treatment plants in this study indicated annual operating costs alone to be in the range of $0.83 to $2 per person. The economic impact of enforcement of the existing standard on industry was estimated to be $33.6 million in capital investment and $1.8 million in annual operating costs. The economic burden on agriculture is estimated to be small. (Garrison-Omniplan)

INDUSTRIAL PRETREATMENT NEEDS TO BE OVERHAULED AT THE NATIONAL LEVEL.

Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1452-1456, October, 1981.

Descriptors: *Wastewater treatment, *Industrial wastewater, *Sewage, *Water quality standards, Municipal wastewater, Wastewater management, Hazardous materials, Pretreatment of water, Water pollution control, Environmental protection, Guidelines, Standards, Regulations.

The Federal Water Pollution Control Act of 1972 requires pretreatment of industrial wastewater before discharge to municipal systems. Although most municipal treatment authorities have sewer use ordinances, many metropolitan regions do not have active discharge control programs. Progress in the implementation of industrial sewerage plans has been slow due to complex pretreatment regulations as result of court actions and administrative decisions within the environmental Protection Agency. Also, more research is needed on the types of toxic wastes controlled under certain pretreatment schemes. The current state of the national pretreatment policy is discussed, along with five steps recommended by the Water Pollution Control Federation to improve the program. The five recommendations advocate distinguishing between direct and indirect industrial dischargers, establishing uniform pretreatment requirements for old and new indirect dischargers, eliminating the concepts of 'indicator pollutants' and removal credits, and encouraging stronger state and local pretreatment programs through federal actions. (Geiger-FRC)

ENGINEERING DESIGN VARIABLES FOR THE ACTIVATED SLUDGE PROCESS.

American Society of Civil Engineers, New York. Committee on Water Pollution Management.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE3, p 473-503, June, 1980. 12 Fig, 16 Tab, 19 Ref.

Descriptors: *Design criteria, *Wastewater treatment, Effluents, Nutrients, Sludge disposal, Lagoons, Nitrogen, Phosphorus, *Activated sludge process, Aerated lagoons, Oxidation ditch.

Operational criteria of a specific biological process and its modifications which are often used in secondary waste treatment of prodominantely domestic wastewaters are reviewed. Variations of the activated sludge process considered include the conventional process, step aeration, tapered aeration, complete mix, aerated oxidation lagoon, oxidation ditch, high purity oxygen, contact stabilization, Draus process, high rate extended aeration, and modified or combination processes. Factors such as efficiency of biological oxygen demand removal, efficiency of suspended solids removal, cost of construction, efficiency of operation, quantity of sludge production, and nutrient removal must be considered for each variation of the overall method in selecting what is best for use in a particular situation. Operational data was obtained from waste treatment plants in Florida, Maine, New York, Pennsylvania and Virginia. It appeared in general that plants with 0-1 mgd flows achieved higher percentages of BOD and SS removals than did the larger facilities. In most cases where actual performance fell short of design performance, this was due to combinations of design and operation shortcomings. Common design faults include peak flow wash-out rates in final settling tanks, hopper slopes less than 60 degrees, settling velocities in channels and piping carrying activated sludge solids, insufficient return sludge capacity and control, and insufficient oxygen available and distributed to meet demand. This review also considered the characteristics of raw wastewater, nutrient requirements of aerobic processes, toxic and shock load sensitivity, sludge handling and disposal, and nitrogen and phosphorus removal. (Baker-FRC)
W82-02199

PROCESSES--NOT PRODUCTS--BIGGEST ENERGY-SAVING FACTORS.

Water and Sewage Works, Vol 127, No 11, p 43, 62, November, 1980. 1 Fig.

Descriptors: *Energy conservation, *Wastewater treatment, *Water treatment, Costs, Cost analysis, Conferences, Reviews.

This article reviews in general the emphasis placed on energy conservation measures in water and wastewater treatment fields. One major emphasis of recent energy seminars is to analyze treatment plants not only from the standpoint of how the industry's use of energy compares with total energy requirements of the nation, but also how different parts of the total treatment system rate comparatively. Much effort has been put into extracting the last measure of efficiency from a particular system component, when vastly greater energy savings might be gained from other areas of the treatment train. Since treatment phases are interrelated, it is often necessary to work back and forth between different phases to gain an understanding of the entire picture. The performance of the treatment facility can also be affected by the quality of the wastewater itself. Emphasis in the seminars was also given to overland flow, infiltration, and spray irrigation. Energy conserving peripheral devices such as heat exchangers, automatic and computer controls and active and passive solar energy collectors were discussed. (Baker-FRC)

BIODEGRADABILITY STUDIES WITH ORGANIC PRIORITY POLLUTANT COMPOUNDS,

Municipal Environmental Research Lab., Cincinnati, OH.
H. H. Tabak, S. A. Quave, C. I. Mashni, and E. F. Barth.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1503-1518, October, 1981. 2 Fig, 7 Tab, 37 Ref.

Descriptors: *Biological wastewater treatment, *Microbial degradation, *Pollutants, *Wastewater treatment, Biodegradation, Pesticides, Polychlorinated biphenyls, Organic compounds, Organic wastes, Gas chromatography, Dissolved solids, Organic carbon.

The microbial degradation and acclimation of 96 of the 114 organic priority pollutants included in the US EPA Consent decree list were studied by a static-culture flask-screening procedure using gas chromatoraphy, dissolved organic carbon (DOC) and total organic carbon (TOC) analysis. Phenol was used as a control compound in each biodegradability evaluation series. For incubation and unmetabolized substrate recovery, various techniques were used for phenols, phthalate esters, naphthalenes, monocyclic aromatics, polycyclic aromatics, polychlorinated biphenyls, halogenated ethers, nitrogenous organics, halogenated aliphatics, and organochlorine insecticides. Good agreement was noted for results obtained using the present technique and those found in the literature, utilizing a variety of biodegradation procedures. Priority pollutants that showed no significant degradation under the static-culture-flask methodology cannot be presumed to be completely recalcitrant to microbial action. More rigorous methods are recommended to ascertain the microbial biodegradability of pollutants that did not pass the static-culture-flask screening tests. (Geiger-FRC)

DUPONT'S WASTEWATER TREATMENT APPROACH,

DuPont Co., Wilmington, DE.
D. C. Hubinger, and D. G. Hutton.
Industrial Wastes, Vol 27, No 5, p 41-43, September/October, 1981. 2 Fig, 3 Tab.

Descriptors: *Chemical wastewater, *Activated carbon, *DuPont Company, *Wastewater treatment, Industrial wastewater, Biological treatment, Organic compounds, Chemical industry.

The DuPont Co. uses the PACT process (powdered activated carbon/biological treatment) to treat 35 mgd of wastewater from its Chambers Works, a complex chemical manufacturing plant, as well as 30-40 tank loads trucked in daily from other waste generators. The two-step process includes primary treatment by lime neutralization and settling (removes heavy metals, acids, and solids) and the patented PACT process (removes organics and color). Primary sludge of 45% solis is disposed of in a lined landfill. Powdered activated carbon is added to the primary clarifier effluent as it is fed to biological aeration tanks. After final clarification with polyelectrolytes, the effluent is lagooned and then discharged to the Delaware River. Sludge from the biological treatment process is treated in a multiple hearth furnace where biomass and organics are destroyed and carbon removal, 65%, in spite of the variable composition of the feed. The PACT process is available for licensing by other companies. (Cassar-FRC)

ENVIRONMENTAL PHENOTYPIC VARIATION OF SCENEDESMUS DIMORPHUS IN HIGH-RATE ALGAE PONDS AND ITS RELATIONSHIP TO WASTEWATER TREATMENT AND BIOMASS PRODUCTION,

Ben-Gurion Univ., Sde Boker (Israel). Inst. for Desert Research.
G. Oron, G. Shelef, and A. Levi.
Biotechnology and Bioengineering, Vol 23, No 10, p 2185-2198, October, 1981. 4 Fig, 1 Tab, 25 Ref.

Descriptors: *Wastewater treatment, *Algae harvesting, Proteins, Algal growth, Algae, Biological oxygen demand, Ponds, Aerated lagoons, Nutrients.

The practical and economic aspects of high rate algae pond operation for wastewater treatment and protein production were investigated using two pilot ponds and two fields, each of about 0.1 hectare, continuously fed with raw sewage for a total biological oxygen demand (BOD) of about 300 mg/liter, from an adjacent residential quarter. The pond effluent depth was kept at 35-45 cm, and an average flow rate of 10 cm/second was maintained. The predominant species was Scenedesmus dimorphus, although during certain periods Micractinium pusillum and M. quadrisetum were dominant. On monitoring the ponds it was noted that S. dimorphus was capable of appearing in at least four identifiable forms. Studies of these changes in form were conducted in a series of miniponds, each 110 liters in volume and 40 cm in depth, with different mixing and aeration methods applied. Effluent samples were drawn from the miniponds twice a week and analyzed for BOD and chemical oxygen demand. The conditions under which each form of S. dimorphus was grown were categorized. The relationship between the algal biomass and treatment efficiency and operational conditions was then examined in a set of experiments which included continuous and periodic mixing and aeration methods. The findings indicated that changes in the appearance of S. dimorphus were affected by variations of climatic conditions and operating regime, as well as by the nuritional fertility of the medium. These changes morphologically included types of colony arrangements, cell shapes, and chloroplast distributions. Wastewater treatment efficiency and algal yield were also correlated with the S. dimorphus type produced. (Baker-FRC)

PILOT-SCALE INVESTIGATIONS WITH GRANULAR ACTIVATED CARBON,

Thames Water Authority (England).
R. J. Vincent.

Effluent and Water Treatment Journal, Vol 21, No 8, p 351-354, 356, 357, August, 1981. 6 Fig, 3 Tab, 8 Ref.

Descriptors: *Wastewater treatment, *Activated carbon, Carbon, Adsorbents, Trace metals, Industrial wastes, England, Filtration, Water treatment, Water supply.

Use of granular activated carbon for treatment of a sewage effluent is discussed. GAC treatment was studied at two distinct points in the water supply progression: first from sewage effluent at the Deephams sewage works, and second from slow sand filtered water at the Coppermills filtration station. Deephams has a dry weather discharge of 185,000 cubic meters/day and treats a sewage derived from the industrialized area of northeast London, using the activated sludge process. Coppermills filtration station is able to supply 491,000 cubic meters/day to a large area of eastern London, with raw water obtained from the River Lee or the River Thames. After long term storage, usually 100 days in artificial reservoirs, the water is treated by rapid sand filtration and slow sand filtration prior to chlorination and distribution. Application of GAC filtration to the Deephams effluent clearly produced an improved effluent quality in terms of total organic carbon, biological oxygen demand, and color, with efficiencies dependent on empty bed contact time. The lifetime of the filter with regard to adequate removal of trace organic compounds is not known. The Deephams effluent also contained significant amounts of certain trace metals. These were reduced during GAC filtration, but only during the first operational period of the GAC. For the second operational period, the GAC was reactivated and returned to the filter. No significant reduction of zinc or cadmium occurred during this operational priod. This change was attributed to the failure of the reactivation process to remove refractory adsorbates. (Baker-FRC)

SIMULATION OF A TIME DEPENDENT ACTIVATED SLUDGE WASTEWATER TREATMENT PLANT,

Texas Univ. at Austin. Dept. of Civil Engineering.
W. Tanthapanichakoon, and D. M. Himmelblau.
Water Research, Vol 15, No 10, p 1185-1195, October, 1981. 9 Fig, 1 Tab, 30 Ref.

Descriptors: *Model studies, *Wastewater treatment, Mathematical models, *Activated sludge process, Simulation, Monitoring, Clarifiers, Aeration, Water treatment facilities.

A dynamic model of an activated sludge waste treatment plant is described, examples of typical simulation results are offered, and a sensitivity analysis of an example plant is given. The model consists of three components, a primary settler, an activated sludge aeration tank, and a final clarifier-thickener. Particular care was taken in modeling the plant components to properly represent the mixing of materials that occurs within each of its units. The dynamic model compiled represents the operation of a typical plant reasonably well and in considerable detail. The model is general enough so that the values of the model parameters can be replaced with those applicable to a specific plant with little effort on the part of the analyst. Such models can be used in the design of new plants and in the analysis of the operations of existing ones. With the aid of this model it was posible to simulate simultaneously the diurnal response of a number of significant variables, including dissolved biological oxygen demand, suspended solids, dissolved volatile solids, active mass, inert mass, soluble nonbiodegradable mass, Nitrosomonas mass, Nitrobacter mass, ammonia, nitrite, nitrate and dissolved oxygen. The equations for the model as well as the results of simulations are presented. (Baker-FRC)

PHOSPHORUS REMOVAL BY ACTIVATED ALUMINA,

Technion-Israel Inst. of Tech., Haifa. Environmental and Water Resources Engineering.
N. Narkis, and M. Meiri.
Environmental Pollution, Series B, Vol 2, No 5, p 327-343, 1981. 10 Fig, 1 Tab, 19 Ref.

Descriptors: *Water treatment, *Phosphorus removal, Acidity, *Wastewater treatment, Phosphates, Adsorption, Activated alumina.

The use of activated alumina for removal of phosphorus from sewage treatment plant effluents and from synthetic aqueous solutions was investigated. Analysis of various phosphorus compounds in biological treatment effluents showed that 99.4% of the total phosphorus is soluble, and 98% of this is present as inorganic orthophosphates. There are a number of forms of orthophosphates in equilibrium, with the predominant form changing as pH changes. Synthetic aqueous solutions of orthophosphates were prepared in distilled water at concentrations typical for sewage treatment plant effluents. In batch experiments, aeration biological treatment effluents containing 36.4 mg/liter of phosphate were treated with 1.5 g/liter of Merck acidic activated alumina. The pH was held at 5.7 and the temperature was 26 degrees C. Equilibrium was reached after 6.5 hr. When using various pH levels, maximum phosphate removal was achieved from distilled water solution at 4.5 in both acidic and basic activated aluminas. Acidic Merck activated alumina showed a better removal capacity than basic alumina when tested on biological sewage treatment plant effluent. The presence of calcium or magnesium in sewage treatment plant effluent increases the alumina capacity for phosphate removal at pH 8.0, typical for effluents. The use of activated aluminas adds no salts to the treated water, nor does it produce a nuisance of sludge handling or treatment before ultimate disposal. The activated alumina can be easily regenerated with sodium hydroxide solution. The process is applicable to phosphorus removal from waste treatment effluent and clear wastewaters containing orthophosphates and polyphosphates with an efficiency higher than that obtainable by chemical precipitation or flocculation. COUPLED TRICKLING FILTER-ROTATING BIOLOGICAL CONTACTOR NITRIFICATION PROCESS,

Union Carbide Corp., South Charleston, WV.
D. Marsh, L. Benefield, E. Bennett, D. Linstedt, and R. Hartman.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1469-1480, October, 1981. 25 Fig, 1 Tab, 12 Ref.

Descriptors: *Nitrification, *Wastewater treatment, *Biological filters, *Trickling filters, Mathematical studies, Design criteria, Ammonia, Biological oxygen demand, Biological wastewater treatment, Hydraulic loading, Pilot plants, Suspended solids.

Pilot plant studies were used to determine the effectiveness of a rotating biological contactor system for the nitrification of trickling filter effluent. To quantify the relationship between effluent ammonia concentration, influent ammonia concentration and total BOD concentration, wastewater temperature, and media surface area for the Boulder, Colorado Waste Water Treatment Plant, an equation was developed. This expression showed that the effluent ammonia concentration varied directly with the influent ammonia concentration and the influent total BOD concentration, but varied inversely with the temperature and media surface area of the wastewater. For any RBC nitrification system, the change in the effluent ammonia concentration as a result of hydraulic surging was an important design criterion. An equation was developed to quantify the relationship between the surge effluent ammonia concentration, design loading factor, hydraulic loading and influent ammonia concentration. Results showed that the influent suspended solids concentration was essentially the same as the effluent suspended solids concentration, suggesting that little excess sludge will be generated during nitrification in a separate-stage RBC system. Settling column tests showed that the effluent suspended solids settle rapidly and should be easily removable in well-designed clarifiers. (Geiger-FRC)

SHALLOW-DEPTH SEDIMENTATION OF BIOLOGICAL MATERIALS,

Rensselaer Polytechnic Inst., Troy, NY.
H. R. Bungay.
Annals of the New York Academy of Sciences, Vol 369, p 335-340, 1981. 4 Fig, 1 Tab, 6 Ref.

Descriptors: *Sedimentation, *Biological samples, Separation techniques, *Water treatment, Wastewater, Wastewater treatment.

Performance of conventional sedimentation equipment for the sedimentation of biological materials is generally poor. However, sedimentation is of practical value in biological waste treatment processes, since costs are relatively low and subsequent processing steps benefit from lessening of their input loads. If collection efficiencies could be improved to over 90%, there would be highly significant savings on new plants due to smaller sized steps for biological oxidation. Conventional, shallow-depth, and cross-flow plate sedimentation offer different advantages. Lamellar sedimentation is gravity collection with a short sedimentation path. Designs tubes or closely spaced plates are finding practical use. Since shallow-depth sedimentation achieves high performance at low cost, it should be much widely used with biological systems. It may be possible to incorporate the settlers into other equipment such as industrial fermentors or biological waste treatment units. Potential uses include collection of algae, collection of particles less dense than the liquid, classification of different particles in a series of lamellar settlers with varying detention periods, and separation of particles that rise from those that settle. A COMPENDIUM OF EXPERIMENTAL WORK ON CHEMICAL PRECIPITATION OF SEWAGE,

T. Stones.
Water Pollution Control, Vol 80, No 3, p 421-432, 1981. 11 Fig, 25 Ref.

Descriptors: *Wastewater treatment, Water treatment facilities, Primary wastewater treatment, Aluminum sulfate, Lime, Acidity, Sludge, *Chemical precipitation, *Suspended solids.

The process of chemical precipitation consists of adding to the sewage prior to settlement a suitable chemical or mixture of chemicals with the object of coagulating colloidal matter and producing a flocculent precipitate which, as it settles, enmeshes and carries down the finely divided suspended matter and thus forms an adjunct to settlement. Optimum precipitation had been achieved with aluminum sulfate at pH 5.0 due to the formation of aluminum hydroxide by hydrolysis. In order to achieve good results, the pH had to be closely controlled. Rapid settlement of the precipitated matter was promoted by mechanical flocculation, regardless of what precipitant was used. Unless a sufficient dose of the chemical added is used, such treatment may not only be useless and expensive, but may actually hinder rather than assist purification. No significant precipitation occurs with aluminum sulfate unless a dose larger than 50 mg/liter is used. The precipitating effect of small doses of lime and acid may be more than offset by the suppression of the biological purification that would otherwise occur. The doses of precipitants which have been shown to be necessary for effective precipitation also give rise to the formation of bulky sludges, and the disposal of these is another factor to be considered. (Baker-FRC)

TREATMENT OF EFFLUENT WATERS CONTAINING CHLORIDES BY REVERSE OSMOSIS DYNAMICALLY FORMED MEMBRANES,

Kuwait Univ. Dept. of Chemical Engineering.
H. I. Shaban.
Journal of Environmental Science and Health, Part A, Vol 16, No 4, p 359-372, 1981. 6 Fig, 12 Ref.

Descriptors: *Chlorides, *Reverse osmosis, *Wastewater treatment, *Membranes, Semipermeable membranes, Salt rejection, Membrane filters, Lithium, Sodium, Magnesium, Feasibility studies.

Theories proposed for the semipermeability of membranes in the past have all been based on cellulose acetate membranes, which are currently used for the treatment of effluents. This study investigated the feasibility of using a new type of hydrous zirconium oxide dynamically formed membrane in the reverse osmosis process. A cell was constructed to accommodate the membrane. Various experiments conducted with solutions of sodium chloride, lithium chloride, and magnesium chloride were designed to investigate membrane surface density, pressure and feed concentration variations, the effects of solute rejections, and water permeation across the membranes. The hydrous zirconium oxide dynamically formed membranes were found to be reasonably successful in obtaining salt rejection for the solutions tested. Salt solutions were rejected according to their molecular weights. Pressure increases from 200 to 800 PSI resulted in increases in the permeation rate for the three salt solutions tested. MAIN COMPOUNDS BEHAVIOR IN KRAFT WASTES CLEANING BY ACID COAGULATION AND CARBON ADSORPTION,

Universidad Complutense de Madrid (Spain). Dept. de Quimica Industrial.
J. Aguado, J. J. Rodriguez, and J. Tijero.
Journal of Environmental Science and Health, Part A, Vol 16, No 4, p 405-418, 1981. 4 Fig, 1 Tab, 19 Ref.

Descriptors: *Pulp wastes, *Chemical coagulation, *Adsorption, Carbon, *Kraft mills, Industrial wastewater, *Wastewater treatment, Gels, Chromatography.

Kraft mill liquid wastes present many treatment problems and pose a significant threat to the environment. A treatment method developed by Vian and coworkers involves dividing kraft mill effluent into three waste streams based on their chemical compositions and treating the most problematic waste stream with acid coagulation at pH 4 followed by carbon adsorption. The waste stream, composed of wastewaters from the final steps of pulp washing, alkaline extractions from bleaching, and accidental black liquor overflows from the recovery section, includes lignin, alpha-cellulose and hemicellulose degradation products, and the remaining inorganics from white liquor. Acid coagulation reduces the concentration of lignin compounds considerably, but significant amounts of these compounds remain in solution. The precipitate from the coagulation treatment is comprised mostly of lignin compounds, with some adsorption of carbohydrates in the flocs. Partial acidolysis of large polymers occurs during either acid coagulation or redissolution with NaOH. Subsequent treatment by carbon adsorption drastically reduces the remaining lignin compounds, although carbohydrates are still present to some extent in the effluent from this treatment. Increasing the carbon dose results in substantially higher decreases in the final organic matter concentration. (Carroll-FRC)

THE EFFECT OF NITRIFICATION IN THE BOD TEST,

Anglian Water Authority, Peterborough (England). Peterborough Sewage Div.
P. G. Bird.
Water Pollution Control, Vol 80, No 3, p 378-389, 1981. 12 Fig, 2 Tab, 18 Ref.

Descriptors: *Nitrification, *Biological oxygen demand, Oxygen demand, Wastewater treatment, Water treatment facilities, Sludge, Bacteria, Acidity, Ammonia.

The five-day biological oxygen demand (BOD) test attempts to quantify the extent of the many different biochemical reactions which are taking place in the purification of water in a single test. In any BOD test, the basal oxygen demand will be provided by the oxidation of organic matter present by heterotrophic bacteria. However, contributions to the total oxygen demand may be expected from the oxidation of nitrogenous material by certain chemautotrophic bacteria; the magnitude of these contributions was investigated in this study. It was concluded that the extent of nitrification in the BOD test is dependent on the initial number of viable nitrifying bacteria. These bacteria will be associated with suspended particles in the sample. Nitrification proceeds more rapidly in the presence of suspended solids and heterotrophic bacteria. Under normal conditions, the difference between the normal BOD and the BOD(ATU) (allylthiourea) of the final effluent of a conventional biological filter sewage treatment plant can be small due to the long doubling period of the bacteria and the small number of viable nitrifying bacteria associated with the suspended solids. A partially nitrifying activated sludge sewage treatment plant will give large differences between the BOD and the BOD(ATU) due to the large number of viable nitrifying bacteria and the presence of significant amounts of ammonia. At periods during which the biological filter is sloughing off excessive growth, the difference would be high due to the large number of viable nitrifying bacteria associated with the suspended solids. The BOD test has been shown unsuitable for control purposes and unreliable when used for forecasting. The BOD test modified for suppressing nitrification is recommended for predicting the biochemical degradability of a sample.

DISPOSAL OF INDUSTRIAL EFFLUENTS - SOME FUTURE PROBLEMS,

Binnie and Partners, London (England).
G. E. Eden.
Water Science and Technology, Vol 13, No 7, p 337-346, 1981. 2 Fig, 2 Tab, 9 Ref.

Descriptors: *Wastewater treatment, *Industrial development, *Policy making, *Regulations, *Industrial wastewater, Environmental effects, Water resources development, Water quality management, Biological wastewater treatment, Environmental protection, Future planning, Industrial wastes, *United Kingdom.

In the United Kingdom, industrial effluents may be treated by individual industries before discharge into rivers or may be handled by local sewage treatment facilities. Organic materials of essentially natural origin and some synthetic organic materials may be handled by biological wastewater treatment processes. Toxic organics including pesticides and chlorinated solvents may be detrimental to biological sewage treatment operations and cause even greater problems when they appear in sludges. Inorganic compounds may be removed to some extent in the biological treatment of wastewater and also are present in sludges. National and international pressures are being exerted on the United Kingdom to change existing methods of waste water treatment. Some regional, national and international regulations that have been adopted as a result of these pressures are reviewed. The balance between environmental protection and the freedom to pollute is presently favoring the industrialists, who claim that too much restraint on industry will hamper manufacturing and economic prosperity. BEDDINGTON SEWAGE-TREATMENT WORKS, CANYON: SOME OPERATING EXPERIENCES 1969-79,

Thames Water Authority, London (England).
D. I. J. Booker.
Water Pollution Control, Vol 80, No 3, p 356-377, 1981. 3 Fig, 7 Tab, 6 Ref.

Descriptors: *Wastewater facilities, Administration, Operating costs, Management planning, Primary wastewater treatment, Wastewater treatment, *England, Thames Water Authority.

Significant effects that have occurred since October of 1969 in the operation of the Beddington Sewage Treatment Works at Croydon are reviewed. The originally planned tertiary treatment plant has not been constructed. Flows resulting from the proposed closures of Sutton and Wandle Valley works have not been diverted to Beddington. Under specific conditions, flows from the works pumphouse and a pumping station on arrival at the works inlet tend to dam-off the sewage which flows by gravity from central and southern Croydon, causing this flow to back up and overflow the inlet weir of the inverted siphon which is intended to bring in gravity storm flows. This situation has been temporarily corrected through the raising of the inlet weir using a Coplastic sheet attached to brickwork, pending a permanent alteration of the weir level. The control system, governing the operation of duty pumps and capable of variable speed to deliver sewage at varying rates, proved very unreliable. Modifications found necessary for the pumping station included a piped supply of effluent under pressure to enable the pumps to be flushed out prior to maintenance and the re-routing of the discharge pipework from the sump of the dry well. The greatest changes since beginning operation have occurred in the sludge treatment and disposal system. A program of emptying and cleaning the digesters was begun in 1969-70, as they had not been cleaned out since start-up in 1936. An entirely new digestion plant was constructed. The new digesters operate on a draw and fill basis by remote control. Each tank was equipped with bubble guns for heating and mixing. These have not functioned well, as they frequently become blocked. Specific problems are also noted in the aeration plant, return-sludge pumping, final sedimentation, effluent recirculation, air supply and power generation.

UPWARD FLOW CLARIFICATION OF SECONDARY SEWAGE EFFLUENT USING LIME,

Portsmouth Polytechnic (England).
R. Irwin, B. A. Winfield, and P. A. Stead.
Effluent and Water Treatment Journal, Vol 20, No 5, p 222, 224, May, 1980. 1 Fig, 1 Tab, 3 Ref.

Descriptors: *Lime, *Clarifiers, *Wastewater treatment, Coagulation, Sedimentation, Tertiary wastewater treatment.

Lime coagulation in an upward flow, hopper-bottomed clarification unit was used to polish secondary effluents. The clarifier has a surface area of 1.56 sq meters and an overall depth of 2.13 meters. Lime is injected as a 0.1-1.0% calcium hydroxide suspension and forms a calcium carbonate floc. Suspended particles and other material are trapped as the water flows upward through the floc blanket. The continuously operating unit allows water to be drawn out at the top by a series of V-notched launders. Under almost all operating conditions studied, this clarification process removed twice as much BOD, suspended solids, and turbidity as did a normal sedimentation unit treating the same liquid. At lime doses of 100 mg per liter, up to 75% soluble P and 99% of coliforms were removed. Advantages of the process are small sludge volume, smaller tank volume, better effluent quality, and higher hydraulic loadings per unit surface area. (Cassar-FRC)
W82-02413

APPLICATION OF THE EXPANDED BED TECHNIQUE FOR THE DENITRIFICATION OF A SEWAGE EFFLUENT,

Thames Water Authority, London (England).
J. E. Hawkins, D. A. Stott, R. L. Stokes, and C. Clennett.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 4, p 361-373, July, 1980. 5 Fig, 3 Tab, 10 Ref.

Descriptors: Sewage treatment, *Denitrification, *Industrial wastes, *Flow discharge, *Streams, Nitrates, Runoff, Seasonal variation, Dilution, Hydrologic data, Oxidation, Fluidized bed process, *Wastewater treatment, Chemical analysis, Water pollution, Filtered wastewater.

The feasibility of using an expanded bed filter for denitrification of sewage effluent on a full scale is demonstrated. On the average the filter removed over 50 percent of the nitrate from a flow of 9000 m3 per day. The average rate of denitrification was 3.6 kilograms per cubic meter filter bed per day, while the average ratio of the weights of methanol consumed to nitrate removed was approximately

2.5:1. There were no significant instances of pollution of the river Lee due to the discharge of methanol from the works. The washing of the filter bed had to be carefully controlled to prevent clogging yet avoid excessive loss of biomass. (Titus-PRC)

AN EXPERIMENTAL PROJECT TO DETERMINE THE PARAMETERS OF SILICA SCALING IN REVERSE OSMOSIS SYSTEMS,

Coury and Associates, Inc., Lakewood, CO.
M. C. Mickley, and W. M. Straley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157942, Price codes: A05 in paper copy, A01 in microfiche. Technical Completion Report, 1981. 75 p, 30 Fig, 4 Tab. OWRT-C-90169-S(9526)(1), 14-34-0001-9526.

Descriptors: *Silica, *Scaling, *Reverse osmosis, Chemistry of precipitation, Metal complexes, *Silica scaling, Silica chemistry, Membrane scaling, Reverse osmosis systems, Silica solubility, Scaling mechanism kinetics, Silica precipitation, Silica supersaturation, Colloidal scaling, Silica complexing.

The objective of this work was to better define, on the basis of literature research and laboratory experiments in glassware and small reverse osmosis systems, how various parameters affect the concentration limits at which silica scaling occurs, and what the mechanisms of scaling are. The specific parameters studied were silica supersaturation, temperature, pH, and brine composition and concentration. Silica chemistry was found to be extremely complex, involving several different silica species and several mechanisms for removal of silica from solution. In addition, a wide variety of parameters were found to have effects on silica scaling, by affecting solubility, scaling mechanism, the kinetics of the mechanism, or a combination of these. This report provides a conceptual model of the types of silica scaling which may occur, and the situations in which they may occur, and presents experimental data consistent with the model.

EVALUATION OF MEMBRANE PROCESSES AND THEIR ROLE IN WASTEWATER RECLAMATION: VOLUME II,

Orange County Water District, Fountain Valley, CA.
D. G. Argo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-158007, Price codes: A12 in paper copy, A01 in microfiche. Report prepared for Office of Water Research and Technology, November 30, 1980. 255 p. OWRT-C-80159-R(852[illegible]3), 14-34-0001-8520.

Descriptors: *Advanced wastewater treatment, *Wastewater renovation, *Water reuse, Reverse osmosis, Electrodialysis, Ultrafiltration, Ozonation, Costs, Water Factory 21, *Orange County Water District, California.

Water Factory 21 (WF-21) in Orange County, California, is a 15-mgd advanced wastewater treatment (AWT) plant designed to reclaim biologically treated municipal wastewater for injection into a seawater barrier system. Processes included are lime treatment, air stripping, filtration, activated carbon adsorption, reverse osmosis (RO), and chlorination. This study was undertaken because of increasing interest in use of reclaimed water to augment domestic water supplies. This report presents operating data from WF-21 collected during the second year of a three-year project. The effectiveness of each treatment process is presented, with emphasis on several AWT processes, including RO demineralization, ozone and biologically activated carbon, ultrafiltration, and electrodialysis. The data collected show that the combined processes, including RO, used at WF-21 are capable of producing a very high quality water. Treatment reduced all contaminants, with a very high degree of reliability, to levels below national interim primary drinking water regulation maximum contaminant levels. It was found that lime clarified secondary effluent can be used as feedwater to a RO demineralizer. This lime/RO process substantially reduces the pretreatment requirements and cost of reclamation. Experiments with new low pressure membranes (250 psi) show great potential for reducing RO costs. Pilot studies showed the membrane to be stable and not subject to rapid deterioration. The cost of AWT at WF-21 is $1,038 per million gallons. The cost of RO demineralization is $819 per million gallons. These costs include all operation and maintenance as well as amortization of capital.

Rapid growth and development in coastal North Carolina, particularly as related to tourism and the building of second homes, have done serious damage to the aquatic environment. To assess options for sound wastewater management, two areas were selected for study: the Dare County area in the north, and the Carteret County area, with a small portion of Onslow County, in the south. The options examined were (1) discharge to inland coastal waters, (2) disposal on the land, and (3) discharge to the ocean. Ocean outfalls were found to be the best option because they exhibited economies of scale. Not only would disposal to inland waters be more costly than ocean disposal, but it would also pose a threat to shellfish growing areas. Land disposal is relatively safe, as long as care is taken to avoid contamination of potable water wells. Despite the high cost of sewerage for ocean disposal, this option is generally less costly than the others. Ocean disposal for the northern area can conveniently and economically serve the entire population. In the southern area, the mainland communities are so located that the most economical solution is a combination of an ocean outfall with land disposal for the inland communities. However, adequate data on the drift of wastewater with the currents and the dispersion of wastewaters in the offshore waters is not available. Length of outfalls and depths to place outfall dispersers must be conservatively determined. The report addresses issues of implementation and legal issues to be resolved. (Garrison-Omniplan)

SOME ECONOMIC IMPACTS OF FRESHWATER STREAM EFFLUENT DISCHARGE LIMITS ON SELECTED SMALL COMMUNITIES IN MISSISSIPPI,

Mississippi State Univ., Mississippi State. Div. of Business Research.
L. R. Cheatham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157835, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Institute, Mississippi State University Report, September, 1981. 115 p, 27 Tab, 18 Ref. OWRT-A-131-MISS(1), 14-34-0001-1126.

Descriptors: *Federal Water Pollution Control Act, *Pollution abatement, Wastewater pollution, *Water pollution control, Water pollution sources, *Capital costs, Operating costs, Construction costs, Effluent streams, Industrial effluents, Sewage effluents, *Wastewater treatment, Secondary treatment, Pre-treatment, Sewage systems, *Mississippi, Effluent discharge limits, Regulations compliance costs, Public Law 92-500, Industrial profitability, Compliance impacts, Water pollution abatement regulations.

Wastewater effluent discharge limitations in Mississippi implemented under authority of Public Law 92-500 and other legislation, in general, have not produced compliance costs of a sufficient magnitude to affect the levels of employment, income, and output of the classifications of manufacturing firms incurring the largest costs. Capital expenditures for water pollution abatement, however, have been large enough to present a potential source for problems in selected firms in SIC groups 20, 22, 24, 25, 26, 28, 29, 30, 33 and 34. Firms in which compliance costs are most likely to affect profitability comprise only 3% of the state's manufacturing firms yet supply 10% of manufacturing employment and 15% of payrolls. Operating costs which result from compliance activities are far more significant to profitability than costs of compliance equipment. Compliance costs incurred by public sewage disposal systems in the state are having a much greater economic impact than industrial compliance costs. The most obvious effect is in the form of increases in system user rates. One reason regulations have not had more impact on industry is that over 90% are discharging some wastewater through public systems. Over 41% of surveyed system managers reported average household bills had already increased 100% or more because of construction costs and increases in operating costs.

WASTEWATER COLLECTION AND TREATMENT IN WAYNE COUNTY,

Wayne County Board of Public Works, MI.
R. E. Smith.
Water/Engineering and Management, Vol 128, No 9, p 41-42, 44, September, 1981.

Descriptors: *Rural areas, *Drains, *Wastewater facilities, *Costs, Wastewater treatment, Secondary wastewater treatment, Interceptor sewers, Flood control, Project planning, Administration, Financing, *Wayne County, Michigan.

As population shifted from the city of Detroit to rural areas, Wayne County, as suburb of Detroit, had to establish drainage districts to solve the sewerage problems of the new commjnities. Major projects which have been completed or are under construction include six drain projects and one treatment plant. These and other projects being handled under the supervision of the Wayne County Drain Commissioner's Office will cost a total of $270 million. Projects to prevent flooding are especially needed in the western, southeastern and downriver sections of the county. The estimated cost of all proposed projects is about $325 million. Community financing of such large projects is discussed. Cooperation between the Wayne County Drain Commissioner's Office, the Wayne county Department of Public Works and the Detroit Water and Sewerage Department helps in the managementof rural waste water problems. The Department of Public Works must remove three satellite plants from the Huron river and provide a facility for primary and secondary treatment to serve the growing populations of western and southern Wayne County. A 40 mgd waste water treatment plant is set to be constructed at the mouth of the Huron River. An interceptor to serve this facility will cost an estimated $250 million. Users should be assessed fees to assure that funds

are available to replace entire projects when their useful life has been exhausted. (Geiger-FRC)

ALGAL POLYMORPHISM IN HIGH RATE WASTEWATER TREATMENT PONDS,

Technion - Israel Inst. of Tech., Haifa. Environmental and Water Resources Engineering.
G. Oron, G. Shelef, and A. Levi.
Hydrobiologia, Vol 77, No 2, p 167-175, 1981. 2 Fig, 6 Tab, 26 Ref.

Descriptors: *Algae, *Wastewater lagoons, *Morphology, Wastewater treatment, Organic loading, Aeration ponds, Nutrients.

Two main algal species (Scenedesmus dimorphus and Micractinum) were found in high rate algae ponds used for wastewater treatment, effluent reclamation, and protein production. The external changes observed over a 3-year period were morphological, not species changes. These changes (colony separation, loss of setae, various types of aggregation, and changes in chloroplast distribution in the cells) were responses to variations in climate and operating regime, such as organic loading, retention time, aeration, mixing, radiation, ambient temperature, and effluent depth. Four forms of S. dimorphus were identified at different times: regular or classic, single cell (spring and summer), pseudo S. obliquus (late winter and early spring under overloaded conditions), and rounded single cell (under extended overload conditions). Micractinum also showed four forms: regular or classic M. pusillum and M. quadrisetum, floccy M. pusillum (under underloading conditions and nutrient shortage), and single cell M. pusillum (during overload conditions). INFLUENCE OF DISSOLVED OXYGEN ON ACTIVATED SLUDGE VIABILITY,

Oregon State Univ., Corvallis. Dept. of Civil Engineering.
K. J. Williamson, and P. O. Nelson.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1533-1540, October, 1981. 6 Fig, 26 Ref.

Descriptors: *Biological wastewater treatment, *Model studies, *Dissolved oxygen, *Activated sludge, Wastewater treatment, Suspended solids, Sludge, Microorganisms, Mixed liquor solids, Volatile solids, Biological oxygen demand, Organic loading.

The specific viability of microorganisms in laboratory air and oxygen systems was measured by ATP methods to determine whether oxygen limitation occurs inside activated sludge flocs. Results of three separate experiments showed that increased dissolved oxygen (DO) levels of up to about 15 milligrams/liter in activated sludge yielded increases in viability, probably due to DO limitations inside flocs, changes in organism metabolism, or other factors. Increased viability can cause higher allowable food:microorganism (F:M) loadings while maintaining equal degrees of treatment if the F:M is determined from total volatile suspended solid levels and steady state solid retention times are greater than one day. At equal F:M ratios, the systems with greater viability will show significantly lower effluent substrate levels only at very short solid state retention times. At higher DO levels with increased endogenous respiration, lower sludge production occurs in activated sludge systems. A model of the activated sludge process which contains a nonviable component of the TVSS is presented. This can predict observed differences in ATP viability, allowable F:M loadings, and sludge production between air and oxygen systems. (Geiger-FRC)

CONCEPTS IN AQUATIC TREATMENT SYSTEM DESIGN,

Dewante and Stowell, Sacramento, CA.
R. Stowell, R. Ludwig, J. Colt, and G. Tchobanoglous.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 919-940, October, 1981. 5 Fig, 6 Tab, 45 Ref.

Descriptors: *Nutrient removal, *Wetlands, *Aquatic plants, *Wastewater treatment, Reviews, Nitrogen, Phosphorus, Aquatic animals, Aquatic environment, Biological oxygen demand, Effluents, Design criteria, Suspended solids, Bacteria, Viruses, Heavy metals, Organic compounds.

The present status of aquatic treatment systems (untreated wastewater applied to natural or man-made wetlands) is reviewed with respect to machanisms and design. These systems are slower in action, use more land area, and are more subject to environmental influences than conventional treatment. A conceptual model for an aquatic processing unit is described. This combines plants (floating, emergent, and/or submerged) and animals (zooplankton and certain fish). Plant harvesting removes nutrients. Other factors to consider are climate (temperature, winds, and rain), unfavorable environmental effects (odor, fog, and disease), wastewater characteristics, and process reliability. Published data from 24 observations of operating aquatic treatment systems are presented. Generally, 80% of BOD can be removed at loading rates of 100 lb per acre per day. There should be about 8 inches of clear water between the root zone of floating plants and settled matter on the bottom. For emergent plants, water depth should be about 3 feet or less. The data available to date is insufficient to develop design criteria. Pilot plant tests and other investigative studies are necessary before any full-scale system is constructed. (Cassar-FRC)

THIOCYANATE BIO-OXIDATION KINETICS,

Pittsburgh Univ., PA. Dept. of Civil Engineering.
R. D. Neufeld, L. Mattson, and P. Lubon.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE-5, p 1035-1049, October, 1981. 11 Fig, 1 Tab, 21 Ref.

Descriptors: *Thiocyanates, *Kinetics, *Wastewater treatment, *Coal gasification, Industrial wastewater, Aerobic treatment, Nitrogen compounds, Sulfur compounds, Ammonia, Sulfates, Biodegradation, Degradation, Activated sludge process, Biological treatment, Water pollution control.

A kinetic expression and material balance for nitrogen and sulfur was developed for biological degradation of thiocyanates in coal conversion process wastewaters. Batch and continuous culture experiments using an activated sludge system and thiocyanate-specific organisms showed that the specific utilization rate for thiocyanate degradation followed a substrate inhibition biokinetic relationship. The rate rose with increasing thiocyanate level to a maximum at about 470 mg per liter and decreased with a further increase in thiocyanate level. Critical sludge age was 4.14 days. Biodegradation of thiocyanate produced sulfate and ammonia. Thiocyanate removal at concentrations up to 1000 mg per liter was virtually complete in continuous culture systems at pH 5-7, but was poor at pH 8. (Cassar-FRC)

5E. Ultimate Disposal Of Wastes

ECONOMIC AND TECHNICAL EVALUATIONS OF SWINE MANURE MANAGEMENT SYSTEMS WHICH USE LAND APPLICATIONS,

North Carolina State Univ. at Raleigh. Dept. of Economics and Business.
R. G. Drynan, J. C. Williamson, P. W. Westerman, and S. R. Crane.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153727, Price codes: A09 in paper copy, A01 in microfiche. Water Resource Research Institute, University of North Carolina, Report No 173, September, 1981. 174 p, 15 Fig, 62 Tab, 20 Ref. OWRT-A-098-NC(1), 14-34-0001-8035.

Descriptors: Agricultural wastes, *Animal wastes, Farm wastes, Economic evaluation, Land disposal, Waste management, Costs, *Cost analysis, *Land application, Agriculture, Hogs, *Manure, *Swine waste, Manure management alternatives, Least-cost system.

The trend towards more and larger confinement swine production operations has meant that larger quantities of localized manure have to be dissipated in cost-efficient and environmentally acceptable ways. Land application of the manure to agricultural crops represents an excellent manure utilization scheme as well as sound environmental management when application rates are based on crop nutrient requirements. Evaluations of which manure management alternatives for storage, treatment, handling and land applications are best for particular situations depend upon several factors, such as ease of management, labor constraints, capital available, land and crops available, and environmental considerations. Collection of waste management technical data and evaluation of the economics of the various feasible alternative manure management systems were the major objectives of this project. In this study, the major facilities, treatment, and land application options for liquid swine manure were identified and investment and operating costs were estimated. A mathematical integer linear programming model was developed to estimate costs of manure management systems and to determine which of the systems was the optimal or least-cost system. Also, subsidiary models were developed to compute various technical and cost coefficients for use in the main model. Examples include the model for calculating the time and labor requirements for spreading liquid manure with a tank wagon, and the model for determining the nutrients made available by manure applications at various times and rates.

SURFACE WATER HYDROLOGIC CRITERIA FOR URANIUM MINE TAILINGS IMPOUNDMENTS IN ONTARIO,

MacLaren (James F.) Ltd., Willowdale (Ontario).
C. T. Bishop, and R. Bishop.
Canadian Journal of Civil Engineering, Vol 8, No 3, p 364-369, September, 1981. 1 Fig, 3 Tab, 11 Ref.

Descriptors: *Impoundments, *Design criteria, Uranium, *Radioactive wastes, Mine wastes, Mine drainage, Flood control, *Ontario.

The selection and implementation of surface water hydrologic criteria related to uranium tailings impoundments in Ontario were investigated. The mining and milling of uranium produces large quantities of low level radioactively contaminated waste rock, tailings, and process water. Regulatory agencies have set water quality standards for water discharged from tailings basins in Ontario. A closely monitored constituent of water from uranium tailings basins is radium. The existing hydrologic criteria for tailings impoundments in Ontario are rather vague. Existing guidelines do not stipulate a hydrologic criterion for the design of an emergency spillway specifically for this type of impoundment. Hydrologic criteria for such impoundments should be a function of the economic and environmental consequences of a failure. A guideline based on risk recognizes explicitly that a design flood of given return period bears a specific probability of beng equalled or exceeded during the service life of the mine. Hydrologic analysis of a tailings impoundment must determine values for the following parameters: the design treatment rate, the crest elevation of the emergency spillway, and the crest evaluation of other perimeter structures. The impoundment should be able to store and susequently treat all the runoff from the regional storms. The impoundment should be equipped with a spillway capable of passing the runoff from the probable maximum precipitation, assuming the water level prior to the storm to be equal to the mean annual level. (Baker-FRC)

MANAGING HAZARDOUS WASTES,

Weston (Roy F.), Inc., West Chester, PA.
P. B. Lederman, and M. D. LaGrega.
Industrial Wastes, Vol 27, No 5, p 36-38, 40, September/October, 1981. 2 Fig, 3 Tab.

Descriptors: *Water pollution prevention, *Landfills, *Waste management, Leachates, *Hazardous materials, Incineration, *Waste disposal, Solid waste disposal, Waste burial, Waste dumps, Chemical wastes, Industrial wastes, Organic wastes, Organic compounds, Land disposal.

Several methods of hazardous waste disposal are available for the interim period until the gap between waste disposal technology and new product development is narrowed. Landfills, land farming, and incineration are in widespread use in both acceptable and nonacceptable forms. Proper landfilling includes leachate management and monitoring, separation of noncompatible wastes, proper site selection (never penetrating an aquifer, and preferably not over a drinking water aquifer), and solidification of liquid wastes. Ordinary incinerators do not provide the 3-5 sec residence time and 2000 F temperatures necessary for complete waste destruction. Several good incineration systems are available: horizontal incinerators, multiple hearth, and rotary kiln. Land farming of wastes is successful if the site is actively plowed and not overloaded with respect to the material being dumped. The potential for groundwater contamination must be minimized by runoff control. Other methods of waste disposal in more limited use include waste reduction by modifying the manufacturing process, volume reduction of wastes (segregation of the most hazardous wastes from the innocuous material and concentration of liquids), chemical detoxification, and chemical destruction (hydrocarbons and chlorinated hydrocarbons). (Cassar-FRC)

INDUSTRIAL WASTEWATER PRETREATMENT SERVICE,

Chem-Clear, Inc., Wayne, PA.
J. K. Wittle, and B. W. Dunkel.
Industrial Wastes, Vol 27, No 5, p 46-49, September/October, 1981. 1 Fig, 2 Tab.

Descriptors: *Industrial wastewater, *Chemical wastewater, Wastewater treatment, Organic compounds, Chem-Clear Inc., Phenols, Chromium, Cyanide, *Wastewater disposal.

Chem-Clear, Inc., operates four regional facilities for pretreating liquid industrial wastes prior to disposal to sewers or landfills and detoxifies materials such as cyanide, hexavalent Cr, phenols, acids, and bases. There are six basic steps in the process: analysis of raw waste, primary settling, mixing and blending, chemical treatment, and dewatering/discharge. Safety precautions include earthen berms to isolate tank spills, large capacity emergency gasoline driven portable pumps, and treatment of floor spills. Pickling liquors and strong acids are neutralized. Cyanide is oxidized to the cyanate, which is further decomposed to CO2 and ammonia. Hexavalent Cr wastes are acidified and reduced to the trivalent state. Phenolic wastes are oxidized. The various pretreated wastes are combined for a chemical treatment which occurs in seven individual compartments. Realting sludge is dewatered in a filter press and landfilled. Clarified effluent is discharged to the municipal sewer system according to the effluent limitations and hours specified by the local sewer district. Waters containing the following materials are not accepted for treatment: pesticides, insecticides, polychlorinated biphenyls, and PBB's. (Cassar-FRC)

ANALYSIS OF ROCK STRESS AROUND A LIQUID WASTE INJECTION SYSTEM IN ILLINOIS,

Kansas Univ., Lawrence.
M. Heidari, and K. Cartwright.
Water Resources Bulletin, Vol 17, No 4, p 614-622, August, 1981. 6 Fig, 15 Ref.

Descriptors: *Injection wells, *Underground waste disposal, *Stress analysis, Stress, Rocks, Aquitards, Aquifer management, Water quality, Mathematical studies, Hydraulic fracturing.

A simple analytical solution to the transport equation was used to investigate the injection of liquid industrial wastes into deep subsurface formations. The problem of lateral movement of injected fluid due to dispersion, diffusion, and convection was investigated, and dispersion and diffusion were found to be of minor importance. Convection was the major transporting agent, and its effects can only be evaluated after a long period of injection. Stress distribution in the vicinity of the well may be the cause of hydraulic fracturing of the aquitards, which would threaten aquifers containing potable water. A disposal well in Putnam County, Illinois, was simulated to demonstrate stress around the well, and stress was found to be below the danger point after long, continuous injection. (Small-FRC)

PVC COVER CAUSES LEACHATE RETREAT,

SMC-Martin, King of Prussia, PA.
G. H. Emrich.
American City and County, Vol 96, No 10, p 61-62, October, 1981. 2 Fig.

Descriptors: *Groundwater pollution, *Water pollution control, Water pollution sources, Plumes, Landfills, Waste dumps, Leachates.

Groundwater was contaminated by leachate from an illegal dump in the area of Windham, Connecticut. Further downgradient and threatened by the leachate was the reservoir that supplied drinking water to portions of the town of Windham, as well as to the entire city of Willimantic, which lay within the town boundaries. The state ordered the landfill closed, and an infiltration-preventing closure was to be designed. Regrading was done such that runoff from the surface of the hill was maximized and a minimum of about a foot of material was left atop all wastes. Atop the native soil was placed a minimum of four inches of washed fine sand. The entire top of the landfill was next covered with a 20-mil layer of polyvinyl chloride. Groundwater samples were collected and the specific conductivities determined before and after application of the seal. According to the initial conductivity contour map, a major contamination plume was moving toward the reservoir. One year after seal placement, measurements showed that the plume had receded. EFFECT OF THE EARTHWORM, EISENIA FOETIDA (OLIGOCHAETA), ON FLUXES OF VOLATILE CARBON AND SULFUR COMPOUNDS FROM SEWAGE SLUDGE,

Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
S. G. Hornor, and M. J. Mitchell.
Soil Biology and Biochemistry, Vol 13, No 5, p 367-373, 1981. 2 Fig, 3 Tab, 33 Ref.

Descriptors: *Activated sludge, *Decomposition, *Oligochaetes, Sludge disposal, Land application, Sulfur compounds, Macroinvertebrates, *Earthworms, Bacteria, Anaerobic bacteria, Methane bacteria, Odor control, Aerobic treatment, Biodegradation, Organic compounds, Nitrogen compounds, Hydrogen sulfide, Sulfides, Feces, Moisture content, Soil amendments, Mineralization.

Activated sludge was fed to earthworms, Eisenia foetida, to determine the effects on aerobic decomposition. Rates of decomposition were measured by flux rates of gases in undigested and digested sludge. Feces always showed higher fluxes of CO2 and O2 and lower fluxes of methane, H2S CH3SH, and (CH3) 2S than undigested sludge, indicating that earthworm feeding stimulated aerobic decomposition of sludge. Gas flux rates for CO2 and O2 in both sludge and feces were directly proportional to their moisture content. Methanogenesis never accounted for more than 0.06% of the gas atmosphere, an indication of aerobic respiration. Volatile sulfur accounted for 0.02-0.08% of total S present. CH3SH and (CH3) 2S evaluation from feces were significantly correlated with moisture content. H2S accounted for 97-100% of total evolved S from sludge and a lesser percentage from feces. Earthworm feeding or moisture content did not affect populations of total anaerobes, nitrate reducers, sulfate reducers, and methanogens. Malodorous S compounds were less noticeable when feeding earthworms partially dried sludge, but sludge of > 3:1 moisture to dry weight ratio could stimulate volatile S production. (Cassar-FRC)

AN INVESTIGATION OF THE INFLUENCE OF BACTERIOPHAGES ON THE BACTERIAL FLORA AND PURIFICATION POWERS OF ACTIVATED SLUDGE,

Kyushu Univ., Fukuoka (Japan). Dept. of Agricultural Chemistry.
S. Ogata, H. Miyamoto, and S. Hayashida.
Journal of General and Applied Microbiology, Vol 26, No 2, p 97-108, April, 1980. 8 Fig, 3 Tab, 9 Ref.

Descriptors: *Activated sludge, *Bacteria, *Biochemical oxygen demand, *Seasonal variation, *Sewage, Bacteriophage, Incubation, Temperature effects, Air temperature, Sedimentation rates, Viruses, Morphology, *Wastewater disposal.

Bacteriophages in the activated sludge of a public sewage disposal plant were isolated, and the influence of the phages on the bacterial flora and the purification powers and sludge volume index of the sludge were examined. Two groups of dominant bacteria were isolated during a 30 month investigation. At the time of the isolation, a disturbance in the normal bacterial flora was observed. Such disturbance was considered to cause a decrease in the purification powers. The disturbances occurred in spring and autumn, and may be caused by phage infection. (Titus-FRC)

THE DESIGN OF SEA OUTFALLS WITH REFERENCE TO EEC AMENITY WATER POLLUTION CRITERIA,

Dundee Univ. (Scotland). Dept. of Civil Engineering.
J. A. Charlton.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 1, p 33-41, January, 1980. 5 Fig, 1 Tab, 5 Ref.

Descriptors: *Seawater, *Water pollution, *Outfalls, *Effluent limitations, *Beaches, Design criteria, Wastewater outfall, Outfall sewers, Bacteria, Sewage, Water quality, Tidal effects, Environmental effects, Coastal waters, Turbulence, Dispersion, Swimming, Public health, Great Britain, Europe.

Water quality criteria for bathing waters are discussed. The criteria were established by the European Economic Community (EEC), and are intended for use in the design of sea sewer outfalls. Meteorological data are analyzed to determine threshold wind conditions corresponding to the exceedance percentage. In situ current and dispersion studies are then used to establish dilution rates and normal boundaries, which are then wind shifted to their limiting position. These boundaries must remain clear of the bathing area for the outfall design to be acceptable. Additional precautions are recommended for the discharge of industrial effluents. (Titus-FRC)

TREATED PIT FLUIDS MEET WATER SPECIFICATIONS,

Oil and Gas Journal, Vol 78, No 48 p 138-139, December 1, 1980.

Descriptors: *Pit recharge, *Drilling fluids, Wastewater treatment, *Drilling, Clarifiers, Industrial wastes, *Waste disposal.

The need to haul reserve pit fluids used in land drilling and workover operations to another location in a vacuum truck or find a suitable subsurface disposal site can be eliminated through the chemical and mechanical treatment of the fluids. Treatment is practical during drilling or after the rig moves off location. After treatment the fluids to meet water quality standards, the effluent can be discharged into surface waters or natural drainage. Remaining solids are backfilled or buried for disposal. Most jobs have certain common characteristics. The average pit has 20,000 to 30,000 bbl of effluent, of which 60-90% can be discharged. Pits included contaminated rain water, wash down and drilling wastes. The least expensive treatment of this type to date costs 10 cents/bbl, and the most expensive costs $1/bbl. Average treatment cost is in the range of 40-50 cents/bbl. The customer is charged only for the clean water measured upon discharge. The average job requires about 3 days. The bioassay for water quality involves placing 12 medium tolerant bait fish in a 100% concentration of the treated effluent for at least 24 hr. If 70% survive, discharge is allowed at a specific rate. Equipment needed includes large centrifugal pumps for transferring water, chemical mixing tanks with 1,000-2,000 gal capacity, and chemical lines and hoses. Clarifiers and centrifuges are used for extremely tough jobs. (Baker-FRC)

SLUDGE: BACK INTO THE OCEAN,

D. V. Feliciano.
Journal of the Water Pollution Control Federation, Vol 53, No 10, p 1442-1446, October, 1981.

Descriptors: *Sludge disposal, *Ocean dumping, *Legal aspects, *Environmental effects, Wastewater treatment, Wastewater disposal, Waste disposal, Land disposal, Outlets, Waste management, Recycling, Waste recovery, Permits, Jurisdiction, Regulations, Water pollution effects, Ecological effects.

The issue of the ocean dumping of sludge has been reviewed by the U.S. courts. Much overlap exists when regulating the ocean dumping of wastes; the principal legislation is included under the Marine Protection, Research, and Sanctuaries Act (MPRSA), the Federal Water Pollution Control Act (FWPCA), and regulations of the Army Corps of Engineers, EPA, and the National Oceanic and Atmospheric Administration (NOAA). The production of waste water sludge by the nation's publicly owned treatment works is expected to nearly double by 1990. The role of the MPRSA, the politics of ocean dumping, and some environmental effects of ocean dumping are considered. NOAA has extensively studied the New York Bight in connection with ocean dumping and favors ocean dumping of sludge only when it is the most favorable option. The advisory committee to this agency supports the reuse and recycling of wastes as a priority goal for sludge disposal. Two cases which came up in court concerning the EPA regulations and ocean dumping are examined. In June of 1981, President Reagan authorized increased research on ocean dumping under MPRSA. NOAA intends to sponsor with EPA projects that will assess the relative risks posed to the environment by various ocean dumping options and develop new strategies for ocean dumping. (Geiger-FRC)

CHEMICAL PRETREATMENT FOR ACTIVATED-CARBON ADSORPTION,

Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
S. J. Randtke, and C. P. Jepsen.
Journal of the American Water Works Association, Vol 73, No 8, p 411-419, August, 1981. 17 Fig, 3 Tab, 36 Ref.

Descriptors: *Water treatment, *Activated carbon, *Adsorption, Water treatment facilities, Drinking water, Potable water, Coagulation, Chemical coagulation, Groundwater, Fulvic acids.

A research project was undertaken to investigate the removal of organic contaminants by coagulation and softening and to explore the interactions of these processes with subsequent activated-carbon adsorption. The results of this project are reported as they relate to the removal of organic contaminants by metal-salt coagulation and the effects of coagulation and softening on activated-carbon adsorption. Five sources of organic matter were used: a local groundwater supply, a humic acid, and three preparations of fulvic acid. The effectiveness of the removal process was related to the dosage of coagulant relative to the amount of organic matter present, the inorganic composition of the water, and the type of organic matter present. The predominant mechanism for organic matter removal by coagulation appeared to be the precipitation of insoluble organo-aluminum complexes. Pretreatment by coagulation significantly increased the adsorptive capacity of activated carbon for the remaining total organic carbon, except when little or no total organic carbon removal occurred during the coagulation process. This increase was not an artifact, but was primarily the result of an interaction between aluminum species and the organic molecules. A minor portion of the increase was attributable to a decrease in the initial total organic carbon concentration for the adsorption process. Neither coagulation nor softening preferentially removed either strongly adsorbing or weakly adsorbing organic molecules. (Baker-FRC)

NEW JERSEY COMMUNITY DECONTAMINATES WELL WATER.

Water Well Journal, Vol 35, No 9, p 58-59, September, 1981.

Descriptors: *Well water, *Decontamination, Adsorbents, Carbon, Water treatment facilities, Organic compounds, *Industrial wastes, Activated carbon, Potable water, Groundwater pollution, Trichloroethylene, Tetrachloroethylene, *Rockaway Township, *New Jersey.

Rockaway Township discovered in the fall of 1980 that all three of its public wells were contaminated with hazardous organic chemicals. A granular activated carbon system was installed in November of 1980 to treat its groundwater. Tetrachlorethylene was found in the groundwater pumped from all three wells. Well number 1 had levels as high as 650 ppb. Another well was also contaminated with 40ppb trichlorethylene. Granular activated carbon removes dissolved organic pollutants from water by a process of adsorption. As water passes through the porous granules of activated carbon, molecules of the organic pollutants are attracted to the surface of the pores and are held there by weak physical forces. The ability of granular activated carbon to remove large quantities of organic impurities is a function of its highly developed internal pore structure, which is created during the manufacturing process. A single handful of activated carbon has a total surface area equal to that of a football field. After the carbon has adsorbed all it can, it is reactivated through treatment in a multiple-hearth furnace. The organic impurities are burned from the internal surfaces of the individual carbon granules. More than 90% of the original carbon is recovered in the reactivation process. Rockaway Borough has also received cooperation from the state in attempting to locate the source of the contamination. (Baker-FRC)

SEASONAL EVALUATION OF ORGANICS REMOVAL AT A CONVENTIONAL WATER TREATMENT PLANT,

CH2M Hill, Reston, VA.
B. Gong, and J. K. Edzwald.
Aqua, No 4, p 0300-0304, 1981. 12 Fig, 4 Tab, 2 Ref.

Descriptors: *Water treatment facilities, *Seasonal variation, Organic compounds, Trihalomethanes, *Organic matter, Rivers, Grasse River, Raw water.

The seasonal variation of organic matter and trihalomethane (THM) precursors were studied in a raw river water supply. Seasonal performance of a conventional water treatment plant was also investigated with regard to the removal of organic matter and THM precursors. The correlations between terminal total trihalomethanes (Term-TTHMs) and surrogate parameters such as non-volatile total organic carbon, UV, absorbance, and color were also investigated. The water supply studied was the Grasse River at Canton, New York. The River is characterized by low turbidity, low alkalinity, and colored surface water. Raw water was collected on nine occasions between January 1980 and October 1980. Process samples were collected at five locations from the Canton water treatment plant. A definite seasonal trend in organic matter and THM precursors was noted in samples taken from the Grasse River. The lowest concentrations for non-volatile total organic carbon and TTHM formation potentials occurred in the winter when the river was covered with ice. The highest concentrations were noted in late July and August. The Canton water treatment plant was found to be performing well with regard to removal of non-volatile total organic carbon and THM precursors, with average removals of 66 and 68% being noted. The Canton plant uses alum coagulation with a nonionic polymer to aid floc formation. Pre-chlorination is practiced. An important characteristic of the plant is the short hydraulic detention time through the treatment plant, which is about 1 hr. This allows THM precursors to be removed prior to THM formation. Apparent color proved to be a gross measure of naturally occurring organic material in rivers. It also had good correlation with Term-TTHMs. (Baker-FRC)

SPECIFIC ORGANIC REMOVALS BY GRANULAR ACTIVATED CARBON PILOT CONTACTORS,

Philadelphia Suburban Water Co., Bryn Mawr, PA.
T. L. Yohe, I. H. Suffet, and P. R. Cairo.
Journal of the American Water Works Association, Vol 73, No 8, p 402-410, August, 1981. 16 Fig, 6 Tab, 27 Ref.

Descriptors: *Water treatment facilities, *Activated carbon, *Organic compounds, Chloroform, Philadelphia, Drinking water, Potable water, Water treatment.

The behavior of granular activated carbon during removal of specific organics from drinking water is discussed. Data are taken from a 15 week pilot study designed to ascertain the effects of aqueous chlorine on the GAC adsorption unit process. More than 100 specific organics were followed. For five specific compounds, the effects of mechanisms of surface oxidation and adsorption are detailed. These five compounds are chloroform, p-dichlorobenzene, 1,2-bis-(2-chloroethoxy)ethane, diacetone-L-sorbose, and dibutyl phthalate. The study showed that the concentrations of trace organics in Philadelphia drinking water fluctuate greatly. When applied to carbon filters these variable influents are reflected in the carbon beds and ultimately in the effluents. Pilot column effluent concentrations can exceed and have exceeded influent levels. Chloroform precursors exhibit adsorption behavior independent of the adsorption behavior exhibited by the surrogate total organic carbon parameter. Organics present in concentrations less than 1 microgram per liter are subject to displacement-desorption from GAC. Chlorine changes GAC properties chemically, physically,

and biologically. The greatest changes occur in uppermost bed regions, where chlorine increases surface oxides on the GAC. Alterations of upper bed properties appear to influence adsorption and subsequent desorption by creating broader initial adsorption bands. This results in broader readsorption bands within the column and causes initial breakthrough to be attenuated due to less severe displacement; this can slough a larger mass to the column effluent. (Baker-FRC)

HOW COMPUTERS HAVE CHANGED WATER WORKS OPERATIONS,

Water and Pollution Control, Vol 119, No 7, p 22, 31, 32, July, 1981.

Descriptors: *Water management, *Computers, Water supply, Toronto, Municipal water, Monitoring, Drinking water, Management, Decision making, *Water distribution, *Automation.

The amount of data required to efficiently operate a water works utility has made the use of computers for process control very appropriate. Practical installations in this area of distribution system operation began about 15 years ago. Central pumping control is a supervisory system operated over Bell Telephone signal circuits to monitor pumping stations and the distribution system and determine the status of valves, pumps and power supplies, reservoir levels, suction, discharge and district pressures and flows. It provides printouts of the data for the operator's information. New stations, when built, can be readily added to existing computer networks. The system as employed in Metropolitan Toronto is at present, due to age, showing signs of potential malfunction, and a new computer and updating of the supervisory system are planned. The process control computer serves to alert the operator immediately by means of an alarm display and with a hard copy alarm printout of any unusual occurrences in the plant's operation. The memory allows the creation of permanent records. Operators have communication with the computer through the operating console. Pushbuttons are presently dedicated to such items as level, flow,pressure, turbidity, chlorine residual and others of significance for water plant operations. The Metropolitan Toronto system has four filtration plants, currently undergoing computerization. (Baker-FRC)

COST OF SMALL WATER SUPPLY TREATMENT SYSTEMS,

Municipal Environmental Research Lab., Cincinnati, OH. Drinking Water Research Div.
R. M. Clark, and J. M. Morand.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1051-1065, October, 1981. 4 Fig, 12 Tab, 10 Ref.

Descriptors: *Cost analysis, *Water costs, *Water supply systems, *Water treatment, Water quality, Package plants, Reverse osmosis, Ion exchange, Maintenance costs, Operating costs, Technology, Chlorinated hydrocarbons, Trihalomethanes, Heavy metals, Metals, Turbidity, Water softening, Water treatment facilities.

Three water treatment alternatives for small systems are compared: conventional (flocculation, sedimentation, and filtration), direct filtration (without sedimentation), and package plants. Conventional treatment production costs were highest and package plants lowest up to 2 mgd. Direct filtration costs were lowest from 2 to 5 mgd. Costs of conventional treatment and package plants were equal at 9.5 mgd. 19 municipal and 17 recreational package plants were studied in Kentucky, West Virginia, and Tennessee. Coliforms were detected at 3 of 31 plants; 8 did not meet the 1 NTU turbidity standards; and 5 of 31 exceeded the 100 micrograms per liter total trihalomethanes standard. Pesticides were not detected in any samples. Heavy metals were detected in a few samples, in small concentrations except for a 19.6 microgram per liter Hg level in one sample. Other possible treatment methods for small systems (0.5 to 2.0 mgd) are (in decreasing order of cost): reverse osmosis, conventional treatment with softening, package plants with softening, and ion exchange with softening. At very small flows, reverse osmosis ranks third in cost, whereas at very high capacity, ion exchange becomes more expensive per unit. Still another possibility for reducing water costs in small communities is to form a regional compact. (Cassar-FRC)

WATER CLARIFICATION AND DECOLORIZATION WITH REGENERABLE MAGNETIC PARTICLES,

Commonwealth Scientific and Industrial Research Organization, South Melbourne (Australia). Div. of Chemical Technology.
D. E. Weiss, and W. G. C. Raper.
Effluent and Water Treatment Journal, Vol 21, No 8, p 359-363, 365, 366, August, 1981. 3 Fig, 6 Tab, 11 Ref.

Descriptors: *Clarification, *Water treatment, Clarifiers, Turbidity, Color removal, Iron compounds, Drinking water.

Magnetic materials have recently been incorporated into alum flocs, which may then be removed by means of a high gradient magnetic separator. Once it was understood that color and turbidity could be removed from water using performed particles, which were initially magnetic ion-exchange resins in a positively-charged form, a cheap magnetic particle was sought with the surface charge needed for removing impurities from water. A reversible positive charge was needed to allow regeneration and recycling. Ferric hydroxide coated onto very fine particles of magnetic ore was shown to perform well and was regenerable by treatment with hydroxide solution. However, it was not suitable for prolonged use. A very fine magnetite ore alone, after treatment with sodium hydroxide, was then used as an effective remover of color and turbidity. The surface charge is reversible under alkaline conditions to regenerate the particle for reuse. To achieve the charge reversal needed for regeneration, calcium must not be added in the alkaline stage. Hence, caustic soda rather than lime is employed as the regenerant. Laboratory and pilot plant tests using the principles outlined above are reported. The results of water quality tests at the highest rate tested to date, 25 Ml/d, indicate that turbidity has been lowered from 15 NTU to 0.6-1.0 NTU; color from 45 PT-Co to 3.5-5 PT-Co; total soluble iron from 3 mg/l to 0.04 mg/l; and hydrogen sulfide from 1 mg/l to a negligible amount. OPTIMIZING COAGULANTS AND FLOCCULANT AIDS FOR SETTLING,

Servico de Engenharia Emilio Baumgart Ltd., Belo Horizonte (Brazil).
J. R. Bratby.
Journal of the American Water Works Association, Vol 73, No 6, p 312-318, June, 1981. 10 Fig, 3 Tab, 10 Ref.

Descriptors: *Alum, *Coagulation, *Flocculation, *Water treatment, Nalco 8182, Turbidity, Settling velocity, Costs, Polyelectrolytes, Brazil, Pilot plants.

A method for choosing an optimum primary coagulant dosage, applied alone or with flocculant aids, is illustrated using raw water from Lago Descoberto, the water supply for the city of Brasilia. Preliminary studies showed that alum was the most desirable primary coagulant. A set of curves was developed to relate the overflow rate and coagulant dosage for the effluent qualities, 0.5, 0.6, 0.7, and 0.8 ftu, using raw water of average 3,24 ftu. Using the present worth method by Pilcher and considering costs of alum, costs of lime required to maintain optimum pH, and capital costs, the optimum dosage for alum alone was calculated at 15 mg per liter, with settling as the solid-liquid separation option. However, when flocculant aids are also used, the primary coagulant dosage is considerably lower. For determining optimum dosages in this case, the clogging of the filter surface, rather than costs, is the major consideration. Pilot plant experiments with 14 flocculants resulted in an optimum dosage of 3 mg per liter alum and 0.15 mg per liter polyelectrolyte (Nalco 8182) at pH 6.4. Total chemical costs using this treatment were estimated at 4.5 million Cruzeiros a year. (Cassar-FRC)

JONKOPING'S WATER SUPPLY,

Vattenbyggnadsbyran Ltd., Stockholm (Sweden). Water and Environment Engineering Dept.
S. Bergling.
Aqua, No 4, p 3-5, 1981. 5 Fig.

Descriptors: *Water treatment facilities, *Lakes, Drinking water, Reservoirs, *Lake Vattern, *Sweden, Jonkoping, Filtration, Chlorination, Ammonia, Water supply.

Jonkoping is situated on the southern end of Lake Vattern, Sweden's second largest lake, with a surface area of almost 2000 square kilometers, an average runoff of 35 cubic meters/second, and a total water volume of about 70,000 million cubic meters, corresponding to an average water period of about 60 years. This long detention period is one of the major factors in the high quality of water, with low plankton content and an average water transparency of 12 meters in the lake. Except for a combination of technical factors and the general conditions prevailing during the mid-nineteenth century, Jonkoping's water supply would have been based on this lake. In 1953 investigations regarding Jonkoping's future water supply proposed a new water treatment plant, to be sited on the west bank of the lake at Haggeberg, 1 km north of the Eklundshov plant, with sufficient capacity to meet the water demands of the entire town. Water was to be abstracted from the lake at such a depth that temperature variations would be minimal, and that treatment should consist of slow sand filtration, followed by alkalinization with lime water and chlorination accompanied by ammonia dosing. The plant became operational in 1957. The major parts of the plant include the lake water intake, lake water pipe, lake water pumping station, lake water pipe to slow sand filters, slow and filtration unit, low level reservoir sited in rock, drinking water pumping plant sited in rock, high and low voltage equipment, standby power plant, and main pipe to town. Slow sand filtration has proved an effective method of treatment, and an estimated filter speed of 0.30 meters/hr has been maintained. Long-term expansion of the Haggeberg plant is discussed. NEW EUROPEAN EXPERIENCES IN REMOVAL OF ORGANICS IN SURFACE WATER TREATMENT,

Water Supply, Zurich (Switzerland).
M. Schalekamp.
Aqua, No 4, p 0279-0289, 1981. 6 Fig, 12 Ref.

Descriptors: *Water treatment, *Quality control, Flocculation, Filtration, Adsorption, Lakes, Chlorination, Ozonation, Disinfection, Chlorine dioxide, *Switzerland.

Increased pollution of the environment has forced water treatment authorities in Switzerland to take further measures to protect and improve the quality of water being supplied to the citizens. Lakes in the area have passed from oligotrophic conditions to eutrophic ones. International cooperation has been good on improving matters concerned with the Rhine. Waterworks on the Lower Rhine have used practically all available possibilities for water treatment, including river bank filtration, ozonation, multi-layer filtration, GAC-filtration, neutralization and safety chlorination. In the future the following treatment processes will be employed on Swiss lake water plants: prechlorination, flocculation, double-layer rapid filtration with sand and pumice, neutralization, ozonation, GAC filtration, slow sand filtration and chlorine dioxide treatment. On practically every Swiss lake which is being used for drinking water production, the new treatment technique is already in operation or will shortly be in operation. The addition of chlorine dioxide does not act as an actual water treatment, but does serve as pipeline protection so that the water in the supply and distribution network remains hygienically perfect. The dosage is only 0.05 mg of chlorine dioxide per liter, so no difficulties arise with chlorite and chlorate. This entire cleaning process reduced organic substances by 90%, allowing a very high standard of water quality to be attained. Further work is now in order on wastewater cleanup. (Baker-FRC)

REDUCING PLUMBOSOLVENCY - THE EFFECT OF ADDED LIME ON THE LOCH KATRINE SUPPLY TO GLASGOW,

Strathclyde Regional Council (Scotland).
W. N. Richards, A. Britton, and A. Cochrane.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 4, p 315-333, July, 1980. 11 Fig, 4 Tab, 21 Ref.

Descriptors: *Solubility, *Lead, *Drinking water, *Glasgow, Scotland, Hydrogen ion concentration, *Water treatment, Lime, Alkalinity, Water supply, Corrosion, *Pipes.

Increasing the pH of Loch Katrine reservoir waters from 6.3 to 7.8 by the addition of lime has reduced the plumbosolvent nature of the water. The addition of lime has increased the number of random daytime samples complying with the international health standards for lead of 0.1 mg per liter from less than 50 to over 80 percent. Unsatisfactory samples continue to be obtained from premises with lead lined storage tanks, properties with copper to lead runs of piping, properties built before 1919, and properties with a single occupant. Lead solubility calculations indicate that further reductions in plumbosolvency should be possible if high pH values can be maintained at consumers' taps. (Titus-FRC)

PH CORRECTION: TECHNICAL ASPECTS OF A 500 TCMD TREATMENT WORKS,

Quest Automatron Research, Ltd., Dorset (England).
P. L. G. Pharaoh.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 4, p 334-345, July, 1980.

Descriptors: *Hydrogen ion concentration, *Water sampling, *Water treatment, *Water supply, Chemical analysis, Lead, Contamination, Technology, Solvents, Economic effects, Engineering, Storage, *Lime, Flow discharge, Chlorination, Electronic equipment, Design criteria, Design standards.

Electronic control was capable of maintaining the desired pH level by liming during major fluctuations of the slurry solution strength in a water treatment plant in Glasgow. Control and instrumentation in general proved to operate well within the initial specifications. Step functions induced in the control system either by manual means or by sudden high flow rates can be countered by the three term controllers and the swift response of the stroke and speed control equipment to the pumps. This system has enhanced plant operation and maintenance as well as reducing the incidence of blocked pipes normally experienced in other works in the region. (Titus-FRC)

THE INTEGRITY OF EXISTING DISTRIBUTION SYSTEMS,

Severn-Trent Water Authority (England).
D. W. Lackington, and J. M. Large.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 1, p 15-32, January, 1980. 12 Fig, 8 Ref.

Descriptors: *Distribution, *Water supply, *Drinking water, *Statistical models, *Pipelines, Sewers, Cost analysis, Corrosion, Deterioration, Monitoring, Maintenance, Boreholes, Chemical properties, Water treatment, Engineering, Technology, Climate data, *United Kingdom.

The integrity of the Leicestershire water distribution network is evaluated. A variety of parameters affecting the Leicestershire network were monitored. Investigations so far indicate that problems of burst frequency, discolored water, low residual pressure, and, to some extent, waste water are linked. The common factor is corrosion of unlined iron mains. This situation appears to be aggravated when new waters are introduced into old mains. Chemical treatment adding sodium silicate at the source is not considered a suitable alternative to physical repair of the network. (Titus-FRC)

METHODS FOR TREATMENT OF COLOR IN GROUNDWATER,

Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
G. F. Mitchell, and D. O. Hill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157850, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Institute, Mississippi State University. Report, September, 1981. 87 p, 43 Fig, 25 Tab, 61 Ref. OWRT-A-132-MISS(2), 14-34-0001-1126.

Descriptors: Ion exchange, Membrane processes, Oxidation, Coagulation, UV-radiation, Adsorption, *Color removal, *Groundwater, *Water treatment, Strong base ion exchangers, Weak base anion exchangers, Ultrafiltration, UV-radiation.

Ion exchange, ultrafiltration, coagulation, oxidation and other techniques were investigated for treatment of a groundwater containing organic color in the range of 20 to 60 units as platinum cobalt. Treatment with coagulation was often incomplete and required high dosages of coagulates. Oxidation was generally ineffective except with uv-radiation and hydrogen peroxide. Ultrafiltration was effective with a UM type membrane of 10,000 molecular weight cutoff providing over 90 percent color removal. A commercially available PM type membrane did not provide this removal except with pH adjustment of the feed to 5. Color removal was affected by membrane characteristics. Ion exchange on a macroporous strong base anion exchanger provided excellent color removal; however, upon regeneration and subsequent cycles of use the capacity of the exchanger was reduced by 70 to 80%. Additional study indicated that the regenerate could be reused and that a flow rate of 3 gpm/cu ft provided similar color removal to that achieved at 1 gpm/cu ft.

ENERGY COSTS AND PORTLAND WATER SUPPLY SYSTEM,

Bureau of Water Works, Portland, OR.
W. M. Elliot, and R. P. Hawley.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 365-374, October, 1981. 7 Fig, 2 Ref.

Descriptors: *Water management, *Energy, *Costs, *Water distribution, Pumps, Hydroelectric plants, Conduits, Electric power, Gravity flow, Water mains, *Portland, *Oregon, Operating policies, Water policy, Municipal water.

Rising energy costs, over 600% in the last 10 years, have led the city of Portland, Oregon, to adopt new policies for managing its water supply system. Major energy savings are provided by: (1) installing a 50 million gal buried reservoir on Powell Butte, including conduits for interconnecting the entire water system, (2) constructing a gravity conduit to supply eastern Washington County, (3) retrofitting two existing dams to produce a total of 36 megawatts, (4) pump replacement and modification, and (5) improving pump operation. It is expected that energy costs will be reduced by 50% when all phases of the project have been completed. (Cassar-FRC)

TRIHALOMETHANE PRECURSOR CONTROL BY ADSORPTION,

Tennessee Univ., Knoxville. Dept. of Civil Engineering.
G. D. Reed, and A. F. Zey.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1095-1099, October, 1981. 5 Fig, 10 Ref.

Descriptors: *Adsorption, *Activated carbon, *Chlorinated hydrocarbons, *Water treatment, Ion exchange resins, Anion exchange, Organic compounds, Trihalomethanes, Organic matter.

Activated carbon (granular bituminous based Nuchar WVG) was effective in removing trihalomethanes and their precursors from prechlorinated, treated Missouri River water in pilot plant studies over the period September 1 to October 25. A weak base anion exchange resin (Diamond Shamrock ES-561), designed to adsorb high molecular weight organics, removed only small amounts of precursors, and the effluent concentration rose significantly with increasing run time. A carbonaceous resin (Ambersorb XE-340), designed to adsorb low molecular weight organics, had no capacity for removing trihalomethane precursors; effluent concentrations were often higher than influent concentrations. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 474-506. 10 Fig, 7 Tab, 37 Ref.

Descriptors: *Estuaries, *River flow, *Saline water intrusion, *Environmental effects, *Environmental protection, *Diversion losses, Pollution load, Fisheries, Dams, Canals, Water demand, Aquatic life.

Estuaries around the world are experiencing reduced freshwater inflows because of human actions such as damming and consumptive withdrawals, and natural causes. The low flow results in increased salinity in the estuary and salt water intrusion into previously freshwater stretches of the river. Research has shown that if freshwater flows are decreased by 25-30%, severe environmental disturbances result. Studies of some Russian rivers show that up to 50% of their flow is being diverted, and similar figures are available for flows into the San Francisco Bay-Delta. The freshwater flow reductions are aggravated by increasing pollution loads which reduce sustaining biota and hence reduce fish and shellfish populations. Two projects are being developed in Russia to prevent salinity intrusions into the rivers of the Black Sea and Azov Sea. A fixed sea water check dam will completely prevent the entrance of sea water into the delta and change the delta into a freshwater lake. A dam with a built-in restraining canal will ensure a constant connection with the sea but limit the entrance of sea water to acceptable levels. The former is preferable from the point of freshwater supply and the latter assures a better preservation of natural conditions and unimpeded navigation. Such a system is proposed for the San Francisco Bay-Delta, in the Carquinez Strait between Suisun and San Pablo Bays. (Brambley-SRC)

HYPOLIMNETIC AERATION OF A SMALL EUTROPHIC KETTLE LAKE: PHYSICAL AND CHEMICAL CHANGES,

McGill Univ., Montreal (Quebec). Dept. of Biology.
C. T. Taggart, and D. J. McQueen.
Archiv fur Hydrobiologie, Vol 91, No 2, p 150-180, May, 1981. 15 Fig, 5 Tab, 51 Ref.

Descriptors: *Lake restoration, *Aeration, *Water quality management, Dissolved oxygen, Oxygen, Hypolimnion, Metalimnion, Stratification, Eutrophic lakes, Tory Lake, *Ontario, Nitrogen, Phosphorus, Hydrogen sulfide, Manganese.

A small hypolimnetic aerator effectively removed Mn, P, and H2S from a small hypereutrophic lake, Tory Lake, Ontario, but was ineffective for nitrogen and CO2 removal. Aeration studies were conducted on two successive summers. The average dissolved oxygen concentrations in the hypolimnion were raised by 2.42 mg per liter in 1978 and by 1.47 mg per liter in 1979 from values < 1 mg per liter. The aerator was not capable of raising hypolimnetic dissolved oxygen above 5 mg per liter during the summer. Hypolimnetic cycling time was 4.15 days in 1978 and 3.07 days in 1979. Air flow rates in 1979 were increased to compensate for the increased hypolimnion volume, which was 2.5 times that of 1978. Stratification was not disturbed by the treatment. The metalimnion had increased H2S and was virtually anoxic by July in both summers. This condition would be a barrier to zooplankton and fish movements. (Cassar-FRC)

SEWAGE OUTFALL LOCATION REDUCES ENVIRONMENTAL DAMAGE IN THE THAMES ESTUARY,

Metropolitan Pollution Control-Thames Water, London (England).
M. J. Andrews.
Water Science and Technology, Vol 13, No 7, p 265-270, 1981. 2 Fig, 2 Tab, 9 Ref.

Descriptors: *Estuaries, *Water pollution prevention, *Outfall sewers, Water quality control, Water quality management, Salinity, Wastewater outfall, Environmental effects, Ecological effects, Aquatic life, *Thames estuary, England.

The placement of major sewage outfalls in estuaries may be an important factor in minimizing environmental pollution. The least damage will occur where there are fewer species at risk. In estuaries, the junctions of mesohaline and oligohaline waters contain the smallest numbers of species. This area is unattractive to fishermen and is rarely used for swimming, since the average salinity is about five parts per thousand. In the Thames estuary, the minimal environmental damage would probably occur in areas where shellfish beds would not be destroyed, fish spawning affected, or bathing beaches made unfit for public recreation. The siting of London's major sewage outfalls at the five parts per thousands area of salinity has helped in accelerating the rehabilitation of the once polluted estuary by plants and animals. The principal disadvantage of locating outfalls at the five parts per thousand area is that both freshwater and marine components of the fauna are at risk. (Geiger-FRC)

AN ESTIMATION OF THE REAERATION COEFFICIENT IN NATURAL STREAMS BY SPECTRAL ANALYSIS OF TIME SERIES DATA,

Tokyo Univ. (Japan). Dept. of Urban and Sanitary Engineering.
T. Matsuo, and N. Yotsukura.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $6.75, Microfiche $3.50. Geological Survey Open-File Report 81-648, 1981. 47 p, 18 Fig, 4 Tab, 21 Ref.

Descriptors: *Model studies, Estimating, *Natural streams, *Spectral analysis, *Time series analysis, Mathematical models, Aeration, Dissolved oxygen, Biochemical oxygen demand, Light intensity, Water temperature, Streamflow, Flow characteristics, Reaeration coefficient, Mass transfer, *Water quality control.

Spectral analysis of time series data for the dissolved oxygen concentration (DO), water temperature, and sunlight intensity is used to estimate the reaeration coefficient of a natural stream. The streamflow is assumed to be steady and uniform hydraulically and homogeneous biologically. Under such conditions, the temporal variation of DO may be caused solely by that of the sunlight intensity. The DO mass balance equation becomes a first-order linear differential equation, which can be solved by means of the Fourier series. The reaeration coefficient is then expressed as a function of the phase shift between the sunlight intensity and DO, and between the sunlight intensity and saturation concentration of DO, and of the Fourier coefficients for the fluctuating portion of the DO and the saturation concentration of DO. Computing these parameters from data obtained at a single measurement station, the reaeration coefficient of the Cuyahoga River, Ohio, was estimated to range from 2.6 to 7.7 per day during selected periods in 1976 and 1977. COMPARISON OF METALS AS CATALYSTS FOR THE PHOTOLYSIS OF WATER,

Auburn Univ., AL. Dept. of Chemistry.
T. R. Webb.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157801, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, November 30, 1980. 8 p, 11 Ref. OWRT-A-080-ALA(1), 14-34-0001-1101.

Descriptors: *Hydrogenation, *Photolysis, *Catalysts, *Metals, Rhodium, Platinum, Comparison studies, Chemical reactions, Water quality control.

A study of the platinum-catalyzed photolysis of water to produce hydrogen is described. Experiments indicated that rhodium could be substituted for platinum as catalyst, that palladium was feebly effective, and that ruthenium, gold, iridium, and silver were not effective. Studies of related ruthenium and iron complexes showed that ruthenium-phenanthroline and iron-phenanthroline complexes could work as light-absorbing species in place of a more-studied ruthenium-bipyridine complex; europium ion showed some promise as an electron-transfer reagent. Preliminary experiments suggest that hydrogenation of double bonds occurs in the system.

WATER LAW, WATER CONSERVATION AND THE DEVELOPMENT OF ENERGY RESOURCES IN THE COASTAL, OFFSHORE AND FLOOD PLAIN AREAS OF ALABAMA,

Alabama Univ., University. School of Law.
H. Cohen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157884, Price codes: A05 in paper copy, A01 in microfiche. Natural Resources Center, University of Alabama, Research Report, 1981. 93 p. OWRT-B-080-ALA(1), 14-34-0001-1201.

Descriptors: *Water law, Environment, *Oil and gas production, Pollution, *Coastal zone management, Wetlands, Flood plains, *Environmental control, *Water quality control, *Alabama.

This Report is about mineral development and water conservation in the coastal areas. It is not a discussion of the general problems of land and water uses in the coastal zones. It does not deal with the problems of residential housing along the beach fronts or dredging and filling for subdivision or condominium development. The coastal environment has always been thought to be hardy one, able to withstand a great deal of burdensome human activity, but it has recently been realized than man's various coastal projects bring significant environmental or ecological problems. The wetlands and the estuarine areas, including so called swamplands once considered wastelands, are now known to be vital to the balance of nature and essential to the plant and fish life as well as water quality in the area. The coastlines and wetlands are also flood plains. When great storms rage, as they inevitably do, the tides overcome the coastal areas. The Congress and numerous states have reacted to these dilemmas. Flood plain controls were created to prohibit construction which may damage property and endanger lives downstream. Wetland and coastal management legislation has been aimed at trying to preserve delicate ecological systems which affect the future of wildlife and the entire chain of natural phenomenon in the area. Out short term interests demand that we intensify our exploration for, and our production of oil and gas. Long term interests demand that we keep intrusion into our coastal areas and possible resultant pollution at a minimum. Out challenge is to conduct our mineral development in such a manner as to keep the environment as clean as possible.

THE PHYSICO-CHEMICAL AND PLANKTONIC RESPONSE OF AN ALGICIDE-TREATED SHALLOW MOUNTAIN LAKE IN ARIZONA,
Northern Arizona Univ., Flagstaff. Dept. of Biological Sciences.
S. S. Schwartz, D. W. Bliss, and G. Johnson.
Internationale Revue der Gesamten Hydrobiologie, Vol 66, No 2, p 249-262, 1981. 2 Fig, 1 Tab, 37 Ref.

Descriptors: *Algicides, *Plankton, Lakes, *Arizona, Mountain lakes, Eutrophication, *Water quality control, Physicochemical properties, Algae, *Ashurst Lake, Ecosystems, Ecological effects.

The response and recovery of a mountain lake ecosystem was followed after treatment with an algicide. The physico-chemical parameters and phytoplankton and zooplankton populations were monitored during the course of the study in Ashurst Lake. Frequent winds, shallow depth and the exposed nature of the basin insure that the lake's water column remains nearly homogeneous throughout the year. The lake was treated with Aquazine (simazine) on 9 July 1975 at an active concentration of 0.45 mg/liter to analyze its effectiveness for controlling nuisance blue-green algal blooms. Sampling was initiated on 25 May 1975 and continued at biweekly intervals until 9 November, with the remainder of the sampling done at monthly intervals for a total of 2.5 years. Within 3 days of treatment a minor bloom of Anabaena circinalis was reduced by 30%, and after 14 days to negligible cell numbers. This species failed to be a major component of the phytoplankton for the next 2.5 years. The usual late summer bloom species, A. flos-aquae, appeared at reduced densities about 1 month after treatment. In the summer of 1976, A. flos-aquae appeared during about the same period as recorded for years prior to treatment. Algicide concentrations of more than 3.0 mg/liter were adequate to control blue-green bloom species. The following September the lake was treated with rotenone to remove trash fish. Surface blooms of A. flos-aquae disappeared within 12 hr of treatment. Cryptophyta appeared to benefit during this time. (Baker-FRC)

LIMING ACID PONDS IN NEW YORK,
New York State Dept. of Environment Conservation, Watertown.
L. M. Blake.
New York Fish and Game Journal, Vol 28, No 2, p 208-214, 1981. 1 Fig, 2 Tab, 8 Ref.

Descriptors: *Lime, *Acidic water, Water, Acid rain, Fishing, *New York, *Lakes, Ponds, Water quality, Hydrogen ion concentration, *Fish populations.

This paper reviews various treatments, considering changes in pH, alkalinity and fish populations as a result of liming ponds to neutralize acid conditions. Cost-benefit ratios are considered. Application of hydrated lime in New York State is limited to open-water periods for economic reasons. Hydrated lime is superior to the less potent agricultural lime, calcium carbonate, although the latter permits a longer time between treatments. No matter which type of lime is used, the lime is dumped from bags from a slowly moving boat. More lime is spread in shallow water areas than over deep water areas so that the lime is placed where the fish live and it is exposed more effectively to wave action and currents. The use of lime in remote areas is more difficult due to the high cost of transport. Possible increases in mercury content of fish after lime treatment were studied. Mercury levels were determined in brook trout from selected lakes, limed and unlimed. No increase in mercury levels was apparent in either limed or unlimed control waters. Costs for liming remote ponds range as high as $297 per acre. Experience with the dry dispersal method has shown that lime can be moved at a rate of 5 tons per hour. The average cost of this method should be about $100 per acre. It was concluded that for both accessible and remote ponds, liming is an effective and economically feasible tool which can be used to counteract the adverse impact of acid precipitation and maintain selected fisheries. AUTOMATED STREAM DIVERSION FOR RESERVOIR PROTECTION,
Fraser (J. Kenneth) and Associates, Rensselaer, NY.
J. A. Besha, V. C. McGuffey, M. R. Rafferty, and M. P. Brown.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1085-1089, October, 1981. 1 Fig, 1 Tab, 2 Ref.

Descriptors: *Diversion structures, *Automation, *Storm water, Water quality control, Diversion, Reservoirs, Streams, Highway effects, Construction, Soil erosion, Erosion, Monitoring, Control systems, Turbidity, *Reservoir protection.

Control of water quality during highway construction in the Richmondville, New York, watershed was accomplished with an automated monitoring and stream diversion system. Turbidity, pH, and conductivity of the two influent streams are continuously monitored by electric probes. When these parameters exceed 20 NTU, pH 8.5, or 350 micromho 15 times during a 10 min period, the stream diversion sequence is activated. A programmable controller initiates opening of valves which release nitrogen gas into inflatable bladder dams at the points where streams enter the reservoir. Thus the flood is rerouted to the streams below the reservoir. The controller also controls sampling pumps, backwashing of sensing lines, data input and output, and a telephone communication system. Programmability allows fine adjustments for such perturbations as animals walking in the stream. In the first two years of operation 52 water diversion sequences were initiated by high turbidity, and four each by pH and conductivity excesses. Installation costs were $125,000, and annual operating costs, $20,000. (Casser-FRC)

COLORADO RIVER SIMULATION SYSTEM; AN EXECUTIVE SUMMARY,
Bureau of Reclamation, Denver, CO. Engineering and Research Center.
M. S. Cowan, R. W. Cheney, and J. C. Addiego.
October, 1981. 16 p, 5 Fig, 1 Tab.

Descriptors: *Computer models, *Simulation, *Water management, *Colorado River, Water resources development, Water supply, Water demand, Hydrology, River flow, Water quality.

The CRSS (Colorado River Simulation System) is a deterministic digital computerized simulation model that has been developed by the Bureau of Reclamation in accordance with all the 'Laws of the River'. With CRSS, proposed changes to the operation or alternative development schemes of the river system can be modeled and their effect on the future quantity and quality of water in the river may be evaluated. The CRSS comprises seven programs and data bases: CRSM (Colorado River Simulation Model); operational control data; demand data base; demand input generation program (SMDID); natural flow and salt data base; hydrology input data generation program (MHYDRO); and output summary program (TAPEDIT). The basin as presently modeled consists of 24 reaches, each of which represents a specific geographic area, and within which up to 10 inflows and 10 different demands can be identified. The model simulates river basin flows on a monthly time frame, starting at the top of the basin and proceeding to the bottom. River flows are calculated at each inflow, demand, and reservoir sequence point. With the demand data base as input, SMDID generates the demand data for CRSM, and summaries of projected depletion by water use, state, and basin. The hydrology data input to CRSM is generated by running the program MHYDRO with the hydrology data base and control data as input. (Brambley-SRC)

SOLID SET IRRIGATION SYSTEM DESIGN USING LINEAR PROGRAMMING,
Ben-Gurion Univ. of the Negev, Sde-Boker (Israel). Inst. for Desert Research.
G. Oron, and D. Karmeli.
Water Resources Bulletin, Vol 17, No 4, p 565-570, August, 1981. 1 Fig, 2 Tab, 11 Ref.

Descriptors: *Linear programming, *Sprinkler irrigation, *Design criteria, Systems analysis, Costs, Pipes, Optimization, *Irrigation design, Case studies.

The formulation of a solid set irrigation system (sprinkler or trickle) using linear programming is presented. The formulation is based on an objective function for the minimum system cost and the various hydraulic and operational constraints. Given the characteristics of the water resource, the linear programming analysis will minimize the cost of a solid set system and obtain optimum pipe diameters and related sections lengths. The objective function consists of equipment, energy and labor components. The pipe network is optimized with the aim of determining optimal diameters for various pipe sections. A capital recovery factor assumes similar interest rates and longevity of all components. A case study is presented which develops a solid set under tree sprinkler system for an orchard (176 m x 144 m). (Small-FRC)

WEEKLY MULTIPURPOSE PLANNING MODEL FOR TVA RESERVOIR SYSTEM,
Tennessee Valley Authority, Norris.
J. E. Giles, and W. O. Wunderlich.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 495-511, October, 1981. 8 Fig, 7 Ref.

Descriptors: *Computer models, *Reservoir operation, *Dynamic programming, Mode studies, Decision making, Future planning, Planning, Economic aspects, Evaluation, Systems analyses, Fortran, Tennessee Valley Authority.

A weekly planning model for planning and operational studies of the Tennessee Valley Authority (TVA) reservoir system is described. The model simulates the operation of a multipurpose, multireservoir system by weekly time procedures up to one year and evaluates an objective function comprised of five cost functions. The model, which uses dynamic programming by successive approximations, was applied to various planning problems with influential system-wide impacts. Results showed the model to be a powerful computerized planning tool with an updatable system as applica-

tion experience increases. The effect of foresight has been evaluated in applications of the model to several case studies. Foresight may be limited by reducing the planning period, using constraints within the planning period, using overlapping planning periods and discounting future costs. The capabilities and limitations of the model have not yet been fully explored. Although the rigid constraint approach was found to be the most expedient technique for the decision makers of the TVA organization, the model is not limited to this approach and may be used when policies are based on direct measures. POSSIBILITY OF INVESTIGATING OPEN-CHANNEL FLOWS ON AN ANALOG COMPUTER,

K. N. Koida.
Hydrotechnical Construction, No 3, p 268-269, March, 1980. 3 Fig, 1 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 34-35, March, 1980.

Descriptors: Open channels, *Computers, *Analog computers, Flow measurement, *Flow characteristics, Flow discharge, Flood discharge, Stream discharge, *Model studies, *Open-channel flow.

The differential equation of a uniform gradually varied flow with a constant discharge in an open cyclindrical channel is considered. This equation is usually solved numerically on a digital computer in plotting the curves of the free surface. Analog computers have not generally been used for this type of problem. However, through some manipulations, this matter can be handled on the analog computer as well, which deals quite adequately with a system of nonlinear equations. Use of the analog computer permits the investigator to change the initial depth and bottom slope during modeling, to determine the critical and normal depths and critical slope, and to investigate any type of curves of the free surface. Investigations of flows in open channels on an analog computer are distinguished by clarity. A cathode-ray tube display is used to observe the solution. The accuracy of the solution depends on the type of computer used. With modeling on the MN-7M it was possible to find the normal depth, determined preliminarily on a digital computer with a high accuracy, with an error of 7%. Flows in channels with a variable slope of the bottom can also be investigated on the analog computer. (Baker-FRC)

EMPHASIS ON DISTRIBUTION: STRATEGIES FOR SMALL SCALE WATER RESOURCES DEVELOPMENT IN THAILAND,

Asian Inst. of Tech., Bangkok (Thailand). Div. of Water Resources Engineering.
A. Arbhabhirama, S. Angel, and M. R. Brewster.
Water Resources Bulletin, Vol 17, No 3, p 483-493, June, 1981. 2 Fig, 4 Tab, 15 Ref.

Descriptors: *Water distribution, *Water resources development, *Water policy, *Thailand, Reservoirs, Irrigation systems, Planning, Short-term planning, Canals, Rivers, Water supply development, Economic aspects, Developing countries, Subsidies.

Water resources development for northeast Thailand, the poorest region in the country, should shift its emphasis from construction of large storage reservoirs which benefit a few farms to construction of water distribution systems which reach a large number of farms. The water policy for this area should entail: effective distribution of water from existing large reservoirs and reliable rivers to people adjacent to these sources, and development of small water resource projects (small reservoirs, weirs, ponds, and wells) to meet the needs of farms out of reach of the large reservoirs and rivers. Three zones were defined, based on access to water supply sources. A 5-year plan (1980-85) for implementing these strategies has been formulated. There are six key recommendations: (1) move rapidly to adopt a water resources development strategy for this area by establishing the appropriate agencies, (2) support and improve existing distribution systems, (3) increase provincial involvement in the small water projects, (4) initiate a provincial water survey to identify the best water projects for each village, (5) allocate subsidies for village water projects based on a fixed subsidy per family, average $250 per family or $500 million total, and (6) encourage villagers to own and operate their own water projects. THE USE OF MATHEMATICAL MODELLING AS A DECISION-MAKING TOOL IN THE WATER AUTHORITIES OF ENGLAND AND WALES FOR WATER-QUALITY MANAGEMENT,

Newcastle upon Tyne Univ. (England).
K. D. Russell, and M. B. Pescod.
Water Pollution Control, Vol 80, No 3, p 390-397, 1981. 4 Tab, 9 Ref.

Descriptors: *Water quality management, *Mathematical models, Model studies, Planning, Decision making, Administrative decisions, *Great Britain.

This paper reviews experience gained in England using mathematical modelling techniques as decision making tools in water quality management. Information was collected through questionnaires sent to all water authorities of England and Wales in December 1978. It appeared that 27 models are available for use in the ten water authorities. Most authorities have two models. Roughly half of the available models are for the freshwater regime, and the other half are for tidal applications. The most popular model language in use was Fortran. Due to the high cost of model production, many authorities have adopted the Water Research Center inland water quality model for use in freshwater regimes. Running costs and CPU times were variable, depending on computer installation, computer operating system, complexity of the system modelled and optimality of the solution. The most common application for modelling was in setting consent conditions for discharges. Other important uses included dealing with alterations in flows due to regulation or abstraction. Five models were used in planning new treatment works. Two models have direct economic connotations. In general it appeared that insufficient data are used, which will necessarily result in unrealistic predictions when the models are applied where conditions are outside those of the calibration range. It was felt that techniques used to generate water quality data need to be evolved to assist in overcoming the resource restrictions of real data collection. Synthetic flow generation has been used for some time in the field of hydrology, and this approach would be of use if applied to water quality. (Baker-FRC)

SYSTEMS ANALYSIS APPLIED TO WATER MANAGEMENT IN DEVELOPING COUNTRIES: PROBLEMS AND PROSPECTS,

Biswas and Associates, Oxford (England).
A. K. Biswas.
Environmental Conservation, Vol 8, No 2, p 107-112, Summer, 1981. 7 Ref.

Descriptors: *Developing countries, *Systems analysis, *Water management, Regional development, Computers, Model studies.

Third world countries have not generally made use of systems analysis and the application of computer technology for planning water resources development and management processes. Because water management is so complex, it is important to utilize any available tool such as systems analysis to analyze all possible strategies and viable alternatives. Models do not fail because of lack of technical expertise or inadequate computer technology. Failure is usually the result of managerial problems. Models can be used in developing countries, although some models of this type are rather crude and are dependent upon the judgment and expertise of the analyst. (Small-FRC)

WATERLOGGING CONTROL FOR IMPROVED WATER AND LAND USE EFFICIENCIES: A SYSTEMATIC ANALYSIS,

Colorado State Univ., Fort Collins. Water Resources Research Inst.
A. Simpson, H. J. Morel-Seytoux, R. A. Young, G. E. Radosevich, and W. T. Franklin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157983, Price codes: A08 in paper copy, A01 in microfiche. Completion Report No 108, December, 1980. 138 p, 41 Fig, 3 Tab, 46 Ref, Append. OWRT-C-7144(6211)(2), 14-34-0001-6211.

Descriptors: Pump drainage, Reclamation of waterlogged lands, Surface-groundwater simulation, Drainage of waterlogged lands, *Waterlogging, *Salinity, *Irrigation practices, *Groundwater management, *Land management, Drainage, Surface-groundwater relations, Model studies, *San Luis Valley, *Colorado, Rio Grande River.

The problems of waterlogging and salinization are often associated with irrigated agriculture. Both these problems exist in the San Luis Valley, in southern Colorado. This study considers a 500 square mile study area south of the Rio Grande River in the San Luis Valley. Many thousands of acres of the study area are subject to waterlogging each year. A Fortran IV computer simulation model of the stream-aquifer-irrigation system in the study areas was developed. The computer simulation model is used to investigate two alternative management strategies and to compare effects with past water management programs (the 'historic strategy'). These strategies aim to lower the water table in the waterlogged area to enable the growing of crops using center-pivot sprinkler irrigation. The report is divided into two main parts. The first part describes the study area and the components and interactions considered in the development of the hydrologic computer model, including a detailed description of the actual computer program. The second part of the report concerns an analysis of the management strategies aimed at reducing the waterlogging problem. The historic strategy and two alternative management strategies were subject to analysis. The first alternative management strategy involves a 16 square mile well field called the La Jara Creek well field development. The second alternative strategy is the 10 square mile Rock Creek well field development. A comparison of the effects of the historic management strategy and the two alternative well field development strategies is provided.

ANALYSIS OF FIRM WATER SUPPLY UNDER COMPLEX INSTITUTIONAL CONSTRAINTS,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. M. Shafer, J. W. Labadie, and E. B. Jones.
Water Resources Bulletin, Vol 17, No 3, p 373-380, June, 1981. 5 Fig, 2 Tab, 8 Ref. OWRT-B-201-COLO(3).

Descriptors: *Water rights, *Reservoir operation, *Institutional constraints, Water allocation, Water policy, Water supply, Water management, Water users, Water use efficiency, Water reuse, Cooling ponds, Legal aspects, Rawhide project, *Colorado, Powerplants, *Model studies, River basins, Diversion.

Legal and institutional factors (such as formal and informal water rights) governing water allocation were included in a river basin simulation study of the Cache la Poudre River basin, Colorado, site of the planned Rawhide coal fired steam electric generation facility. Objectives for this study were to determine if the cooling pond at the plant could be filled prior to the beginning of power generation in 1985 and if a minimum 4200 acre-feet of reusable water could be provided at a uniform rate after filling. The MODSIM model was calibrated by adjusting physical parameters until they reasonably fit historical operational priorities. These priorities included water quality, flood control, recreation, and hydropower. Alternatives for reservoir operation and diversions were evaluated, dividing the water system into links and nodes representing reservoirs, ponds, municipal use, wastewater treat-

ment plants, rivers, canals, and effluents. This determined the optimum scheme for filling and maintaining the cooling pond without causing harm to present water users in the basin. A prior agreement had decreed an 8038 acre feet per year reservoir release; the model reached a figure of 8122 acre feet. (Caesar-FRC)

DELINEATION OF ACID MINE DRAINAGE POTENTIAL OF COAL-BEARING STRATA OF THE POTTSVILLE AND ALLEGHENY GROUPS IN WESTERN PENNSYLVANIA,

The Pennsylvania State Univ., University Park. Dept. of Geosciences.
R. J. Hornberger, R. R. Parizek, and E. G. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157876, Price codes: A17 in paper copy, A01 in microfiche. Institute for Research on Land and Water Resources, The Pennsylvania State University, Research Project Technical Completion Report, November, 1981. 359 p, 159 Fig, 18 Tab, 197 Ref. OWRT-B-097-PA(1), 14-34-0001-7182.

Descriptors: *Acid mine drainage, Mine drainage, Stratigraphy, Hydrogeology, *Path of pollutants, Forecasting, *Model studies, *Coal mining, *Pennsylvania, *Paleoenvironment, Water quality, Groundwater quality.

The goal of the research was to test the relationship between paleoenvironment and acid mine drainage production on a regional basis. Coal mining data from 23 counties, or approximately 225 quadrangles, were obtained from mine drainage permit records, and a computer program was written to map these data. More than 150,000 lines of water-quality data were retrieved from the STORET data base, from which contour maps and trend surface maps were constructed. A computer program was developed to compare the water-quality and coal mining data using a grid cell structure. Five subregions of differing geologic setting were delineated within the study area, and variations in acid production of specific stratigraphic intervals across the subregions were examined using deep-mine drainage data, ground-water data and data obtained from leaching experiments, sulfur analyses, and microscopy of coal samples. There appeared to be significant relationship between the presence of calcareous strata and the lack of acid mine drainage from associated underlying coals. However in non-calcareous facies, no significant relationship between variations in paleoenvironment and variations in acid production could be determined from regional water quality patterns, or deep mine drainage data, or laboratory leaching tests.

DEVELOPMENT OF A PROTOTYPE METHOD FOR TRAINING USERS OF WATER RESOURCES PLANNING MODELS: PHASE I,

Montana State Univ., Bozeman. Dept. of Industrial and Management Engineering.
D. W. Boyd, and T. G. Plaggemeyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157934, Price codes: A05 in paper copy, A01 in microfiche. Montana Water Resources Research Center, Montana State University, Report No 118, September, 1981. 102 p, 4 Ref, 2 Append. OWRT-A-124-MONT(1), 14-34-0001-0128.

Descriptors: *Computer models, *Education, River basin development, *Management planning, Interactive computing, *Montana Water Planning Model, Self-instruction method.

The once operational Montana water planning model has been lost to the Montana Department of Natural Resources and Conservation due to personnel turnover. Upon implementation in 1973, the model demonstrated its utility as a planning tool during the 1973-1976 moratorium on the Yellowstone River Basin. The cost in time and effort for new personnel to learn how to use the model by reading the original technical reports is prohibitive. Alternatively, learning could be accomplished at a much lesser cost if a computerized training method were available. Accordingly, a prototype method for training users of water resources planning models was developed. The program (called PLANNER) is accessed from a terminal connected to a mainframe computer. The program operates in the interactive mode and features a step-by-step development of a macro model of the Yellowstone River Basin. A companion user's manual is provided. From experience with the prototype to date, it is recommended that water planning agencies adopt a computerized training program for its water planning personnel. In addition, the program should be installed on a minicomputer dedicated to water planning rather than on a mainframe computer system which is subject to constant change. (Hunt-Mont)

OPTIMAL STREAM-AQUIFER DEVELOPMENT,

Illinois Univ. at Urbana-Champaign. Dept. of General Engineering.
O. Coskunoglu, and C. M. Shetty.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 513-531, October, 1981. 4 Fig, 2 Tab, 40 Ref.

Descriptors: *Computer models, *Water management, *Water resources development, *Design criteria, Model studies, Aquifer management, Groundwater management, Water supply development, Groundwater recharge, Water use, Mathematical models.

A large, nonlinear, nonconvex mathematical model was formulated to optimize the conjunctive use of surface and groundwater resources for irrigation, hydropower generation, aquifer recharge and other mandatory requirements. The designing of solution procedures offered a more realistic approach to engineering problems. The solution procedure, programmed in FORTRAN, was tested with realistic data to obtain an optimal solution for a problem with 394 variables and 390 constraints. The total execution time required to compute the optimal design and operation would cost about $200. With experienced practitioners, better starting points for computation may be achieved, making the convergence to the optimal solution more rapid. Calculations of optimal operations revealed that in wet periods, the surface water usage rate increases, while the groundwater usage rate decreases. The opposite occurs in dry periods. The reservoir detention requirements would decrease as a result of this synergism, while the overall net benefits increase. The refinement achieved in solving dynamic programming problems is also discussed. (Geiger-FRC)
W82-02575

OPERATION POLICY ANALYSIS: SAM RAYBURN RESERVOIR,

Hydrologic Engineering Center, Davis, CA.
D. T. Ford, R. Garland, and C. Sullivan.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 339-350, October, 1981. 4 Fig, 4 Tab, 16 Ref.

Descriptors: *Operating policies, *Reservoir operation, Systems analysis, Model studies, Simulation analysis, *Sam Rayburn Reservoir, *Texas, Saline water intrusion, Multipurpose reservoirs, Optimization, Water allocation, Water storage, Water use, Reservoir storage.

A combined optimization-simulation method was developed and used to solve management problems at the two-reservoir Sam Rayburn system, Texas. The major concerns at this installation are salt water intrusion, hydropower production, recreational use, and flood control. The simulation model is a single reservoir model that accounts for water use throughout the system, satisfying demands and allocating water according to specific priorities. The simulation model is linked with a nonlinear programming algorithm that selects the optimal operating policy. The resulting operating policy is smoothed using the engineering judgment of persons involved in daily operation of the system, and system response with this smoothed policy is simulated. Reiteration of this step is performed to obtain the final operating policy. (Caesar-FRC)
W82-02589

COMPARISON OF DETENTION BASIN PLANNING AND DESIGN MODELS,

Maryland Univ., College Park. Dept. of Civil Engineering.
J. R. Donahue, R. H. McCuen, and T. R. Bondelid.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 385-400, October, 1981. 3 Fig, 6 Tab, 12 Ref.

Descriptors: *Storm water, *Urban drainage, *Detention reservoirs, Model studies, Design criteria, Planning, Runoff, Rainfall-runoff relationships, Drainage, Storage capacity, Water management, Flood control, Comparison studies, Land use.

Significant differences in storage volume were obtained using seven different methods of designing storm water detention basins. It is suggested that planners select a method most representative of the local hydrology. Comparisons of two design methods and five planning methods on watersheds of 50, 200, and 500 acres; for residential, commercial, and industrial land uses; and for 10 and 100 year return periods indicated that two of the models were most suitable. The Bondelid method, a computerized optimization method, was recommended for design purposes. The Soil Conservation Service TR-55 method, using input similar to the Bondelid method, was recommended for planning purposes. Other methods considered were: Baker, Illinois Urban Drainage Area Simulator (ILLUDAS), Abt and Grigg, Wycoff and Singh, and Loss of Natural Storage. (Caesar-FRC)

FWS/OBS-81/04, Vol II, Oct. 1981, p 197-215. 9 Fig, 15 Ref.

Descriptors: *Sediments, *Sedimentation, *Estuaries, *Navigation, *Flow separation, Estuarine environment, Aquatic habitats, Wetlands, Cost-benefit analysis, Dredging, Wildlife, Fish, Colorado River, Atchafalaya River, Comparison studies.

Sediment introduction is a corollary of river-associated freshwater inflow in many estuaries. These sediments represent an asset relative to delta building and associated estuarine wetlands, a liability in maintaining navigation access. A multipurpose approach to resolving this conflict is the separation of navigation from sediment-laden freshwater inflow. Such a separation, as authorized for the Colorado River, provides dual benefits: reduced maintenance dredging and increased fish and wildlife resources. In contrast, failure to do so at the Lower Atchafalaya River, Louisiana, increasingly results in dual cost. Comparison of the two projects raises serious questions about the consistency of project evaluation and cost/benefit analysis.

Descriptors: *Estuarine fisheries, *Diversion, *Planning, *Management, Public participation, Evaluation, *Cost benefit analysis, Marshes. Erosion, Seafood productivity, Louisiana, Mississippi.

Seafood productivity declines in Louisiana and Mississippi have resulted from the lack of freshwater inputs on a controlled basis into the marine estuaries. This decline prompted people in the industry to seek help in developing a project to obtain the needed freshwater inflows. A task force was established in 1973 for preliminary planning purposes, which recognized the need for evaluation of the technical, environmental, economic, financial, social, and political and legal factors involved. The task force worked with many agencies involved with water resources and obtained the support of 12 organizations and agencies representing a broad base of public support. The plans submitted to Congress were approved and referred to the Corps of Engineers for studies to be conducted. The studies are now in progress, being combined with two other freshwater studies. An initial report indicates that the monetary benefits to fish and wildlife range from $4.4-5.2 million, and that the freshwater input will substantially reduce the serious loss of Louisiana marshes. The work of the task force is to monitor progress and continue support of the project, which has been in progress for 7 years and will need a further 8-10 years before freshwater flows are obtained. THE ECONOMIC SIGNIFICANCE OF THE LONG POINT MARSH, LAKE ERIE, AS A RECREATIONAL RESOURCE,
Guelph Univ. (Ontario). Dept. of Geography.
R. Kreutzwiser.
Journal of Great Lakes Research, Vol 7, No 2, p 105-110, 1981. 1 Fig, 2 Tab, 14 Ref.

Descriptors: *Wetlands, *Economic aspects, Marshes, *Long Point Marsh, *Ontario, Canada, Wilderness areas, Wildlife, Hunting, Recreation demand, *Lake Erie.

A study was made of the recreational significance of public marshes at Long Point and Point Pelee on the north shore of Lake Erie. Emphasis was placed on estimating the economic value of the Long Point marsh as a recreational resource. The marshes under consideration occupy about 12% of the estimated 12,200 hectares of public and private marsh land on the north shore of Lake Erie. In 1978 the Long Point marsh provided opportunities for nature viewing, photography, fishing, waterfowl hunting, and canoeing for about 17,000 users. About 70% of the respondents to a questionnaire indicated that a wetland recreational activity was their primary purpose for visiting the Long Point area. In pursuing these activities, the users had a direct economic impact on the local communities through money spent there. Recreational users of the Long Point marsh spent in excess of $250,000 on gas, food, lodging and other items associated with their visit, of which about $120,000 was spent in the local area. This estimated $120,000 in local spending seems insignificant in terms of total sales in tourist-serving businesses in the area. However, tourist spending generates additional economic activity as tourist dollars work their way through the economy. In Ontario it is estimated that every dollar of tourist spending generates an additional 88 cents. On this basis, some $225,000 in local business income was generated directly and indirectly by recreational users of the Long Point marsh. (Baker-FRC)

WATER-RESOURCES INFORMATION FOR THE WITHLACOOCHEE RIVER REGION, WEST-CENTRAL FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
R. A. Miller, W. Anderson, A. S. Navoy, J. L. Smoot, and R. G. Belles.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A106929, Price codes: A07 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 81-11, 1981. 130 p, 39 Fig, 20 Tab, 94 Ref.

Descriptors: *Surface water, *Groundwater, *Water use, *Streamflow, Aquifer characteristics, Lakes, Springs, Salinity, Wells, Water yield, Transmissivity, Water level fluctuations, Water quality, Data collections, *Florida, West-central Florida, *Withlacoochee River.

Daily water use in the Withlacoochee River region in 1977 averaged about 2,005 million gallons per day, 94 percent being saline surface water used in thermoelectric power-generation cooling. The largest user of freshwater was Hernando County, using 43.02 million gallons per day. The Floridan aquifer in the region consists mostly of limestones and dolomites, and is as much as 1,500 feet thick. Transmissivities are known to be as high as 25 million feet squared per day. Yields of 2,000 gallons per minutes from 12-inch wells are possible. Although the range in fluctuations of the potentiometric surface is as great as 20 feet, no significant change has occurred since the 1930's when data were first collected. The quality of water in the Floridan aquifer is generally excellent. Saltwater is present in the aquifer near the Gulf Coast and in extreme east Marion County, near the St. Johns River. The predominant chemical type for both streams and springs is calcium and magnesium bicarbonate due to the dissolution process of the carbonate rocks. The majority of the streams have average dissolved-solid concentrations between 100 and 200 milligrams per liter, maximum-observed specific conductance between 250 and 750 micromhos per centimeter, and average total nitrogen concentrations of less than 1.2 milligrams per liter. TEXAS TO VOTE ON WATER TRUST FUND.
Southwest and Texas Water Works Journal, Vol 63, No 7, p 16, October, 1981.

Descriptors: *Financing, *Water policy, *Local governments, *Texas, Water law, Legal aspects, Loans, Water resources development.

The Texas legislature has proposed an amendment to the state constitution for establishing a water trust fund to guarantee repayment of local government water bonds and to increase the maximum interest rate on state bonds to 12%. This amendment would provide funds for badly needed water supply and flood control projects at a modest cost to the state government. Half of the excess state revenue would be placed in the water trust fund for dispersal in three forms: a loan fund, a storage and acquisition fund, and a research and planning fund. The proposal was scheduled for a vote on November 3, 1981. (Cassar-FRC)

EFFLUENT CHARGING SYSTEMS AND THEIR ADMINISTRATIVE IMPLICATIONS,
Environmental Resources Ltd., London (England).
R. Bidwell, and S. Mason.
Water Science and Technology, Vol 13, No 7, p 393-411, 1981. 3 Fig, 3 Tab.

Descriptors: *Effluent charges, *Administration, *Costs, *Water pollution control, Water quality control, Permits, Pollution taxes, Waste discharge, Wastewater discharge, Monitoring, Reviews, France, Germany, Netherlands, United Kingdom.

The present and proposed effluent charging systems in France, Germany, the Netherlands, and the United Kingdom are reviewed with attention to characteristics of effluent treatment charges and characteristics of pollution charges. Types of dischargers, methods used to levy charges, links with the permit system, and use of collected revenue are considered. A hypothetical region with 1 million population, 2000 large industrial dischargers, 8000 other non-domestic dischargers, and 25 treatment plants is used to evaluate the effects of several water pollution control programs on administrative costs. A table summarizes the administrative costs in $ million (U.S.) as follows: permit system only, 0.9-5.8; permit and charging with existing samples and analyses, 1.1-6.0; and permit and charging with additional samples and analyses, 1.2-9.8. Additional charges (in $ million U.S.) produced by the following modifications will be incurred with the above permit systems: separate effluent treatment charging and pollution charging systems, 0.07; inclusion of both large and small industrial users, 0.06; inclusion of domestic premises, 1.0: increasing the 50 water quality monitoring points to 200, 1.0. (Cassar-FRC)

RATE STRUCTURES AND DEMAND REDUCTION,
Washington Suburban Sanitary Commission, Hyattsville, MD.
R. McGarry.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 52-58. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Water rates, *Drought, Long-term planning, *Water deficit, Water shortage, *Economic aspects, *Water conservation, Industrial water use, Water supply, Water use, River forecasting, Public policy, River flow, Maryland, Prince George's County, Montgomery County.

The Washington Suburban Sanitary Commission is a state water agency that serves two counties in Maryland. It began in 1970 with an emphasis on water conservation, which was unusual at that time. The public wanted conservation planning, and the Commission responded with a four-phase program: publicity and education, plumbing code changes, a rate structure that supports conservation, and the incorporation of drought and risk management in water-supply planning. A citizen's advisory group recommended that the rate structure increase with the amount used, with the result that some people on fixed incomes now have quarterly bills of only $6-8. Drought management planning involved a careful analysis of demand and a decision that the 100-gallon per person per day concept was wrong, and that usage should be based on hookups, not population. Water records were converted to probabilities, and a three-phase emergency action plan was developed for shortages. The system was planned so that drastic measures would be incurred less than 1 percent of the time. Results of conservation program are mixed: while residential conservation has been widely practiced, participation from the industrial sector has been disappointing. Drought management and conservation broke a planning stalemate that had been in existence for 18 years. Some problems have been encountered; e.g., a public misunderstanding that water bills would decrease, a difficulty for utilities in predicting revenue, and remaining uncertainty with reservoir-operating/river flow forecast management. ANALYTICAL COST MODEL FOR URBAN WATER SUPPLY,
Municipal Environmental Research Lab., Cincinnati, OH. Drinking Water Research Div.
R. M. Clark, and R. G. Stevie.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 437-452, October, 1981. 4 Fig, 6 Tab, 14 Ref.

Descriptors: *Water distribution, *Urban areas, *Economics of scale, *Water costs, *Water supply, Water consumption, Water treatment, Water transport, Regional planning, Planning, Population density, Cost analysis, Economic aspects, Drinking water, Municipal water, Utilities.

This paper emphasizes the tradeoffs that must be considered in developing regional water distribution systems. Economies of scale of the acquisition/treatment component may be offset by diseconomies in transportation/distribution. Using the cost functions for each component, equations are developed to show the relationship between the minimum cost point for a water distribution system and the distance from the point of production. Before this point the average cost with respect to distance decreases, and after this point, it increases. Per capita consumption and absolute levels of population density have little effect on least cost system size. However, the minimum cost solution is very sensitive to population distribution. In many cases the minimum cost point is approximately 8 miles. (Cassar-FRC)

6D. Water Demand

WATER MANAGEMENT ON THE COLUMBIA RIVER,
Columbia River Basin Commission, Portland, OR.
D. Kent.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, October, 1981. p 79-85.

Descriptors: *Water management, *Competing use, *Estuaries, *Water supply, *Water demand, Fisheries, Irrigation water, Hydroelectric plants, Recreation, Navigation, Judridiction, Water policy, *Columbia River, Pacific Northwest.

The Columbia River, with its estuary and its tributaries, is the dominant Pacific Northwest water resources system. Discharges on an annual average are about a quarter of a million cubic feet per second of water at its mouth. The regions water problems stem largely from the competing uses to which the river is put. The river supplies hydroelectric power, supports ever-increasing agricultural production with irrigation development, provides transportation, maintains fishery resources and provides recreational opportunities for everyone. Already, competition between hydroelectric generation and irrigation is intense. Meanwhile, hydropower and irrigation demands are putting pressure on a third use, the fish runs. For maintaining fish runs, water must be available in adequate quantity and quality at the proper times for both the upstream and downstream passage of the fish. Jurisdiction is another source of difficulty: the Columbia River system waters within the U. S. are controlled by seven states, at least nine Federal agencies, several state organizations, and multitude of public entities, local jurisdictions, and private individuals (under permit). The result is a variety of piecemeal and conflicting policies for the use of the Columbia River water. The uses which are economically most profitable are the ones which receive the greatest consideration by the decision-makers. In the case of the Columbia, hydropower is the most important, followed by irrigation, transportation, and fisheries and conservation. (Moore-SRC)

OVERVIEW OF FRESHWATER INFLOW DEPLETIONS,
Fish and Wildlife Service, Fort Collins, CO.
K. Bayha.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 231-247. 9 Fig, 2 Tab, 2 Ref.

Descriptors: *Water resources development, *Streamflow depletion, *Water demand, *Water supply, *Estuaries, Groundwater mining, Groundwater depletion, Environmental effects, Planning, River flow.

An analysis of the accumulated depletion of streamflow in the nation's major watersheds was attempted for the first time as part of the Second National Water Assessment conducted by the U.S. Water Resources Council. This paper utilizes that data base to demonstrate the relative reduction of freshwater inflow to estuaries due to upstream water resource development. Data for normal (average) and dry (80% exceedance) year conditions are presented for 106 assessment subregions, including 30 coastal estuarine complexes. The data show that greater water use in the year 2000 will result in reduced flows to the estuaries. An exception is the Texas coast where groundwater mining augments the surface water supply. In general groundwater mining will decrease, because of the lowering of the water table and increased pumping costs. The further depletion of flows to estuaries will produce additional environmental impacts. Data should be developed so that water resource planner could link estuarine needs for freshwater inflow with instream flow needs to permit meaningful evaluation of impacts of water projects proposed in the headwaters. (Brambley-SRC)

FRESHWATER INFLOW TO THE COLUMBIA RIVER ESTUARY; A NORTHWEST REGIONAL MANAGEMENT ISSUE,
Pacific Northwest River Basins Commission, Vancouver, WA.
D. H. Kent.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 270-276. 1 Fig, 6 Ref.

Descriptors: *Columbia River, *Estuaries, *Water demand, *Water supply, *River flow, Data acquisition, Water resources development, Planning, *Cost-benefit analysis.

The Columbia River is the largest freshwater drainage system on the Pacific coast of North America, yet less is known about its estuary than about any other of comparable size in the United States. With many conflicting uses for its water (agriculture, power generation, navigation, and fisheries), the Columbia River system is unable to meet all the demands for water during periods of reduced discharge, when demand is greatest. The Pacific Northwest River Basins Commission, as the interagency regional planning organization dealing with water resource planning in the Columbia River system, has undertaken two programs designed to deal directly with this issue of instream flows. The Regional Tradeoffs Analysis Program will be evaluating and documenting competition among various water uses and the economic, environmental, and social benefits and costs (tradeoffs) which would result from alternative levels of use for competing purposes. The Columbia River Estuary Data Development Program is a $6.2 million special program with a dual purpose: to increase the understanding of the Columbia river estuary as a system, and to acquire information needed for making specific land/water management decisions. It is anticipated that the inclusion of information provided by this interdisciplinary research effort in the Regional Tradeoffs Analysis Program will provide a solid basis for predicting impacts of varying instream flows on the Columbia River estuary. A MONTHLY TIME SERIES MODEL OF MUNICIPAL WATER DEMAND,
Water and Power Resources Service, Provo, UT.
R. D. Hansen, and R. Narayanan.
Water Resources Bulletin, Vol 17, No 4, p 578-585, August, 1981. 3 Fig, 5 Tab, 16 Ref.

Descriptors: *Statistical models, *Water demand, *Time series analysis, Drinking water, Water distribution, Management planning, *Salt Lake City, Utah, Model studies.

The procedures and results of a time series analysis of factors which influence municipal water use in Salt Lake City, Utah, are presented. A multivariate time series model was formulated to study the monthly variation in municipal water demand, and a high multiple correlation coefficient and F-statistic were determined for the Salt Lake City application. Municipal water demand is determined by explanatory variables including price, average temperature, total precipitation, and percentage of daylight hours. In an ex post forecast, the model accurately predicted monthly variations. The model was also useful for predicting and studying the impact of non-structural management decisions such as the effects of price changes, peak load pricing methods, and other water conservation programs. When disaggregated time series water use data are available, the model can be applied to sector water demand data. (Small-FRC)

42-MILE WATER PIPELINE FOR COAL BOOM TOWN.

Public Works, Vol 112, No 2, p 82-83, February, 1981.

Descriptors: *Pipelines, *Steel pipes, *Water transport, Conveyance structures, Hydraulic structures, Water supply development, Water demand, Wells, Pumping plants, Water distribution, *Gillette, *Wyoming.

A 42-mile steel pipeline is under construction to supply water to 35,000 residents of the coal boom town of Gillette, Wyoming. Of the $23 million needed for the project, $12 million goes to construction, $7-$8-million is for materials, and the remainder will be used to drill eight water supply wells and construct two pump stations. The 30-inch diameter pipeline will be able to deliver 7,000 gpm to accommodate peak demands. Wall thicknesses of the 48-foot lengths range from 10-gauge to 1/4-inch. Sections of the piping are available in more than 5,500 lengths, determined by a computer system. The pipe will be shipped overland 1,150 miles from the Beall Pipe Division of Portland by truck. The contractor will use three construction crews in a leap-frogging maneuver for the bulk of the project. The average excavation depth is 8 to 10 feet, and in some spots V-shaped trenching is used. Color-coding of pipe ends provides for swift and errorless transporting and laying of pipe sections. (Geiger-FRC)

EFFICIENT GROUNDWATER UTILIZATION,

R. C. Heath.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 74-77. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Groundwater management, *Water supply development, *Long-term planning, Surface-groundwater relations, Aquifers, *Water supply, Aquifer management, Grants, Cost sharing, Economic aspects, Groundwater recharge, Water costs, *North Carolina, Projections, *Water demand.

The eastern half of North Carolina is occupied by the Coastal Plain, which contains abundant groundwater in sand and limestone aquifers and abundant surface water in major rivers that originate in the Piedmont to the west. However, groundwater levels in the deeper aquifers have been declining for more than two decades, which indicates that withdrawals and natural discharge are exceeding recharge. The development of a water management plan for the deep Coastal Plain aquifers will be one of the critical water issues in the eighties. In the Piedmont and Mountain area, there has been increasing dependence on surface-water supplies: the area's population is expected to double in the next 40 years and water use to triple. Water needs of North Carolina population and industry will require expansion of existing water supplies and the development of new supplies, both of which require federal and state assistance. In addition, conservation is needed to ensure reasonable water costs. Resources are necessary to determine how much groundwater can be developed and how to construct and test the wells needed to supply it. Assistance is available from the U.S. Geological Survey, which collects data on streamflow, groundwater, and water quality for use in the design of water systems. (Garrison-Omniplan)

6E. Water Law and Institutions

INSTITUTIONAL BARRIERS TO WATER QUALITY PLANNING AND MANAGEMENT IN THE SOUTHEAST - VOL I - TECHNICAL REPORT, PART I - INSTITUTIONAL BARRIERS,

Tennessee Univ., Knoxville. Graduate School of Planning.
G. E. Bowen, and T. R. Gangaware.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153537, Price codes: A09 in paper copy, A01 in microfiche. Report prepared for Office of Water Research and Technology, May, 1981. 184 p, 1 Fig, 12 Tab. OWRT-C-90234-U(9434)(1), 14-34-0001-9434.

Descriptors: *Urban planning, *Water quality management, *Legal aspects, *Economic aspects, *Institutional constraints, Local governments, Water pollution, Legislation.

The primary objective of the study was to make comparisons and assessments of institutional barriers and inter-agency relationships which impaired the ability of 208 areawide agencies to develop acceptable comprehensive water quality management plans within the southeastern United States. A secondary objective of the study focused on an analysis of citizen participation mechanisms employed in the development of the 208 programs, in order to develop alternative approaches for enhancing general public input into water quality management programs. The study consisted of four interrelated phases: a comprehensive literature review, a questionnaire administered to 208 areawide agencies in the southeast, a series of case studies of selected 208 areawide agencies and the administration of a delphi process questionnaire to selected individuals. The seven 208 planning areas participating in the case study phase included: Asheville, NC; Columbia, SC; Chattanooga, TN; Miami, FL; Myrtle Beach, SC; Knoxville, TN; and Orlando, FL. The major institutional barriers identified fell under four major categories: legal, political/governmental, cultural, and economic. (Gangaware-Tenn)

MANAGEMENT OF FRESHWATER INFLOW TO ESTUARIES: A LAWYER'S PERSPECTIVE,

Environmental Defense Fund, Inc., New York.
J. B. Tripp.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, October, 1981. p 65-76, 1 Tab, 14 Ref.

Descriptors: *Water management, *Legal aspects, *Estuarine environment, *Water resource development, River flow, Flow discharge, Flood plain management, Groundwater runoff, Sediments, Wetlands.

The condition of surface and ground water inflows is of critical importance where the maintenance of restoration of the chemical, physical, and biologi-

and functioning of an estuary is a recognized objective. Maintenance of freshwater inflow systems as part of an estuarine management program is hampered by three factors: Federal statutory programs which fail to recognize the interrelationships between riverine and estuarine systems; inadequate scientific knowledge of these relationships; and Federal water resource development programs that continue to promote massive alterations of riverine systems, including floodplain vegetation. Although existing statutory programs can be effective in controlling discharges of some pollutants into surface or ground waters entering estuaries, they are not so effective at controlling major alterations of fresh-water inflows, such as hydrologic modifications, alterations in sediment patterns and loss of riverine wetland floodplain vegetation, which affect estuaries. These legal constraints are also a reflection of the state of scientific knowledge about riverine-estuarine relationships. Increased scientific knowledge about these relationships will be useful in strengthening the effectiveness of existing programs to combat degradation of freshwater flows to estuaries. (Moore-SRC)

FEDERAL AND STATE COASTAL ZONE MANAGEMENT EFFORTS DIRECTED AT ESTUARIES AND FRESHWATER INFLOW,

National Oceanographic and Atmospheric Administration, Washington, DC. Office of Coastal Zone Management.
R. B. Mieremet.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131426, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980, Fish and Wildlife Service, Office of Biological Services Rept FWS/OBS-81/04, Vol I, October, 1981. p 96-102, 1 Ref.

Descriptors: *Estuaries, *Water management, *Coastal zone management, *Government interrelations, Economic aspects, River flow, Environmental effects, Salinity, Priorities.

The Coastal Zone Management Act was passed because of concerns over estuaries and other coastal resources. Financial assistance and management tools are providing incentives to state and local governments to begin to address problems associated with freshwater inflows or the lack thereof. Special area management planning, enforceable policies, and improved coordination are being brought to bear on the decisionmaking process. Mitigation and restoration projects can help alleviate some of the past problems. While coastal zone management has many significant tools which are being used and will be used in the future to address problems relating to freshwater inflows to estuaries, it obviously can not cure them all. Some states have included all or almost all of their state as the coastal zone because of the watershed principle, while others stop at the 5 ppt salinity line of the estuary. Extra efforts are needed to ensure good coordination of government actions. Coastal zone management often requires some compromises between preservation and development. It is likely that there will be times when the importance of freshwater inflow will get lost in the priorities where there are conflicting interests. (Moore-SRC)

AN OVERVIEW OF TEXAS LAW, POLICY, AND AGENCY ACTIONS CONCERNING ESTUARINE INFLOW,

Wildlife Management Inst., Dripping Springs, TX.
M. T. Walton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 255-269. 52 Ref.

Descriptors: *Estuaries, *Legislation, *Jurisdiction, *Environmental protection, *Water demand, *Water use, Environmental policy, Permits, Priorities, Water management, Appropriation, *Texas, Water law.

Texas water law has been influenced by several legal traditions, but only in 1975 was a law passed which recognized the need to preserve estuarine inflow and authorized studies to determine inflow needs. The law is administered by the Water Rights Commission. However, the law has not been applied towards the development of an active policy or in strong agency action to preserve estuarine inflows. In three cases the Commission allowed permits for projects in which estuarine inflows were not assured. The Texas Parks and Wildlife Department has participated in permit hearings and adjudication this participation has declined, and to some extent has been taken over by the Department of Water Resources. This department has provided a data base on which to base reservation of freshwater inflos. These inflows have the lowest priority of all demands on water resources. Neither the Texas Water Plan nor the Texas Coastal Management Plan has definite provisions for estuarine inflow preservation. Since some basins are already overappropriated, and each new appropriation has an environmental effect, strong defense of the present law and additional regulations would seem to be necessary. (Brambley-SRC)

SCIENTIFIC PROGRESS AND DETERIORATING ECOSYSTEMS; SAN FRANCISCO BAY AND THE 1970'S,

Fish and Wildlife Service, Sacramento, CA.
P. A. Meyer, and W. T. Davoren.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 277-287. 27 Ref.

Descriptors: *San Francisco Bay, California, *Ecosystems, *Estuaries, *Bays, *Water supply, *River flow, Environmental effects, Selective withdrawal, Legislation, Water quality, Shore protection, Data acquisition, Prediction.

Considerable progress has been made by planners, scientists, and environmental managers of the 1970's in identifying the uncertain and to a considerable degree unquantifiable, nature of bay/estuary ecosystems, and in offering improved prescriptions for their protection. At the same time, this progress in understanding theory and making prescriptions has been accompanied by continued stressing of the bay systems and in some instances by their further deterioration. In the San Francisco Bay area these stresses have resulted from continued and increased upstream withdrawals, and it is projected that these withdrawals will continue. No gains were made in the bay fill and shoreline control programs, and San Francisco Bay was excluded from jurisdiction of applicable legislation. Municipal and industrial discharges to the bay were reduced as a result of applying national and state programs, rather than as a response to the needs of the bay. It is proposed that studies be conducted with emphasis on the metaphysical or value relationships of the bay, instead of the procedural or practical, and that studies be sponsored by persons other than those who have a direct interest in the outcome. DECISION-MAKING CONSTRAINTS IN THE POLICY DEVELOPMENT AND ADMINISTRATION OF WATER RESOURCES IN WEST VIRGINIA,

West Virginia Univ., Morgantown. Water Research Inst.
D. G. Williams, and D. C. Menzel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153701, Price codes: A04 in paper copy, A01 in microfiche. Information Report 16, 1981. 65 p, 2 Fig, 20 Tab, 37 Ref, 2 Append. OWRT-A-032-WVA(4), 14-34-0001-7103.

Descriptors: *Administrative decisions, Attitudes, *Decision making, *Judicial decisions, Motivation, *Policy making, *Political constraints, *West Virginia, Administrative regulation, Institutional constraints, Law enforcement, Legal aspects, Legislation, Political aspects, Public policy, Social aspects, Water law, Water policy.

This study investigated the decision-making constraints of water-resource policy and administration in West Virginia. The findings indicate that internal administrative processes and organizational arrangements often tend to hamper coordination and fragment responsibility. Much of the policy enforcement machinery is dependent on those who operate in a context not supportive of the policy and over whom the responsible organization has no direction. The findings also indicate that water-quality management is in competition with many other policy areas at the gubernatorial level. A survey of state lawmakers revealed that legislators perceive the state to place a lower priority on environmental protection compared to education, highways, health, and labor. Legislators perceived the state executive to assign water-pollution control in particular to the middle of other environmental priorities. With respect to the priorities of the legislators themselves, environmental problems and water pollution were ranked higher. Legislators evaluated water-pollution-control laws as adequate but enforcement as less than adequate. The survey of state legislators also indicated that legislative expertise and leadership are not well developed in the water-resource field.
W82-02173

ASSESSMENT OF THE NATIONAL WATER QUALITY MANAGEMENT PROGRAM, VOL. I, 106 PROGRAM OVERVIEW, PLANNING AND STANDARDS.

Association of State and Interstate Water Pollution Control Administrators, Washington, DC.
August 1981. 38 p, 1 Fig, 3 Tab.

Descriptors: *State jurisdiction, *Water quality standards, *Federal jurisdiction, *Waterpollution prevention, Public policy, Dredging, Political aspects, Hazardous materials, Law enforcement, Legal aspects, Water quality.

This report recommends reforms in the Federal Clean Water Act as a means of coping with declining program resources and increasing requirements. The ASIWPCA recommends that administration of the Clean Water Act be delegated to states, and federal efforts should focus on results, not procedures, but should continue to provide $118 million in the funding estimated to be needed for the states to administer the Act. In terms of water quality, it is recommended that there be a simplified standards-setting process to expedite the development of reasonable standards at minimal costs. States should have the primary role in establishing standards, with the burden of proof for disapproval of state water quality standards resting with the U.S. Environmental Protection Agency. Water quality standards should be reviewed and revised on a five-year cycle, and toxicity criteria should be established in cases where there are harmful presences and when public health is endangered. States should have the opportunity for input to federally negotiated international treaties where they will be expected to implement the agreements. The water quality management planning process, supported under Section 208 of the Clean Water Act, should be integrated with other elements of the water program, e.g., 303(e) of the Act, which concerns basin planning. Regarding clean lakes, funding emphasis should be placed on lake restoration to preserve lakes identified in each state. Section 404, which establishes a permit program for discharge of dredge and fill materials, is

viable only with adequate funding to ascertain environmental, water quality and economic needs. (Garrison-Omniplan)

ASSESSMENT OF THE NATIONAL WATER QUALITY MANAGEMENT PROGRAM, VOLUME 2: CONSTRUCTION GRANTS.

Association of State and Interstate Water Pollution Control Administrators, Washington, DC.
August, 1981. 71 p, 7 Fig, 7 Tab.

Descriptors: *Grants, *Wastewater treatment, *Engineering, *Sanitary engineering, *Government finance, Project planning, Government supports, Municipal wastes, Municipal wastewater, Wastewater treatment, Economic justification, Economic aspects.

The Construction Grants Program grew out of the recognition that inadequate municipal sewage treatment was a major cause of the nation's water pollution. However, the program has been plagued with financial instability. The Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) recommends that Congress provide adequate multi-year authorizations and advance appropriations consistent with the rate of progress desired, mandated cleanup deadlines and national fiscal constraints. The Association also recommends that the multi-year funding system should consider actual overall water pollution control needs within each state and the rate at which locally developed projects are expected to need funding. ASIWPCA advocates maintaining 205(g) funding at a level of at least $100 million per year and limiting use to those activities currently eligible for 205(g) funding. These funds should not be required by the Federal government to be used as a substitute for inadequate 106 or 208 funds. Other recommendations are: (1) delegated states should be provided more freedom and flexibility in determining and approving construction grant projects; (2) the U.S. Environmental Protection Agency should delegate to the regional level the authority to approve deviations to grant regulations upon justification from states; (3) advanced treatment review should be conducted at the state level rather than the federal level; (4) statistics used for formula data must have proven validity; (5) reserve treatment plant capacity to year 2000 population should remain eligible for federal financing. (Garrison-Omniplan)
W82-02182

ASSESSMENT OF THE NATIONAL WATER QUALITY MANAGEMENT PROGRAM, VOLUME 3: INDUSTRIAL AND MUNICIPAL CONTROL.

Association of State and Interstate Water Pollution Control Administrators, Washington, DC.
August, 1981. 35 p.

Descriptors: Municipal wastes, Industrial wastes, *Wastewater treatment, *State jurisdiction, *Federal jurisdiction, *Political aspects, Municipal wastewater, Legal aspects, Government finance, Economic aspects, Administrative agencies, Administrative decisions, Effluents.

Control of municipal and industrial point sources of pollution, together with Construction Grants Management, comprise the major part of the State water programs. The Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) examined the status of the water program regulated by the Clean Water Act and concluded that coordination of the National Pollutant Discharge Elimination System (NPDES) between the states and the U.S. Environmental Protection Agency is in need of reform. The recommendations are: (1) the 1983 goal of fishable/swimmable waters should be extended to the year 1990, and zero discharge should be considered an unrealistic goal; (2) EPA review of individual state actions should be replaced with auditing for results; (3) substantial streamlining of the NPDES program should include deregulation of deminimous sources, elimination of national public participation requirements, and streamlining of EPA compliance and enforcement procedures; (4) primary enforcement authority should be exercised by states; (5) local governments that have attempted to comply with current deadlines should not be penalized for delays encountered for lack of construction grant funds; (5) compliance evaluation should focus on substantial violations of water quality standards and effluent limitations; (6) the EPA should continue developing national categorical standards for pretreatment to be imposed only when states do not choose to use their own program equivalent; (7) influent, effluent and sludge from publicly owned treatment works (POTWs) should be characterized by states and POTWs, and the baseline industrial survey continued. (Garrison-Omniplan)

SUPERFUND: WHAT A MESS,

Chelsea International Corp., Washington, DC.
W. C. Savage.
Association of State and Interstate Water Pollution Control Administrators, Washington, DC., August 12, 1980. 12 p, Append.

Descriptors: *Hazardous materials, Pollutants, *Legislation, *Liability, *Federal jurisdiction, *State jurisdiction, Decontamination, Economic aspects, legal aspects, Cleaning, Cleanup, Political aspects, Contamination.

On June 13, 1979, the Carter Administration released a proposal to amend the Clean Water Act and the Solid Waste Disposal Act. The proposal would establish liability and compensation systems to respond to health and environmental damages caused by oil and hazardous waste spills. The administration's proposal along with initiatives introduced by other congressmen have been partially included into three 'Superfund' bills now seriously being considered by Congress: HR 85, HR 7020, and S 1480. All three bills proposed the establishment of a large fund to assure swift response to pollution incidents using funds from chemical and oil company fees or taxes on production, and all allow delegation of authority to the states. Important differences are that HR 85 establishes two funds--one for oil spills and one for hazardous substance spills; HR 7020 and S 1480 limit liability to the proportional share of causation; S 1480 does notinclude oil spills and has no limits on liability, but provides victims access to Federal courts with initial presumption in their favor to avoid premature dismissal of cases. The bills vary widely in the level of autyority delegated to states. Liability provisions, fund size, and mechanisms for disbursing the funds are being debated. EPA's estimates to clean up abandoned sites alone range from $38 to $44 B. At the time of writing, it appeared unlikely that Superfund legislation would be passed in the Congressional session in progress, since only 35 days remained and jurisdictional disagreements might not be settled in time. Whatever legislation is passed, the question is raised whether the EPA can handle another major law. (Garrison-Omniplan)
W82-02184

COMPLIANCE STRATEGY FOR CLEAN WATER.

Association of State and Interstate Water Pollution Control Administrators, Washington, DC.
May, 1981. 8 p.

Descriptors: *Legislation, *Federal jurisdiction, *Water quality standards, Water pollution prevention, Waste treatment facilities, Wastewater facilities, Pretreatment of water, Industrial wastes, Water treatment, Economic aspects, Grants, Hazardous materials, Pretreatment standards.

This paper presents ASIWPCA's compliance strategy for three principal aspects of the Federal Clean Water Act: (1) publicly owned treatment works (POTWs), (2) industrial dischargers, and (3) pretreatment (indirect industrial sources). The suggested strategy for POTWs includes maintaining the funding for construction grants through the FY82 appropriation period, and allowing states the option of reducing the federal cost share to less than 75 percent of the eligible project cost. The EPA should redefine 'secondary treatment' to eliminate the present 85-percent removal of pollutant requirement and allow the maximum range of treatment technologies to be utilized. Provisions in Section 205(g) should be structured so that states continue to receive funding under state management assistance grants of at least $100 million per year. POTWs should be able to derive their compliance requirements of effluent limitations and schedules from approved state strategies to ensure coordination with the permit process and the availability of construction grant funds. Industrial dischargers should continue to be required to follow 'BTP' based controls as the minimum national treatment requirement. However, the approach for 'BCT' should be modified for conventional pollutants to include water quality based equivalency determinations for treatment. EPA should develop national categorical standards for 'BAT' to improve control of toxic pollutants. National categorical standards for pretreatment should be developed by EPA, but some states should be waived from pretreatment requirements when other controls are adequate. (Garrison-Omniplan)

LAKE TAHOE PRESERVATION BILL ENACTED.

National Parks, Vol 55, No 2, p 23, February, 1981.

Descriptors: *Lake Tahoe, *Legislation, *Watershed management, Legal aspects, Water law.

Legislation was enacted to preserve Lake Tahoe (PL96-586) during the closing days of the 96th Congress. The bill provided for the sale of Bureau of Land Management property around Las Vegas, with 85% of the proceeds from the sales to be used to buy land in the Lake Tahoe Basin. The bill was weakened by two amendments. The first removed the Secretary of Agriculture's authority to acquire lands to protect air and visual qualities. The second required that before any land could be condemned, the Tahoe Regional Planning Agency would have to concur. The bill is a positive step toward resolving the lake's problems. (Small-FRC)

ADJUSTING GOVERNMENT ROLE IN WATER LAW.

Southwest and Texas Water Works Journal, Vol 63, No 7, p 10-11, October, 1981.

Descriptors: *Water policy, *Government supports, *Financing, Water quality control, Water law, Government finance, Grants, *Arkansas.

Changing water policy as applied to Arkansas was the subject of a talk by Congressman J. P. Hammerschmidt before the Arkansas Water Managers Association August 1981 meeting. The Water Policy Board proposed in H. R. 3432 is intended to enhance state-federal cooperation for all water policy issues. A major help in meeting national and Arkansas water quality goals has been the Clean Water Act's Contruction Grants Program, which helps fund sewage treatment works up to 75% (formerly limited to 30%). Under this program Arkansas received $114 million toward compltion of 193 projects, with another $114 proposed for 147 active projects. Under the new administration, regulatory reform and cost cutting have begun. Less money will be availale from the federal government. Therefore local governments willhave to consider other long-term options for local projects. Grants for Arkansas for 1982 have been cut from $5.2 million to $2.3 million and loans from $17 million to $6.9 million. The Congressman pledged cooperation in developing workable, reasonable, practical federal water policy during the national period of reevaluation. (Cassar-FRC)

SUPREME COURT CLARIFIES WATER ACT REQUIREMENT,
M. R. Higgins.
Natural Resources Journal, Vol 21, No 3, p 607-614, July, 1981.

Descriptors: *Judicial decisions, *Water pollution control, *Effluent standards, Federal Water Pollution Control Act, Legal aspects, Water law, Water pollution prevention, Quarries, Environmental Protection Agency v. National Crushed Stone Association, Supreme Court.

In EPA v. National Crushed Stone Association, the Supreme Court upheld that the EPA was not required to consider the economic effect of the effluent limitation standards on the individual plants requesting variances from the first-phase or Best Practicable Technology (BPT) standards. The Court supported Congress' conclusion that water pollution prevention and control must be accomplished in spite of some possible plant closings. The Court decision narrows the possibilities for obtaining BPT variances while allowing enough flexibility to handle individual situations not considered when the EPA drew up the first-phase regulations. DO STATE WATER ANTI-EXPORTATION STATUTES VIOLATE THE COMMERCE CLAUSE. OR WILL NEW MEXICO'S EMBARGO LAW HOLD WATER,
C. B. Stetson.
Natural Resources Journal, Vol 21, No 3, p 617-630, July, 1981. 93 Ref.

Descriptors: *Water resources development, *State jurisdiction, Legal aspects, Export, Water demand, Water supply, *New Mexico, Water transfer.

At least 14 states and the District of Columbia have statutes directly prohibiting or regulating the export of state water, while other statutes indirectly regulate such export by narrow definitions of beneficial use or by legislation designed to protect the needs of the area in which the water originates. Increased demands for water and conflicting water law principles of neighboring states lend an element of tension to the water confrontation. The outcome of a suit filed by the city of El Paso against the New Mexico State Engineer, may be a landmark decision in the field of natural resources law as water supplies continue to dwindle, demands continue to increase, and states become even more concerned with protecting their citizens and conserving their local resources. After reviewing several other decisions as well as state property rights, it is concluded that any water rights in New Mexico which were vested prior to the passage of the non-exportation statute of 1953 could not be retroactively changed or controlled without state proof that such control is needed for the public good. However, prospective non-exportation statutes may be valid if they meet the following criteria: the sovereign power encompasses state waters, there is strong local interest in restricting exports, the legislation is non-discriminatory, and the Congress has not pre-empted the field. The New Mexico statute being challenged at present does not prohibit the exportation of all water, merely groundwater, and even that prohibition is not absolute, as it allows for the exportation of groundwater for designated uses. WATER RIGHTS ON INDIAN ALLOTMENTS,
D. H. Getches.
South Dakota Law Review, Vol 26, No 3, p 405-433, Summer, 1981.

Descriptors: *Water rights, *Allotments, *Indians, Water law, Water policy, Reservation doctrine, Political aspects, Social aspects, Legal aspects, Appropriation, Treaties, Judicial decisions, Leases.

Water rights on parcels of Indian reservation land allotted or leased to individuals are not expressly defined by any statute or other source. A problem developed when individual lots were leased to Indians for agricultural development, lease, or sale. Surplus lands on the reservations were opened to non-Indians for homesteading. The courts have long recognized that Indian tribes have special reserved water rights, exempt from state law and the requirements for continuous use. This paper concludes that no reserved rights may be held by individuals, but the allotees may use some of the rights during the period of trust. A solution in harmony with the objective of the General Alotment Act and Indian treaties would recognize that allotted land passing out of a trust period has water rights based on the dates and quantities of appropriations made on the land during the trust period. THE EFFECT OF EEC DIRECTIVES ON WATER SUPPLIES,
A. W. Kenny.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 1, p 42-49, January, 1980. 8 Ref.

Descriptors: *Water supply, *Administration, *Operating policies, *Economic effects, *Water pollution, Rivers, Effluent limitations, Water quality, Drinking water, Trace elements, Pollutants, Contamination, Water treatment, Cost analysis, *Europe.

The First Environmental Programme of the EEC (European Economic Community) is described. In regard to the aqueous environment, it provides for (1) standardization of methods of sampling and analysis; (2) preparation of objectives; (3) determination of standards for pollutants; (4) harmonization of measures to combat pollution from certain industries; (5) measures to eliminate toxic or persistent waste; and (6) measures to combat pollution in certain zones of common interest. Additional directives address trace substances, drinking waters, and industrial effluents. These are areas where agreement among the member States has been relatively easy and unpublicized. More controversial measures will be dealt with in the future. (Titus-FRC)

REASONABLE GROUNDWATER PUMPING LEVELS UNDER THE APPROPRIATION DOCTRINE: THE LAW AND UNDERLYING ECONOMIC GOALS,
D. L. Grant.
Natural Resources Journal, Vol 21, No 1, p 1-36, 1981. 170 Ref. OWRT-A-066-IDA(2), 14-34-0001-0114.

Descriptors: *Legal aspects, *Water rights, Legislation, Cost-benefit analysis, *Groundwater management, Wells, *Pumping, Groundwater.

Two extreme approaches exist to the groundwater pumping level issue. The first is that well owners have no protection whatsoever in their diversion systems and each must pay his own cost of coping with declining levels. According to the second, existing appropriators are absolutely protected in their historic diversion systems and have injunctive or damage remedies against interference by junior users. Today, the appropriation doctrine states (western United States) have opted for a middle ground of reasonable pumping level standard. Modern resource allocation literature recognizes the impact on allocation decisions of social goals, as well as the economic efficiency considerations. Hydrologic aspects of the pumping level issue must be considered along with available groundwater management tools and the diverse factual situations in which pumping level problems can arise. Overall, the existing pumping level statutes are incomplete in listing factors, weighting them, and declaring specific policy. Further guidance on economic and other factors must be obtained by searching for the goals that underlie the statutes and by drawing on ancillary statutes. (Baker-FRC)

MUNICIPAL NEEDS,
North Carolina League of Municipalities, Raleigh.
D. Reynolds.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 6-9. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Municipal water, *Long-term planning, *Regional planning, Projections, Jurisdiction, Administrative decisions, Decision making, Water resources development, Potential water supply, Economic aspects, Site selection, Groundwater management, *North Carolina.

Local governments need the assistance of state and federal agencies to provide clean water, to protect and preserve current water supply sources, and to regenerate those that are below standard. Five major municipal needs are: (1) Statewide planning. Local governments depend on states to provide comprehensive water resource planning programs with a mechanism to reserve prime impoundment sites for future use and a coordination of groundwater resources. (2) An advocacy role regarding local municipalities. When the state adopts this stance rather than one of a regulator, problems can be solved more quickly and costly delays in project schedules can be avoided. (3) Project scoping and planning. States can develop broad plans of action with individual steps identified to assist local government decision makers who may have limited staff or lack of knowledge of state and federal agencies. This type of broad outline will greatly increase the probability of success of projects. (4) Technical assistance. This could include training of water treatment plant operators to assist them in keeping pace with changing technology, or assistance in meeting the requirements of the Safe Drinking Water Act, in identifying conservation benefits, and in developing programs to implement conservation. (5) Funding assistance. Municipalities need help in identifying sources of grants and funds and making maximum use of those available. (Garrison-Omniplan)

RECYCLING,
North Carolina Department of Natural Resources and Community Development, Division of Environmental Management.
C. Batten.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 25-27. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Recycling, Waste recovery, *Water reuse, *Wastewater renovation, Municipal wastewater, Industrial wastewater, Water use, Grants, Economic aspects, Planning, Political aspects, Reclaimed water, Water reclamation, *North Carolina.

Water conservation and wastewater reuse and recycling have generated great interest in recent years because of a shortage in water supply, the high cost of wastewater treatment and disposal, and federal funding incentives for recycling and reuse. In the 1977 Amendments to the Federal Water Pollution Control Act of 1972, 2 percent of funding was set aside to provide a 10 percent bonus grant for 'innovative' and 'alternative' projects; the latter were defined as proven methods for reclaiming and reusing water, recycling wastewater constituents, eliminating pollution discharge, or recovering energy. The alternative process most used in North Carolina has been the land application of wastewater. Two projects are

in operation, three or four are funded, and about twelve more are in the proposal stage. The recycling of wastewater involves the need for an administrative and legal framework, economies in recycling and reuse, the risk to public health, and the social impact. A project under review for recycling in North Carolina would cost about $350,000 and involve the use of wastewater effluent as a scrubber for an incinerator. A possible type of project for the future is deep-well injection to reduce salt-water encroachment. Industrial wastewater recycling has had a better record than that of municipal wastewater. APPALACHIAN REGIONAL COMMISSION AND THE COASTAL PLAINS REGIONAL COMMISSION,

North Carolina Department of Natural Resources and Community Development, Office of Intergovernmental Relations.
J. Booth.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 33-35. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Grants, *Financing, *Municipal water, *State jurisdiction, *Economic feasibility, Public investment, Legislation, Federal jurisdiction, Political aspects, Economic aspects, Regional planning, Planning, *North Carolina.

This report summarizes the federal grant programs administered by the Office of Intergovernmental Relations in North Carolina. Four major programs are: the HUD 701 Comprehensive Planning Program, which encompasses the regional planning activities of Councils of Government and regional planning commissions; the Appalachian Regional Commission (ARC), which operates in 29 western counties; the Coastal Plains Regional Commission, which operates in 45 eastern counties; and Section 304 of the Economic Development Administration (EDA), which makes a small discretionary fund available to each state governor to supplement selected EDA grants. Federal budget cuts may seriously affect some of these, such as the ARC, which was funded for $41 million in FY 81 but is marked for zero funding in FY 82, although a funding extension may carry them until September 1981. The CPRC is tied in with EDA legislation that is in effect only until December 1980; its future is also unclear. In all of the programs, the basic philosophy and priorities are for projects related to economic development, such as waterline extensions to an industrial park or a future industrial site. Both the ARC and CPRC programs supplement community development activities by providing a maximum of 80 percent total federal funding after other sources are already signed on to a local project. (Garrison-Omniplan)

TRENDS IN STATE AND FEDERAL POLICY ON WATER SUPPLY MANAGEMENT,

North Carolina Department of Natural Resources and Community Development, Office of Water Resources.
J. Morris.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance. 1980. p 43-51. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: Grants, Long-term planning, Economic aspects, *Cost-sharing, *Regional planning, *Resources development, Federal jurisdiction, Public policy, *Water policy, Jurisdiction, River basins, River regulations, Political aspects, *North Carolina, Water supply, *Water management.

The manner in which state and federal assistance is given to local water supply agencies is very much under re-examination. On the state level, a study carried out in North Carolina by the Legislative Commission on Alternatives for Water Management yielded the conclusion that regional water management has many benefits and can be organized in two ways: A state water authority could develop water supplies and provide wholesale supplies to local governments, or a river basin commission could be created in each of the state's major river basins which would have water management responsibilities and some taxing or revenue-raising powers. Another priority on the state wells is for the legislature to review the future of the Clean Water Bond program, so communities know what funding they might expect. On the federal level, President Carter's water policy incorporated water conservation regulations and incentives in almost all federal programs that have any impact on water supply or water storage. The current picture on water policy is uncertain because there is a difference of opinion as to the value of grants to local agencies. One view is that local agencies need to be self-sufficient. Another is reflected in the Domenici-Moynihan bill, S.1641, which provides flexibility on the state level and perhaps less red tape in Washington. The paper reviews pending legislation in Congress and possibilities for federal funding of local projects, as well as changing attitudes about various approaches to water management at the federal level.

NEW DEVELOPMENTS IN WATER RESOURCES MANAGEMENT FOR LOCAL GOVERNMENTS AND INDUSTRIES,

North Carolina State Univ. at Raleigh. Dept. of Psychology.
F. J. Smith.
In: Proceedings of North Carolina Conference on Water Savings and Water Supply Assistance, 1980. p 84-94, 6 Tab. North Carolina Department of Natural Resources and Community Development, Raleigh.

Descriptors: *Water resources development, *Administrative regulations, *Public opinion, Public policy, Water quality management, Water supply development, *Water conservation, Grants, Water permits, Federal jurisdiction, Quality control, Management planning, State jurisdiction, *North Carolina, *Water management.

Surveys of water managers and industrial and residential users in 54 North Carolina communities reveal that the highest-ranking problem for users is water quality; management is more concerned with water-supply expansion and difficulties with state and federal water authorities. While it is not entirely surprising that water professionals have a different view of water problems than water users, it is important that water management understand those differences. There were some misperceptions by water managers regarding community attitudes on fundamental issues of water management; with training, managers can identify citizen priorities. Conservation activities were numerous in the communities surveyed. The most welcome and useful technical assistance provided to local water managers is nonstructural in nature, such as for grantsmanship, regulatory compliance, permit applications, personnel training, and general system improvements such as leak detection and quality control. There is some wariness among water users toward inviting such assistance, particularly from public agencies that also have regulatory functions. A modern water management information system was developed that (1) enumerated information elements relevant to water system planning and operations, (2) categorized information in general systems concepts, and (3) submitted categorized information to the 54 water system managers for evaluation. It was found that overall information to support comprehensive water management planning is most needed. (Garrison-Omniplan)

SALINITY FORUM: WHAT. HOW. WHY,

Utah Div. of Water Resources, Salt Lake City.
D. F. Lawrence, and B. C. Saunders.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 453-459, October, 1981. 1 Fig.

Descriptors: *Saline water, *Water policy, *Water quality control, *Colorado River Basin, Political aspects, Legal aspects, Institutions, Irrigation water, Mexican Water Treaty, Water quality standards, Legislation, Regional planning, Planning, River basins, Water management.

The Colorado River Basin Salinity Forum, an interstate organization, was created in 1972 to consider the problem of salinity, experienced in the lower basin but caused by withdrawals and return irrigation water in the upper basin. The forum's initial task was to establish numerical criteria for salinity in the basin and to develop a plan of implementation to meet the water quality criteria. It became apparent that the goal could be reached by: (1) minimizing salt pickup from future developments and (2) reducing present salt inflow to the system from natural and man-made sources. Although future development can be easily regulated by design criteria, alteration of existing projects would require substantial funds. The Salinity Control Act authorized construction of salinity control projects with 75% federal money and 25% from the states. The forum-recommended water quality standards and implementation plan were adopted by the states and approved by the EPA. Presently the forum monitors all salinity control programs, develops policy statements, and assists the EPA in defense of state salinity standards. The forum has been successful in spite of the conflicting interests of the seven states involved because all members are committed to a clearly-defined mission. (Cassar-FRC)

STRATEGIES FOR THE MANAGEMENT OF ESTUARIES,

Texas A and M Univ., College Station. Dept. of Oceanography.
R. M. Darnell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche.
In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 434-447. 6 Fig, 1 Tab, 5 Ref.

Descriptors: *Estuarine environment, *Environmental policy, *Management planning, *Ecosystems, Salinity, Institutional constraints, Legislation, Jurisdiction, Environmental effects, Water quality.

Nationwide, the quality of estuaries has declined, and management strategies are required to restore their quality to past levels. The estuarine manager is the central figure in the system, receiving information from a variety of sources to formulate policy decisions and operation decisions, and initiating action which may be regulation (passive) or intervention (active). Both regulation and intervention may be directed to local or upstream conditions. These actions may be in the form of zoning, permits, or lease and purchase. The goal of a

healthy estuarine environment requires that conditions be maintained for those organisms that require low salinity, high salinity, are intermediate or tolerant of a range of salinities, and those which migrate through the estuary. The achieving of these goals is hindered by the absence of authorities with unambiguous control over estuaries, absence of legal tools for use by agencies, and absence of information on individual estuaries and watersheds. Because of the interstate nature of estuaries, there must be strong Federal involvement in their management. In the absence of such involvement, it is essential that the estuarine effects of upstream developments be considered in environmental impact statements, and that the cumulative effects of many small projects be considered. INTERACTIVE NONSTRUCTURAL FLOOD-CONTROL PLANNING,

Hydrologic Engineering Center, Davis, CA.
D. T. Ford.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No. WR-2, p 351-363, October, 1981. 2 Fig, 1 Tab, 6 Ref.

Descriptors: *Alternative planning, *Flood control, *Computer programs, Flood damage, Flood plain management, Flood protection, Data storage and retrieval, Information systems, Planning, Flood insurance, Nonstructural alternatives, Cost-benefit analysis, Santa Fe, New Mexico.

The Nonstructural Analysis Package, developed by the Hydrologic Engineering Center, U.S. Army Corps of Engineers, reduces the data handling time in the evaluation of nonstructural flood control alternatives. The package consists of two computer programs. The preprocessor program manipulates hydrologic, hydraulic, economic, and engineering data to derive indices that quantify the existing flood hazard for each structure or group of structures, as well as creates a random access data bank organized by stream reaches. The Interactive Analysis program retrieves, displays, and manipulates data and recomputes the flood hazard indices for evaluation. The method is illustrated with the Santa Fe, New Mexico, nonstructural flood control plan. It was easily used by persons with little computer utilization experience. The rapidly-produced alternatives were evaluated for social and political feasibility by the user, based on information gathered from persons living in the affected area. The recommended flood control plan obtained from this procedure is: (1) remove certain flood plain structures and covert property to park land, (2) replace two bridges, (3) clear the river channel in selected places, (4) construct a park walking wall, (5) construct small walls around certain structures, (6) buy flood insurance, (7) regulate flood plain land, and (8) plan for assistance in future floods. Although the expected cost of implementing the measures is $540,000 and the present value of damages is $266,000, elements of the plan were recommended for implementation. (Cassar-FRC)

AN ASSESSMENT OF CURRENT STANDARDS FOR SELENIUM IN DRINKING WATER,

Kirkham Michael and Associates, Omaha, NE.
M. J. Hammer.
Ground Water, Vol 19, No 4, p 366-369, July/August, 1981. 22 Ref.

Descriptors: *Selenium, *Drinking water, *Water quality standards, Reviews, Standards, Trace metals, Water treatment, Toxicity, Public health, Water pollution effects, Water pollution sources.

Current standards for selenium in drinking water, 10 micrograms per liter, are too stringent, according to a study of published literature on health effects of Se and the distribution of Se in natural waters. Although both deficiency and toxicity of Se are possible, neither is apparent in the U.S. population. The National Academy of Sciences recommends a provisional daily allowance of 50-200 micrograms per day. The average daily intake of Se by the American population is estimated at 200 micrograms per day. Minor health affects may appear at an intake of 500 micrograms per liter per day. The only known case of human poisoning from Se in drinking water occurred in an isolated family whose water supply contained 9 mg per liter Se. Their symptoms of lassitude, hair loss, and fingernail abnormalities disappeared upon changing water supplies. Se occurs naturally in foods, e.g., at up to 5 mg per kg in bread. In 43 samples of municipal water, Se levels ranged from 0.1 to 400 micrograms per liter. One well in Nebraska had a concentration of 480 micrograms per liter. Se cannot be effectively removed from water by conventional treatment methods; ion exchange, reverse osmosis, and electrodialysis are satisfactory, but prohibitively expensive. (Cassar-FRC)

DEVELOPING DAM-BREAK FLOOD ZONE ORDINANCE,

Corps of Engineers, Savannah, GA.
G. F. McMahon.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 461-476, October, 1981. 3 Tab, 29 Ref.

Descriptors: *Flood plain zoning, *Model studies, *Flood forecasting, *Ordinances, Flood plain management, Flood plains, Flood hydrographs, Dams, Flood routing, Flood waves, Flood spreading, Legal aspects, Nonstructural alternatives, Planning, Dam failure.

The formulation and enforcement of dam-break flood zone ordinances in Gwinett County, Georgia, will entail new problems not usually found in typical flood-zone regulations. The problems will occur as a result of inexperience in developing and interpreting ordinances, nonstandardization of methods and assumptions utilized to delineate dam-break flood zones, and conflicts of interest in the zoning process. The Georgia Safe Dams Task Force has tried to implement practical standards for estimating dam-break flood zones for a number of dams. Guidelines for determining flood areas are presented which apply to six important aspects of dam-break flood forecasting. These guidelines concern mode of failure, computation of the outflow discharge hydrograph produced by the breach, routing of the outflow hydrograph, determination of realistic initial and boundary conditions for dam-break flood-wave propagation, assumptions to be made in the case of domino-type failures, and data required by various methods. The Task Force has also sought to simplify the model ordinance to facilitate its adoption and enforcement. (Geiger-FRC)

Descriptors: *Consumptive use, *Estuarine environment, *Salinity, *Water circulation, Model studies, Hydraulic models, Simulation, Drought, *Chesapeake Bay, Freshwater inflow.

Chesapeake Bay is the largest estuary on the Atlantic coast of the U. S. and one of the more important estuaries in the world. It is nearly 200 miles long and varies in width from 3 miles to 30 miles. Like all estuaries, it depends upon the inflow of freshwater to maintain its salinity regime. Salinity variations, spatial and temporal, constitute the most significant physical parameter influencing the circulation dynamics of the estuary and the types of aquatic species which reside in it. The quantity of fresh water flowing into the Chesapeake may be substantially reduced in the future due to a marked increase in the consumptive use of water. The Corps of Engineers Low Freshwater Inflow Study was conceived as a result of the concern over this increased consumptive use. The objectives of this study are to assess the environmental, economic, and social consequences of these reduced flows and if appropriate, to formulate criteria for minimum freshwater inflows. A major portion of this work will be based on the results of a series of tests conducted on the Chesapeake Bay Model. A drought or depressed freshwater inflows can be simulated at any time on the model. It will be necessary to conduct a series of three tests on the hydraulic model: a problem identification test, a sensitivity test, and a plan formulation test. (Moore-SRC)

Descriptors: *Estuarine environment, *Low flow, *Environmental effects, *Salinity, Model studies, Computer models, Simulation, Consumptive use, Drought, Ecosystems, Habitats, Water circulation, *Chesapeake Bay, Freshwater inflow.

Modification of the Chesapeake Bay hydrologic environment has occurred over the past several decades, and is expected to continue at least until the end of the century. An attempt to assess the impact of low freshwater inflows (due to drought and consumptive losses) upon the Chesapeake Bay biota is currently underway. Some of the tools being used in this assessment are: distribution, tolerance, and life history studies of selected estuarine species; hydraulic modeling of salinity and circulation regimes; and computer simulation of representative segments of the ecosystem. Critical life history stages, habitat and food requirements, and tolerance to physical stress have been used to select representative study speces for evaluation of effects of reduced freshwater flows. Information on community structure and trophic relationships has been used to develop a conceptual model of major energy flows within the Chesapeake Bay ecosystem. A computer simulation model will be used to provide insight into the effects of low flow, and the propagation of these effects throughout the ecosystem. The results of this study will aid managers in planning consumptive use patterns of freshwater flows into the estuary. (Moore-SRC)

Descriptors: *Estuaries, *Environmental effects, *Bass, *Growth stages, Water resources development, Water quality, Hydrodynamics, Larval growth stages, River flow, Seasonal variation, Runoff, Climates, *Potomac River estuary.

In order to provide projected freshwater supplies for human activities in the Washington, D.C., metropolitan area a number of engineering devices have been proposed, including a number which have the potential to change hydraulic regimes in the Potomac River. A population dynamics study of striped bass was conducted in the Potomac Estuary from 1974-1977 to determine the effects of these changes. Investigations included measurement of hydrodynamic characteristics; water quality; phytoplankton; zooplankton; and striped bass egg, larval, juvenile, and adult stages. Larval and juvenile food habit data were also developed. Biological data indicated that striped bass year-class success, as measured by juvenile abundance, was not closely correlated to abundance of spawning stock, number of eggs deposited or early, nonfeeding larval stages. These results suggested that density-independent mechanisms controlled the eratic patterns of year-class success of the this species. Climatic data were compared to available juvenile abundance data for a 25-year period. Strong year-classes were correlated with colder than average winters (December) which were followed by above average spring (April) freshwater runoff to the estuary. High densities of zooplankton at the time of first larval feeding and the spatial distribution of the spawning stock contributed to larval survivorship and consequent establishment of year-class strength. Evidence suggests that any significant diminution of springtime freshwater discharge to the estuary would tend to decrease the probability of substantial recruitment success. (Moore-SRC)

Descriptors: *Sport fishing, *Flow dishcarge, *Fish behavior, *Estuarine fisheries, Flood control, Environmental effects, *St Lucie estuary, Martin County, Florida.

The St. Lucie River is a 6,000 acre estuary located on the east coast of Florida. It is the eastern outlet of fresh water released from Lake Okeechobee through the St. Lucie Canal. The primary purpose of the releases is for flood control. Neighboring communities depend heavily on tourism and are concerned about the effect that the freshwater discharges and associated silt loads have on fishing success. A creel census was conducted for one year. Multiple-source, stepwise regression analysis and ridge regression analyses were performed on the freshwater discharges and creel data to determine if catch rates are affected by the St. Lucie Canal discharges, and if so, in what part of the estuary they are affected. The catch rates of nine important fish species were found to be significantly influenced by the moderate freshwater discharges from the canal. The nine species were snook, croaker, sheepshead, mullet, black drum, weakfish, gafftopsail cafish, gray snapper, and Irish pompano. The discharges from the St. Lucie Canal over the survey period amounted to 440,000 acre-feet. During discharges, species habits are less predictable, and the augmented freshwater releases cause fish movements. Long-term analyses show an actual drop in angler usage of the estuary in the face of great increases in human populations. (Moore-SRC)

In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, September 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol I, October 1981, p 431-435. 10 Ref.

Descriptors: *Shrimp, *Estuarine fisheries, *Salinity, *Water management, River flow, Sediment transport, Nutrient, Commercial fisheries, Estuarine environment, Environmental effects, *Texas.

The economic impact of the shrimp industry to Texas was approximately one-half billion dollars in 1979. There are three species of shrimp which basically support the commercial shrimp fishery: the brown shrimp, the white shrimp, and the pink shrimp. The annual catches of these dominant species tend often to be highly variable, associated to a great degree with environmental conditions. Freshwater inflows and the resulting marsh area vitality are important to the shrimp, particularly during their critical estuarine-growth phase. During the estuarine growth phase, local fluctuations in temperature and salinity can drastically affect both the availability of marsh suitable for growth and the actual growth rate of the shrimp. Man-made alterations such as impoundments, bulkheading and alterations in freshwater discharges can accentuate the fluctuations causing considerably more detrimental impact. While ever-increasing requirements are being placed on the surface water resources, the need for balanced salinity regimes as well as sufficient nutrients and sediments to maintain a sound habitat should be paramount in the allocation process. Water management agencies, fishery resource protection agencies, and the fishing industry should maintain a close working relationship to insure vitality of the estuaries and the significant fisheries resource. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol I, October 1981, p 454-471. 9 Fig, 1 Tab, 18 Ref.

Descriptors: *Salinity, *Estuarine environment, *Zooplankton, *Rainfall, *Streamflow, Water use, Flushing, Nutrients, Foods, Predation, Copepods, *Texas, Bays, Freshwater inflow.

Increased municipal, agricultural, and industrial usage of fresh water prompted the need for research in determining requirements for freshwater inflow into Texas estuaries. Between October 1972 and May 1975, two periods of major freshwater inflow (June-November 1973 and August-September 1974) affected zooplankton populations in the Nueces-Corpus Christi and Copano-Aransas Bay Systems. Salinity fluctuations in the study area were negatively correlated with local rainfall. Stronger negative correlations were observed for salinity with streamflow. Major freshwater incursions physically flush out estuarine zooplankton populations and replace them with freshwater species. Increased salinities even as low as 1.0 ppt to 3.0 ppt result in a rapid return of estuarine species, especially the euryhaline copepod Acartia tonsa. It is speculated that the success of large populations of A. tonsa following peak inflows can probably be attributed to influx of nutrients, food, and a decrease in higher salinity predators. The higher overall salinities recorded during this study in the Nueces-Corpus Christi Bay system indicate that this area is affected by tidal incursions of higher salinity Gulf water more than the Copano-Aransas Area. FWS/OBS-81/04, Vol II, Oct. 1981, p 88-108. 6 Fig, 23 Ref.

Descriptors: *Salmon, *Environmental effects, *Estuaries, *River flow, *Anadromous fish, Survival, Fish migration, Diversion losses, Flow pattern, Dissolved oxygen, Water temperature, Water resources development, Freshwater inflow, *Sacramento-San Joaquin estuary, California.

Changes in freshwater influence the survival, abundance, migration and rearing of chinook salmon in the delta portion of the estuary. Low flows in the upper Sacramento and San Joaquin Rivers result in decreases in fry migration to the estuary, and juvenile abundance and survival in the delta. Both adult and juvenile migration are adversely affected by diversions from the San Joaquin River. Young salmon are caught on the screens while smaller fish pass through, and additional fish are lost at unscreened diversions. Adult fish are prevented from using some channels for migration because of the flow reversals caused by pumping. Low flows in the rivers result in higher water temperatures which discourage adult salmon migration. Low dissolved oxygen levels caused by high levels of organic materials in the rivers also discourage adult migration. These observations are based on seine and trawl surveys, collections at water diversion fish screens, and mark-recapture techniques. Many of the present and potential flow-related

problems are largely attributed to water development operations upstream and within the estuary. Management plans have been designed to correct some of these problems. (Brambley-SRC)

SOME EFFECTS OF FRESH WATER ON THE ATCHAFALAYA BAY SYSTEM,

University of Southwestern Louisiana, Lafayette. Dept. of Botany.
H. D. Hoese.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 110-124. 3 Fig, 6 Tab, 7 Ref.

Descriptors: *Atchafalaya Bay, Louisiana, *Ecosystems, *Aquatic animals, *Environmental effects, *River flow, *Estuaries, Salinity, Water temperature, Productivity, Floods, Flood control, Freshwater inflow.

Diversion of water from the Mississippi River to the Atchafalaya River has caused reduced salinity in Atchafalaya Bay, becoming practically freshwater under flood conditions. Salinity ranged from 0.1 - 0.9 ppt over the year, while in Vermilion Bay, furthest from the river mouth the range was 0.2 - 9.3 ppt. There were significant differences in water temperature between the two bays with temperatures up to 5C warmer in Vermilion Bay. Significant variations occurred in air and water temperature differences between the two bays. The fauna of Atchafalaya Bay was characterized by river shrimp, gars and catfish, while that of Vermilion Bay was characterized by white shrimp, anchovies and bull sharks. Productivity decreases are suggested to be a result of the decreased temperature caused by increased flows of cold river water, particularly during the winter and spring floods. This effect of flood flows should be considered when flood management systems are designed. (Brambly-SRC)

FRESHWATER INFLOW AND SALT WATER BARRIERS FOR MANAGEMENT OF COASTAL WILDLIFE AND PLANTS IN LOUISIANA,

Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
R. H. Chabreck.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in papercopy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 125-138. 3 Tab, 22 Ref.

Descriptors: *Coastal marshes, *Coastal zone management, *Saline water intrusion, *Saline water barriers, *Ecosystems, Channeling, Levees, Subsidence, Erosion, Salt marshes, Brackish water, Wetlands, Ducks, Muskrats, Alligators, Freshwater inflow, Louisiana.

The Louisiana coastal marsh is subdivided into four types: saline, brackish, intermediate, and fresh. They occur in bands generally paralleling the coastline and contain characteristic water salinity levels and plant and animal communities. The boundaries of the marsh types have changed as a result of human activities and natural events. The northern boundary of the salt marsh has moved inland an average of 3.4 km in the period 1943-1968, largely as a response to leveeing, canal dredging and stream channelization, and subsidence and erosion. The various characteristics of each marsh and its plant life provide for habitats for different animal species which use one or more preferentially. The saline marsh supports fewest plant species, and the fresh marsh the most. Dabbling ducks favor the intermediate and fresh marshes, muskrats prefer the saline and brackish marshes, and alligators prefer the brackish and intermediate marshes. Nutria populations tend to decrease as salinity increases. The tendency to increased salt marsh results in decreases in wildlife. Two methods are available to prevent the advance of salt-water: artificial barriers, and freshwater introduction into the headquarters of the drainage basin. Both methods have application in Louisiana, and a recommended goal is to restore the marshes to their conditions in 1943. (Brambley-SRC)

REVIEW OF ESTUARINE-RELATED PROJECTS BY THE GULF OF MEXICO FISHERY MANAGEMENT COUNCIL,

Gulf of Mexico Fishery Management Council, Tampa, FL.
V. J. Blomo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 147-154. 6 Ref. 2 Append.

Descriptors: *Estuarine environment, *Federal jurisdiction, *Gulf of Mexico, *Fisheries, *Fish management, *Shellfish, Estuaries, River flow, Channelization, Dredging, Spoil disposal, Wetlands, Land development, Planning, Permits.

The enactment of the Fishery Conservation and Management Act of 1976 provided for the stewardship, by regional fishery management councils, of the fishery resources beyond state jurisdiction to 200 miles. The councils develop management plans for fish and shellfish which consider fishery resources in their entire range of habitat. In the Gulf of Mexico, most of the fishery resources are estuarine-dependent, and the Gulf Council therefore has taken a keen interest in alterations to this habitat. Council input to projects affecting freshwater inflow to estuaries is proper because of its responsibility and effective because of the diverse interests represented on the council. Input made to date relates to diversion of freshwater; channelization, dredging and spoils disposal; residential development; and private use of a wetland area affecting public resources. In the one case which has been decided a permit for the development was denied. (Brambley-SRC)

VALUES OF ECOLOGICAL CHARACTERIZATION STUDIES TO ASSESS EFFECTS OF FRESHWATER INFLOW TO ESTUARIES,

Fish and Wildlife Service, Slidell, LA.
J. B. Johnston, N. G. Benson, and B. D. King, III.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 155-164. 2 Fig, 10 Ref.

Descriptors: *Ecosystems, *Coasts, *Estuaries, *Planning, *Coastal zone management, Environmental effects, River flow, Channelization, Reservoirs, Marshes, Chenier Plain, Mississippi Deltaic Plain, Wetlands, Erosion, Ecological effects, Freshwater inflow.

Ecological characterization studies compile existing information (utilizing a holistic approach) that identifies functional relationships among natural processes and components of coastal ecosystems. Some studies have mapped habitat changes from aerial photographs over a 20- to 25-year time period. The studies integrate environmental and socioeconomic information in a form useful for planning, impact assessment and analysis. Studies completed or underway include the Chenier Plain of Southwestern Louisiana and Southeastern Texas, Sea Islands Region of South Carolina and Georgia, Pacific Northwest, Northern and Central California, Mississippi Deltaic Plain, Texas Barrier Islands Region, Rocky Coast of Maine, Northeastern Gulf of Mexico, and Southwestern Florida. Data from the Sabine basin of the Chenier Plain study demonstrated the quantified effects of modifying natural river flow on Sabine Lake and the associated estuarine area. Navigation channel developments, construction of reservoirs on the incoming rivers, and impoundment of marshes were the primary causes of ecological changes. The Mississippi Deltaic Plain study mapped habitat changes from the mid-1950's to 1978. Many of the habitat changes resulted from the modification of freshwater inflow. The study indicated that over 500,000 acres (202,000 ha) of Louisiana coastal wetlands were lost or altered during the period. The information developed from the ecological characterizations will enable planners to understand and predict the consequences of future alterations in the coastal zone.

EFFECTS OF ALTERATIONS OF FRESHWATER INFLOWS INTO MATAGORDA BAY, TEXAS,

Texas Univ. at Austin. Dept. of Civil Engineering.
N. E. Armstrong, and G. H. Ward, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX, Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Rept. FWS/OBS-81/04, Vol II, Oct. 1981, p 179-196. 3 Fig, 2 Tab, 11 Ref.

Descriptors: *Matagorda Bay, *Texas, *Environmental effects, *Water resources development, *Seawater, *Diversion channels, Estuarine environment, Water demand, Salinity, Model studies, Nutrients, Habitats, Navigation, Sedimentation, Water circulation, Freshwater inflow.

The Matagorda Bay, Texas, region is experiencing increased development on its periphery and in its drainage basin. The Matagorda Bay Project is a three-year study focusing primarily on the effects of altered freshwater inflows on the living resources of the bay. Freshwater inflows will be reduced because of increased withdrawls of water from the Colorado, Lavaca, and Navidad Rivers for agricultural, industrial, and municipal purposes. The reduced inflows will cause an increase in salinity, but model studies show that this will be less than 1 ppt. Nutrient concentrations may be increased or reduced depending on upstream practices. The biological effects are expected to be the result of loss of nursery areas in secondary and tertiary bays, and the possible loss of nutrients. A navigation and diversion project is planned for the Colorado River, in which water from the river will be diverted into Matagorda Bay, and a navigation channel will be maintained to the Gulf of Mexico. The major effect of the diversion channel will be to alter the circulation in Matagorda Bay and increase sedimentation. The increased sedimentation will eliminate some shallow bay habitat, but at the same time, build up new marsh habitat. These results are preliminary; biological and hydrological studies are continuing. (Brambley-SRC)

Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 289-304. 5 Fig, 31 Ref.

Descriptors: *Rivers, *Ecosystems, *Environmental effects, Headwaters, Estuaries, Stream profiles, Particulates, Suspended solids, Habitats, Light quality.

The river continuum concept suggests that a natural river system, from headwaters to estuary, can be considered a gradient of process zones ranging from a strongly detrital based system in headwater streams to a seasonal, or perhaps annual, autotrophic regime in moderate-sized streams and then, a gradual return to predominately heterotropic processes in large river systems. The structural and functional properties of stream communities tend to be selected to conform to the dynamic pattens of physical energy expenditure and the most probable physical state as proposed by fluvial geomophologists. Each stream reach along the continuum has local inputs in the form of light energy and particulate material from the terrestrial landscape and the partially processed materials transported from upstream reaches. Particle size of organic material in transport becomes progressively smaller as it passes down the continuum and biotic communities structured on the transport system become progressively more efficient in processing smaller particles towards downstream areas. Consumer communites in rivers are considered to be structured by local inputs, autochthonous and allochthous; materials in the transport system; and gradients in fluvial geomorphic processes throughout the drainage network. The concept may be used to predict changes resulting from upstream perturbations such as channelization, impoundments, logging, and waste inputs and in the management of rivers. (Brambley-SRC)

CHARACTERIZATION OF FRESHWATER INFLOW MODIFICATION TO ESTUARIES RESULTING FROM RIVER BASIN DEVELOPMENT,

Geological Survey, NSTL Station, MS. Gulf Coast Hydroscience Center.
M. E. Jennings.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 375-384. 6 Fig, 9 Ref.

Descriptors: *River flow, *Estuaries, *Model studies, *Water resources development, Statistical analysis, Climatology, Simulation, Hydroelectric power, Reservoir operation, Freshwater inflow, *Ecological effects.

There are three approaches for determining quantity and modification of freshwater inflow to estuaries: continental-scale assessment, statistical studies of long-term records at the mouth of a river, and river basin modeling. Continental-scale assessments are of limited use in determining modifications of freshwater flows. The statistical approach is illustrated using long-term streamflow records for the Brazos River, Texas, and the Santee River, South Carolina. For both rivers, the influence of upstream impoundments is obvious, and for the Brazos River, the 9-year moving averages show the dominance of the long-term regional climatic effect on the flow pattern. River basin modeling, illustrated using data from the lower Santee River Basin, is believed to be the best approach for general field studies. The Large River Basin Transport Model is being developed, which will make long-term (20-50yr) simulations. The model was used with the Santee River data to optimize power production through a study of reservoir operating rules. The observed and computed flows were in good agreement for flow in the river and discharges used in power production. (Brambley-SRC)

EFFECTS OF LAKE MICHIGAN DIVERSION ON THE WATER CHEMISTRY OF THE ILLINOIS WATERWAY,

Illinois State Water Survey, Peoria. Water Quality Section.
V. Kothandaraman, and R. L. Evans.
Water Resources Bulletin, Vol 17, No 4, p 607-613, August, 1981. 3 Fig, 6 Tab, 4 Ref.

Descriptors: *Diversion, *Illinois waterway, *Environmental effects, Mathematical models, Mathematical studies, *Water quality, Chemical composition, *Lake Michigan.

Baseline water chemistry data were developed for the Illinois Waterway to assess the probable extent and magnitude of the impact of diverted Lake Michigan waters on the water chemistry of the Illinois Waterway. Two hundred and seventy miles of the Illinois Waterway were monitored at 10 mile intervals, and a statistical method was used to define the interstation relationships for the chemical parameters. Mathematical models were used to predict the effects of the Lake Michigan diversion. Two diversion schemes, increased diversions of 3400 cfs or 6800 cfs under three different flow conditions, were examined. The diversion of Lake Michigan water was predicted to improve the chemical quality of the waterway. The mineral content of the mixed flow resulting from increased diversion under average, wet, and dry flow conditions would not affect the osmotic balance of the waterway's fauna and flora. USER REACTION TO WILD AND SCENIC RIVER DESIGNATION,

Clemson Univ., SC. Coll. of Forest and Recreation Resources.
R. H. Becker.
Water Resources Bulletin, Vol 17, No 4, p 623-626, August, 1981. 4 Tab, 10 Ref.

Descriptors: *Recreation demand, *Wild rivers, *Environmental protection, Recreation, Wilderness areas, Legal aspects.

Problems have arisen when new users are attracted to rivers which have been designated as wild and scenic, as the recreational behavior of the new users may be unacceptable. The designation as wild and scenic under the National Wild and Scenic Rivers Act of 1968 may actually attract more users and negatively affect the area the designation was designed to protect. Studies of use patterns on the northwest Wisconsin River and the Lower St. Croix/Mississippi indicated that increased use was associated with publicity and exposure to the general public. The national program reduces structural development, but there is a loss of low density recreational opportunities on the rivers. Legislation designating a specific river to the Wild and Scenic River System should include actions to preserve the social quality and recreational experiences that make the river special. ENVIRONMENTAL REPERCUSSIONS OF IRRIGATION DEVELOPMENT IN HOT CLIMATES,

Ahmadu-Bello Univ., Zaria (Nigeria). Dept. of Environmental Health.
B. Z. Diamant.
Environmental Conservation, Vol 7, No 1, p 53-58, Spring, 1980. 2 Fig, 14 Ref.

Descriptors: *Irrigation programs, *Environmental effects, *Developing countries, Irrigation effects, Water resources development, Public health, Sprinkler irrigation, Diseases, *Human diseases, Social aspects, Economic aspects, Reservoirs, Vegetation effects, Water level fluctuation, Legislation.

Irrigation projects intended to improve food supplies and the quality of life in third world countries have caused severe problems: spread of waterborne diseases and social upheavals among the peoples resettled by flooding impoundments. Malaria and/or schistosomiasis have appeared or increased in the areas near Lake Akosombo, Ghana; Lake Nasser, Egypt; the Indus River Basin, Pakistan; and Helmand River project, Afghanistan. Environmental health aspects should be included in the planning, construction, and operation of large-scale irrigation projects. Vector control measures, which break the three-part cycle (sick carrier, transmitting vector, and recipient), can be accomplished by proper engineering to produce a habitat unfit for snails and mosquitos. Chemical, biological, and genetic control are not as effective or are still in the research stage. Some suggestions for destroying habitats for disease vectors are: controlling vegetation, straightening banks, producing frequent changes in water levels, reducing evaporation, eliminating wastewater influx, installing snail screens, using closed channels, sprinkling irrigation water, and choosing crops which do not need flooding. The complicated social and economic changes produced by these projects require a prior sociological survey. The population should be consulted before the fact on allocation of new farming plots, methods of cultivation, types of crops, and housing. Operation and maintenance of the water projects should be regularly surveyed by teams of ecologists, environmental engineers, entomologists, and health workers. (Cassar-FRC)

AN INDUSTRIAL VIEW. TREATMENT VIS-A-VIS DISCHARGE TO SEWERS,

Confederation of British Industry, London (England).
A. I. Biggs.
Water Science and Technology, Vol 13, No 7, p 331-335, 1981.

Descriptors: *Policy making, *Future planning, *Industrial development, *Ecological effects, Water resources development, Water use, Nonconsumptive use, Administrative decisions, Water quality management, Economic effects, Environmental effects, *United Kingdom.

The effect of industry and commerce on the environment is considered, with special focus on the use and protection of water resources and the economic aspects thereof. In the United Kingdom, commerce and industry account for most of the major discharges of used water into the rivers and estuaries. The Confederation of British Industry (CBI) has issued a policy statement asking governments to consider the benefits of industrial development when planning laws concerning the protection or use of natural waters. CBI has also urged industry to consult with government policymakers when planning for increased development. CBI maintains that well managed industrial and commercial growth should be compatible with careful use of environmental resources. (Geiger-FRC)

SOME ENVIRONMENTAL IMPACTS OF A STORM SURGE BARRIER,

Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam.
J. H. B. W. Elgershuizen.
Marine Pollution Bulletin, vol 12, No 8, p 265-271, August, 1981. 5 Fig, 1 Tab, 17 Ref.

Descriptors: *Flood control, *Barriers, *Environmental effects, Netherlands, *Holland, Storm surges, Estuaries, Scheldt Estuary, Salt marshes, Ecosystems, *Baseline studies.

In 1985 the newly designed storm surge barrier (SSB) will be constructed across the mouth of the eastern Scheldt in the Netherlands to seal off most of the large inlets in the southwestern part of the land. The project was launched in answer to drastic flood losses in 1953. A complete closure of most of the inlets and also the Eastern Scheldt was envisaged, except for the New Waterway and the Western Scheldt, which are important to shipping. The original study had called for the construction of a dam, but this was changed in 1976 to the construction of a storm surge barrier to close the Eastern Scheldt estuary, and thus buy safety for the polders and preserve the ecological system of the Eastern Scheldt. The SSB will cause the for-

mation of a new, unnatural ecosystem. To make the appropriate decisions to manage this area in as natural a way as possible, a sound knowledge of the Eastern Scheldt ecology is urgently needed. From the evaluation studies this far conducted it appears that one closure per year for 12 hr would not have any significant effect, but if closure times are long or if frequent complete closures occur, problems may arise. Thus it is suggested that, in place of complete closures, partly closing the barrier may avoid a concentrated attack of flood waters on sand and mud flats, dikes and salt marshes. This may result in the maintenance of a reduced tide in the Eastern Scheldt, and appears to offer a good compromise between safety and ecology. (Baker-FRC)

RECENT TRENDS IN ENVIRONMENTAL IMPACT ASSESSMENT,

Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
D. M. Rosenberg, V. H. Resh, S. S. Balling, M. A. Barnby, and J. N. Collins.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, No 5, p 591-624, 1981. 5 Fig, 8 Tab, 225 Ref. (California Water Resources Center Project UCAL-WRC-W-519). OWRT-A-063-CAL(2).

Descriptors: *Environmental impact statement, *Assessments, *Aquatic environment, *Ecosystems, Powerplants, Fossil fuels, Recreation, Reservoirs, Wastewater treatment, Forestry, Dredging, Estuaries.

The overall objective of this paper is to examine the use that research based on the scientific method can have in assessing environmental impacts. Emphasis has been placed on environmental impacts that involve aquatic ecosystems. The specific objectives are to characterize an 'ideal' environmental impact assessment for several major types of developments, mainly in North America; and to identify successes, failures, and future needs in environmental impact assessment (e.i.a.). Environmental impact assessment has had the following successes; increased environmental awareness due to public involvement in e.i.a., some environmental protection, and elucidation of intruguing research problems. The list of failures of e.i.a. is, however longer: 'tokenism,' unrealistic time constraints, uncertainty of program or development schedules, difficult access to e.i.a. literature, questionable ethics, lack of coordination among studies, and poor research design.

RELATIONSHIP BETWEEN WATER QUALITY AND THE COMMUNITY STRUCTURE OF EPIPHYTIC DIATOMS IN A MISSISSIPPI BAYOU,

Mississippi State Univ., Mississippi State. Dept. of Biological Sciences.
M. J. Sullivan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-157843, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute, Mississippi State University, Report, September, 1981. 27 p, 11 Tab, 14 Ref. OWRT-A-133-MISS(2). 14-34-0001-1126.

Descriptors: *Diatoms, Rooted aquatic plants, Sessile algae, Nitrogen compounds, Phosphorus compounds, *Water quality, *Bayous, Biological communities, Aquatic habitats, Marine algae, Rhodophyta, Chlorophyta, Cyanophyta, Submerged plants, Pondweeds, Salt marshes, *Mississippi, *Algae, Salinity, Comparison studies, Heavy rainfall effects, *Epiphytic algae, Grand Plains Bayou, Cocconeis, Bacillaria, Bostrychia.

Epiphytic diatoms were collected from the leaves of submerged angiosperms belonging to the genera Potamogeton, Zannichellia, and Najas in Grand Plains Bayou, Hancock County, Mississippi from March through September 1980. Extremely heavy rainfall caused this bayou to be an essentially freshwater system for the first five months of the study. Salinity finally rose to 6 o/oo in August and to 13 o/oo in September. The bayou waters were acidic to neutral for most of the study and concentrations of dissolved nitrogen and phosphorus were low, indicating that the system was relatively unproductive. Only seven species of red, blue-green, and green algae were collected and the epiphytic diatom flora was represented by a total of 50 taxa. The dominant diatom was Cocconeis placentula var. euglypta (Ehr.) Grun. which accounted for 84.1% of all valves counted. During the freshwater period species diversity (H') and the number of taxa in a sample (S) were very low, rarely exceeding 0.82 bits/individual and 10 taxa. After saltwater intrusion H' increased beyond 2.0 and S exceeded 20. Multiple regression involving H', S, or the relative abundances of seven taxa as the dependent variable and selected water quality measures as the independent variables demonstrated a significantly statistical relationship between Cocconeis fluviatilis Wallace and Bacillaria paradoxa Gmelin and water quality in Grand Plains Bayou. The abundance of the former could be predicted by knowledge of the concentrations of ammonia nitrogen, orthophosphate, and total dissolved phosphorus, while that of the latter could be predicted by salinity alone.

INTERACTIONS POTENTIALLY AFFECTING THE SEASONAL ABUNDANCE OF SELECTED AQUATIC INVERTEBRATES IN A RICE FIELD HABITAT,

Minnesota Univ., St. Paul.
F. G. Zalom.
Hydrobiologia, Vol 80, No 3, p 251-255, 1981. 3 Fig, 12 Ref.

Descriptors: *Population dynamics, *Invertebrates, *Predation, Rice, Seasonal variation, Water temperature, Vegetation effects, Midges, Crustaceans, Copepods, Species diversity, Corixidae, Belostomatidae, Dystiscidae, Hydrophilidae, Notonectidae, Aquatic animals, Paddies, Wetlands, California, *Rice farming.

The seasonal abundance of aquatic invertebrates in California rice fields depended on water temperature and plant stand. Predator-prey interactions further modified the observed seasonal patterns. Sampling was conducted weekly, May to August 1977 and 1978. Data was subjected to multiple regression analysis. Prey organisms were Chironomidae larvae, Corixidae, and Crustacea; predators were Belostomatidae, Dystiscidae adults, Hydrophilidae larvae, and Notonectidae. Prey populations peaked in mid to late June and to a lesser degree in late July. Predator populations displayed more variable peaks. Average water temperatures increased during the first 5 weeks after initial flooding of the rice paddies and decreased slightly as the plant stand grew denser in July. (Cassar-FRC)

MONITORING FRESHWATER INFLOW TO ESTUARIES BY REMOTE SENSING,

National Aeronautics and Space Administration, Hampton, VA. Langley Research Center.
R. W. Johnson, and B. M. Kendall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 17-40. 10 Fig, 3 Tab, 19 Ref.

Descriptors: *Remote sensing, *Satellite technology, *Estuaries, *River flow, Tidal rivers, Plumes, Temperature, Salinity, Suspended solids, Chlorophyll, Spatial distribution, Temporal distribution, Aerial photography, *Freshwater inflow.

Experiments conducted in the United States coastal zone indicate that features such as plumes from freshwater inflow have distinctive spectral characteristics. These spectral characteristics have been correlated with concentrations and/or distributions of temperature, salinity, suspended solids, and chlorophyll a in plumes and surrounding estuarine water. Remotely sensed wide area synoptic coverage of surface estuarine features provides a perspective on spatial and temporal distributions that is not readily available by shipboard measurements. Data outputs from remote sensors, to date, include high resolution measurements to determine concentrations and distributions of total suspended particulates, temperature, salinity, and chlorophyll a from airborne and/or satellite platforms; and low resolution measurements of total suspended solids, temperature, and possibly chlorophyll from satellite platforms. Archived data (such as from Landsat) may be used for historical studies of river plumes and other estuarine features. Examples are presented in which remotely sensed optical and microwave spectral range data, with and without concurrent surface measurements, are used to study spatial and temporal characteristics of plumes. In general, qualitative assessments may be made without concurrent surface measurements based on differences of water color, temperature, and salinity within the plume or between the plume and the receiving water. Quantitative distribution of suspended solids, temperature, salinity, and chlorophyll a require concurrent surface measurements to calibrate the remotely sensed data.

A DYNAMIC METHODOLOGY FOR CHARACTERIZING AND MONITORING ESTUARINE ECOSYSTEMS,

Gulf Universities Research Consortium, Houston, TX.
T. L. Linton, and S. G. Appan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-131434, Price codes: A23 in paper copy, A01 in microfiche. In: Proc. of the National Symposium on Freshwater Inflow to Estuaries, San Antonio, TX., Sep. 9-11, 1980. Fish and Wildlife Service, Office of Biological Services Report FWS/OBS-81/04, Vol II, Oct. 1981, p 448-462. 5 Fig, 12 Ref.

Descriptors: *Estuarine environment, *Estuaries, *Data acquisition, *Variability, *Prediction, Environmental effects, Monitoring, Water temperature, Salinity, Polychaetes, Species diversity, Substrates, Ecosystems.

A methodology is proposed that utilizes extant data from disparate sources for the purpose of determining or predicting transitory and/or permanent effects that natural and/or man-made changes will cause in an estuarine ecosystem. Data on estuaries in Alabama, Louisiana and Texas were used to construct a computer file, from which the natural variability of the estuary may be defined. Temperature and salinity changes were recorded for one year, and substrate type and polychaete species were determined for the following estuaries: Timbalier, Lavaca, Aransas, Copano, and Mobile. The Lavaca estuary characteristics were used to select monitoring stations, and the principal months for seasonal monitoring. The spatial, temporal, and species-level variability for polychaetes, and seasonal variability of temperature and salinity were determined. Data from the monitoring program that fall within these ranges would indicate that activities are not derimental to the estuary. This method provides a direct way to measure actual impacts, can be updated as more data becomes available, provides for prediction of impacts in similar estuaries, can aid in the design of monitoring programs, and detect the cumulative effects of many activities. THE WARMWATER SPORT FISHERY OF EASTERN LAKE ONTARIO,

New York State Dept. of Environmental Conservation, Watertown.
F. M. Panek.
New York Fish and Game Journal, Vol 28, No 2, p 178-190, July, 1981. 4 Fig, 5 Tab, 11 Ref.

Descriptors: *Sport fishing, *Lakes, *Lake Ontario, Fish harvest, Surveys, Fish populations, Surveys, New York.

Findings of a creel census in New York waters of the eastern basin are reported. The study area comprised the waters of Lake Ontario from Stony Point to Tibbets Point. The census consisted of counting the number of anglers and interviewing some of them for specific information. It was conducted on 78 days between June 17 and October 27, 1978. Within the study area, 16 sampling stations were selected on the basis of their suitability for obtaining reliable counts of shore anglers and boat anglers. A total of 1,676 counts of shore anglers and boats were recorded, and 372 anglers were interviewed. Fishing pressure was estimated as 274,073 angler hours, with 91% of it being associated with boat fishery and 55% with the time spent on weekends and holidays. The estimated total fish harvest of 394,529 fish included 13 species, of which small mouth bass, yellow perch and rock bass comprised 98%. Catch rates for legal sized smallmouth bass averaged 0.47 fish per hour in the boat fishers. Catch rates were similar to those of earlier studies, indicating that the bass fishery in the eastern basin is both stable and of high quality. (Baker-FRC)

REAL-TIME RAINFALL MONITORING-PREDICTION SYSTEM AND URBAN HYDROLOGIC OPERATIONS,

F. A. Huff, J. L. Vogel, and S. A. Changnon, Jr.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 419-435, October, 1981. 2 Fig, 10 Tab, 14 Ref.

Descriptors: *Urban hydrology, *Weather forecasting, *Storm water, *Chicago, Illinois, Meteorological data collection, Forecasting, Storm sewers, Rainfall distribution, Rain gages, Radar, Rainfall-runoff relationships, Remote sensing, Combined sewers, Monitoring, Water management.

A 4-year (1975-79) comprehensive hydrometeorological research program carried out in the Chicago metropolitan area was designed to expand the use of meteorological information in the real-time operation of urban hydrological systems to protect people, property, and the environment during moderate to heavy rains. A real-time monitoring-prediction rainfall system was developed. This monitors rainfall from storms crossing the urban area and predicts the rainfall distribution for the upcoming 30, 60, and 120 min. The system employs weather radar and a computer output when necessary. This man-machine combination produced more accurate rain monitoring data (accurate within 0.1 inch 76% of the time) than both unadjusted radar rainfall measurements (48%) and a dense network of recording rain gages (73%). With real-time rainfall data input from the Metropolitan Sanitary District network, predictions by the man-machine combination were accurate to within 0.1 inch 82% of the time. These improvements were most noticeable in heavier rainfall. (Cassar-FRC)

7B. Data Acquisition

AN INITIAL APPLICATION OF POLARIZATION LIDAR FOR OROGRAPHIC CLOUD SEEDING OPERATIONS,

Utah Univ., Salt Lake City. Dept. of Meteorology.
K. Sassen.
Journal of Applied Meteorology, Vol 19, No 3, p 298-304, March, 1980. 5 Fig, 1 Tab, 5 Ref.

Descriptors: *Cloud seeding, *Remote sensing, Weather modification, Artificial precipitation, Lidar, Radar, Wasatch Mountains, *Utah.

Preliminary field application was made of polarization lidar in conjunction with commercial cloud seeding operations in the Wasatch Mountains of northern Utah. The lidar system transmits a vertically polarized lasar pulse and measures the returned energy in the planes of polarization both orthogonal and parallel to that of the source. Linear depolarization ratios are derived from the two-channel lidar data displays to characterize the change in the polarization state of the backscattered energy and provide an indication of cloud composition. The use of polarization lidar proved helpful in this study. Background observations of unseeded cloud layers could be obtained through the method to provide better knowledge of local orographic precipitation formation and to determine a measure of cloud ice water balance to aid in the establishment of generalized seeding criteria specific to a mountain barrier. The observed local dependence of cloud ice water balance on cloud top temperature shows support for the less than minus 30 degrees C cloud-top temperature seeding window. The ability to monitor cloud ice water balance can be applied to the real-time seed/no-seed decision. The combined use of radar and lidar data can remove some of the ambiguity in the interpretation of rawinsonde data for the derivation of seeding criteria. Direct observations of the modifications produced by seeding operations can be employed as part of a physical evaluation method to predict snowfall augmentation and targeting. Thus it was concluded that, despite the range limitations of lidar, the application of the remote sensing techniques can make important contributions to orographic cloud seeding operations and research. SOME MEASUREMENTS ON NEAR SURFACE TURBULENCE IN THE DEPTH DIRECTION AND SOME PHYTOPLANKTON DISTRIBUTION IMPLICATIONS,

Gore and Storrie Ltd., Toronto (Ontario).
M. D. Palmer.
Journal of Great Lakes Research, Vol 7, p 171-181, 1981. 11 Fig, 4 Tab, 26 Ref.

Descriptors: *Turbulent flow, *Phytoplankton, Aquatic plants, Plankton, *Harbors, Surface flow, *Hamilton Harbor, *Toronto Harbor, Diatoms, Surface water, Comparison studies.

Microphysical turbulence measurements taken near the water surface in Hamilton and Toronto harbors are presented along with some concurrent phytoplankton community structure data. The physical turbulence characteristics of the two harbors are compared. Also presented are some measurements of the depth turbulence at 0.5 and 3.0 meters below the water surface for a well stratified, partially stratified, and well-mixed water column in Hamilton Harbor. Concurrent with hot film measurements, horizontal velocity depth profiles were also measured periodically with drogues. Prevailing wind conditions, light attenuation, temperature, and biomass vs. depth were also measured. The light attenuation curves were used to provide data on the photic zone depth. The turbulence structure of the two harbors was different. The depth length scales were estimated to be 3.7 - 5.7 cm and 10.8 - 20 cm in the stratified and well-mixed cases, respectively. Depth dispersion coefficients were estimated to be 4.8 to 8.6 square centimeters per second and 22.7 to 44 square centimeters per second in the stratified and well mixed cases, respectively. In the well mixed case, depth phytoplankton patchiness did not occur. The mean depth patch size for green algae and Cryptomonads showed some relationship with turbulence integral scales and the most predominant periodicities. Greens were a larger portion of the biomass when the length and time scales were small, while diatoms were more prevalent with larger length and time scales. (Baker-FRC)

COMPOSITE SAMPLING OF HIGHWAY RUNOFF,

Brown and Caldwell, Seattle, WA.
D. L. Clark, R. Asplund, J. Ferguson, and B. W. Mar.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1067-1081, October, 1981. 10 Fig, 4 Tab, 12 Ref.

Descriptors: *Flow measurement, *Highways, Pollutant identification, Composite samples, Runoff, Storm water, Storm runoff, Field tests, Flow rates, Rainfall-runoff relationships, Water measurement, Sampling techniques.

A composite sampler has been developed to collect characteristic samples of storm water runoff from highways. It consists of a rectangular cross section open channel with a flow splitter placed parallel to the direction of flow. The device samples in proportion to the flow rate. The approach to the flow splitting dividers is at a supercritical slope, so that turbulent flow is maintained. This allows suspended solids to be sampled and prevents debris from clogging the flow splitter. The dimensions and materials of construction can be varied to fit the situation. In sampling a 1.22 acre area of Highway I-5 near Seattle, Washington, the equipment was designed to collect 1% of the total flow (about 50 cu ft for 1 incy of rainfall) with a 25 inch wide channel and an initial divider opening of 1 inch to collect 1/25 of the flow. Two additional flow splitting dividers produced the desired 1%. The composite sampling method has several advantages over the discrete sampling method. In addition to lower capital and operating costs and greater accuracy, it requires little attnetion and can be used at remote stations. It is checked only after a storm, when the depth of water is measured, a single sample collected, and a new plastic liner inserted. (Cassar-FRC)

AERIAL PHOTOGRAPHY TO DETECT RILL EROSION,

Washington State Univ., Pullman. Dept. of Agronomy and Soils.
B. E. Frazier, and D. K. McCool.
Transactions of the ASAE, Vol 24, No 5, p 1168-1171, 1176, September-October, 1981. 4 Fig, 5 Tab, 18 Ref.

Descriptors: *Erosion, *Remote sensing, Aerial photography, Photography, Infrared imagery, Farming, Rills, Rainfall, *Rill erosion, Palouse region, *Pacific Northwest.

The potential of low-level, large-scale aerial photography coupled with selective ground sampling to identify erosion in the Palouse region of the Pacific Northwest was investigated. A determination was also made as to which film (color or color-infrared) and viewing instruments were most

useful. The Palouse region includes large areas of silty loessial soils on roughly parallel hills with north and east facing slopes of 30 to 45% and south and west facing slopes of 0 to 30%. The climate is characterized by humid winters and dry summers. Most of the precipitation is received as low intensity rain or snow during the winter, when the soil is generally unprotected. Most water-caused erosion occurs between November and April. Implement patterns from chisel plowing, harrowing, double-disk drilling, and combining can be seen in the photographs with the naked eye. Furrow-spacing can be used as an indicator of surface roughness. Rills were the most common erosional features recognizable. These were documentable to various degrees, depending on the instrument used and the scale of photography. The contrast between dry soil and rill shadows was sufficient for easy detection of rills. There was little perceptible contrast in wet areas, making rills there hard to identify. Slope length and steepness can be measured with stereoscopic instruments, and crop management systems as well as some conservation practices may be identified. (Baker-FRC)

CONTINUOUS MONITORING AT MINWORTH WATER RECLAMATION WORKS,
Severn-Trent Water Authority (England).
X. M. V. Snaddon, J. Dee, F. Lax, M. Augustine, and H. Smith.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 1, p 77-92, January, 1980. 7 Fig.

Descriptors: *Monitoring, *Reclaimed water, *Sludge, *Water treatment, *Sewage effluent, *Biodegradation, Activated sludge, Construction materials, Electronic equipment, Biochemical oxygen demand, Organic carbon, Filtration, Water sampling, Calibration, Technology.

Minworth is a large water reclamation works which was used as a test site in an evaluation of the worth of continuous effluent monitoring. Long-term reliability of the monitoring system is limited by the finite life of both the pH and ammonia probes. Information to date indicates that the probes work satisfactorily for at least one month. The life of each probe is determined by the quality of effluent being examined. The system can run satisfactorily for a minimum of a week at a time. It has been in operation for over one year. Data obtained is conveyed to the central control room by a private wire telemetry system. The overall costs and benefits of this test project have not yet been calculated. (Titus-FRC)

A MORE VERSATILE SOIL WATER SAMPLER,
North Central Forest Experiment Station, Grand Rapids, MN.
M. D. Knighton, and D. E. Streblow.
Soil Science Society of America Journal, Vol 45, No 1, p 158-159, January-February, 1981. 1 Fig, 3 Ref.

Descriptors: *Soil water, *Instrumentation, *Sampling, Nutrients, Water quality, Leaching, *Ceramic cup, *Porous cup, Soil solution, Nutrient cycling, Nutrient budget.

The design and fabrication of a new versatile ceramic-cup soil water sampler are described. The new sampler may be installed prior to disruptive plot treatments that would destroy earlier models. The new sampler prevents the reverse flow of collected soil water that otherwise occurs if the soil dries during the sampling interval. In addition, the ceramic cup may be positioned very near the soil surface without the problems of instability that occur with earlier models.

STREAM SYSTEM EVALUATION WITH EMPHASIS ON SPAWNING HABITAT FOR SALMONIDS,
Corvallis Environmental Research Lab., OR.
M. A. Shirazi, and W. K. Seim.
Water Resources Research, Vol 17, No 3, p 592-594, June, 1981. 3 Fig, 2 Tab, 10 Ref.

Descriptors: *Spawning, *Fish eggs, *Streambeds, Aquatic habitats, Gravel, Salmon, Trout, Sediments, Ecological effects, Sediment grading, Land use.

A procedure for evaluating sedimentation impact on streambed gravel used for spawning by salmonids is presented. A visual estimation of the gravel composition, considering the requirements of the particular species, helps reduce the number of samples needed. A graph relates the mean diameter of the substrate to the estimated embryo survival. As an illustration, two Orgon creeks were studied: 2 km of Canal Creek (impacted by logging) and 1 km of Rock Creek (in an undisturbed area). The visual survey took two hours per km. Two persons worked an additional four hours each in sampling and field analysis of gravel at each site. Results indicated that 50% of Canal Creek and 20% of Rock Creek were suitable for spawning. Total spawning areas that would support greater than 80% survival are 860 sq m per km for Rock Creek and 160 sq m per km for Canal Creek. (Cassar-FRC)

Hydrobiologia, Vol 78, No 3, p 273-282, 1981. 4 Fig, 5 Tab, 28 Ref.

Descriptors: *Water currents, *Diatoms, *Distribution patterns, Streams, Algae, Lennoxville, Quebec, Periphyton, Substrates.

Glass slides oriented parallel and perpendicular to the current in a small stream near Lennoxville, Quebec, were submerged for 2-6 weeks to observed diatom growth patterns. Cocconeis placentula, Achnanthes linearis, and A. minutissima were the most abundant of the 98 species identified on the slides. Early colonization took place on the upstream and/or downstream edges of slides placed parallel to the current, followed by growth on the face of the slides. The slides placed perpendicular to the current showed even, random growth of algae. Slides at rocky sites contained more cells at the top edge than slides at muddy sites. The diatoms' preference for upstream and downstream edges on parallel slides is ascribed to current, which probably induces a higher invasion rate and higher reproduction rate. Diagrams illustrate how the slide edges are exposed to microturbulent flow and the increased possibility of algae collision with such a surface compared with the slide surface where laminar flow is present. Light has no apparent effect on spatial preference of diatoms in lotic environments. (Cassar-FRC)

AUTOMATIC CAPTURE AND PROCESSING OF ANALYTICAL DATA IN A WATER INDUSTRY LABORATORY,
Severn-Trent Water Authority, Birmingham (England).
P. J. Morley, P. R. Musty, and J. Cope.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 3, p 256-264, May, 1980. 4 Fig, 4 Tab.

Descriptors: *Water analysis, *Data processing, *Computers, Automation, Pollutant identification, Water quality, Data acquisition.

The Wang 2200C Basic programmable calculator is the basis of an automatic analytical data handling system chosen by the Severn-Trent Water authority laboratory in 1975. The parameters determined by Auto Analyzer are anionic detergent, soluble phosphate, total phosphate, ammonia-N, total N, total oxidized N, nitrate-N, and COD. Other parameters are measured and input manually. The system compares well with manual data evaluation methods in accuracy, giving a mean difference of less than 0.1 at the average concentration of 6.9 mg per liter. A sample reception system was developed to provide a test tracking system and to permit printout of results and management statistics. Use of the computer saves 7 man-hours per work day and reduces human error. (Cassar-FRC)

CURRENT WATER-RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY IN NORTH DAKOTA--FISCAL YEAR 1981.
Geological Survey, Bismarck, ND. Water Resources Div.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $7.00, Microfiche $3.50. Geological Survey Open-File Report 81-923, July, 1981. 50 p, 4 Fig. (Compiled by Martin, C. R., and Albright, L. L.).

Descriptors: *Data collections, *Groundwater, *Water quality, *Surface water, Streamflow, Runoff, Streams, Networks, Aquifers, Regional analysis, Energy, Snow surveys, *North Dakota.

Water-resources studies and investigations in North Dakota made by the U.S. Geological Survey in cooperation with State and Federal agencies are summarized. The investigations include data-collection projects, county groundwater studies, regional water-resource studies, aquifer evaluations, energy-related water-resource studies, and special investigations. The special investigations include snow survey research, groundwater quality sampling technique research and hydrologic response changes on a major stream. (USGS)

POTENTIOMETRIC SURFACE OF THE FLORIDAN AQUIFER, SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT, MAY 1981,
Geological Survey, Tampa, FL. Water Resources Div.
D. K. Yobbi, W. M. Woodham, and G. R. Schiner.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $1.75, Microfiche $0.50. Geological Survey Open-File Report 81-1006, 1981. 1 Sheet.

Descriptors: *Potentiometric level, *Groundwater, *Maps, Aquifers, Water table, Wells, Water level fluctuations, Pumping, Irrigation, *Florida, Southwest Florida Water Management.

A May 1981 potentiometric-surface map of the Southwest Florida Water Management District depicts the annual low water-level period. Potentiometric levels decreased 10 to 45 feet between September 1980 and May 1981 in the citrus and farming sections of southern Hillsborough, northern Hardee, southwestern Polk, northwestern DeSoto, and Manatee Counties. Water levels in these areas are widely affected by pumping for irrigation and have the greatest range in fluctuations. Water-level decreases ranged from 0 to 1 feet in coastal, northern, and southern areas of the Water Management District. Water levels in all of the approximate 700 wells measured in May 1981 are lower than May 1980 because of the virtual absence of rainfall in April and May. (USGS)

WATER RESOURCES DATA FOR UTAH, WATER YEAR 1979.

Geological Survey, Salt Lake City, UT. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-158981, Price codes: A99 in paper copy ($42.00), A01 in microfiche. Geological Survey Water-Data Report UT-79-1, 1980. 604 p, 7 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Utah.

Water resources data for the 1979 water year for Utah consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality of ground water. This report contains discharge records for 276 gaging stations; stage and contents for 21 lakes and reservoirs; water quality for 64 hydrologic stations, 183 partial-record stations, and 303 wells; and water levels for 36 observation wells. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Utah. (USGS)

HYDROLOGIC MAPS OF OGALLALA AQUIFER, WEST-CENTRAL KANSAS,

Geological Survey, Garden City, KS. Water Resources Div.
L. E. Dunlap, and J. M. Spinazola.
Available from the OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, Prices: $18.00 in paper copy, $2.00 in microfiche. Geological Survey Open-File Report 81-098, 1981. 4 Sheets.

Descriptors: *Maps, *Groundwater, *Approximation method, *Mathematical analysis, Hydrologic data, Water distribution, *Groundwater management, Irrigation, Aquifers, Water table, Kriging, *Kansas, Ogallala aquifer, Western Kansas Groundwater Management District No 1.

A mathematical technique, called kriging, was programmed for a computer to interpolate hydrologic data based on a network of measured values in west-central Kansas. The computer program generated estimated values at the center of each 1-mile section in the Western Kansas Groundwater Management District No. 1 and facilitated contouring of selected values that are needed in the effective management of ground water for irrigation. The kriging technique produced objective and reproducible maps that illustrated hydrologic conditions in the Ogallala aquifer, the principal source of water in west-central Kansas. Maps of the aquifer, which use a 3-year average, included the 1978-80 water-table altitudes, which ranged from about 2,580 to 3,720 feet; the 1978-80 saturated thicknesses, which ranged from about 0 to 250 feet; and the percentage changes in saturated thickness from 1950 to 1978-80, which ranged from about a 50-percent increase to a 100-percent decrease. A map showing errors of estimate also was provided as a measure of reliability for the 1978-80 water-table altitudes. Errors of estimate ranged from 2 to 24 feet. (USGS)
W82-02475

POTENTIOMETRIC SURFACE OF THE FLORIDAN AQUIFER, ST. JOHN'S RIVER WATER MANAGEMENT DISTRICT AND VICINITY, FLORIDA, MAY 1981,

Geological Survey, Orlando, FL. Water Resources Div.
G. R. Schiner, and E. C. Hayes.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $3.50, Microfiche $0.50. Geological Survey Open-File Report 81-1052, 1981. 1 Sheet.

Descriptors: *Potentiometric level, *Groundwater, *Maps, *Aquifers, Water table, Wells, Water level fluctuations, Pumping, Geohydrology, *Florida, East-central Florida, St. Johns River Water Management District.

This map presents the potentiometric surface of the Floridan aquifer in the St. Johns River Water Management District and vicinity for May 1981. The Floridan aquifer is the principal source of potable water in the area. Water-level measurements were made in approximately 1,000 wells and at several springs. The potentiometric surface is shown mostly by 5-foot contour intervals. In the Fernandina Beach area 20 and 40-foot intervals are used to show a deep cone of depression. The potentiometric surface ranged from 122 feet above NGVD (National Geodetic Vertical Datum of 1929) in Polk County to 125 feet below NGVD in Nassau County. Water levels were at record lows in many counties due to lack of rainfall. Declines were as much as 10 feet and commonly 5 feet from the May 1980 levels. (USGS)
W82-02479

WATER RESOURCES OF THE KISATCHIE WELL-FIELD AREA NEAR ALEXANDRIA, LOUISIANA,

Geological Survey, Alexandria, LA. Water Resources Div.
J. E. Rogers.
Louisiana Department of Transportation and Development. Office of Public Works Water Resources Technical Report No 26, 1981. 57 p, 7 Fig, 6 Plates, 11 Tab, 35 Ref.

Descriptors: *Groundwater, *Permeability, *Transmissivity, *Specific capacity, *Water yield, Water quality, Surface-groundwater relations, Aquifer characteristics, Aquifer testing, Water level, Wells, Infiltration, Base flow, Evapotranspiration, Chemical analysis, Hydrologic data, *Louisiana, Alexandria, Rapides Parish, Kisatchie Forest.

Sands of Miocene, Pliocene, and Pleistocene age contain freshwater in central Rapides Parish, La. In this area the base of fresh ground water ranges from 900 feet to more than 2,500 feet below National Geodetic Vertical Datum of 1929. Hydraulic conductivity of the aquifers ranges from 20 to 200 feet per day, and storage coefficient ranges from 0.0001 to 0.2. Production of water from the Kisatchie well field has been as high as 25 million gallons per day for municipal and industrial uses. The 35 wells (90-2,078 feet deep) that produce the water have yields ranging from 190 to 1,100 gallons per minute. Specific capacities range from 1.3 to 46.5 gallons per minute per foot of drawdown. Water from these wells is soft and low in dissolved solids. The pH of water from the deeper wells is greater than 7; that of water from the shallow wells is lower than 7. Additional water can be produced from the aquifers in the project area or from Spring Creek and the Calcasieu River, which have high base flow sustained by outflow from the Pleistocene deposits. The streams are an alternate source rather than an additional source of water. (USGS)
W82-02480

ESTIMATED WATER USE IN THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT AND ADJACENT AREAS, 1980,

Geological Survey, Tallahassee, FL. Water Resources Div.
A. D. Duerr, and J. T. Trommer.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $8.25, Microfiche $3.50. Geological Survey Open-File Report 81-1060, 1981. 60 p, 26 Fig, 7 Tab, 17 Ref.

Descriptors: *Water use, *Data collections, *Water management, *Water demand, Groundwater, Surface water, Water supply, Municipal water, Industrial water, Irrigation water, Withdrawal, Saline water, *Florida, Southwest Florida Management District.

Water-use data for 1980 are summarized in this report for 16 counties in the Southwest Florida Water Management District. Data include total use of ground water and surface water for each of five water-use categories. The 1980 withdrawals for each category were as follows: 290 million gallons per day for public supply, 63 million gallons per day for rural, 325 million gallons per day for industry, 416 million gallons per day for irrigation, and 6,605 million gallons per day for thermoelectric power generation. Withdrawals totaled 7,699 million gallons per day and included 983 million gallons per day of ground water and 6,716 million gallons per day of surface water. Excluding thermoelectric power generation, all water withdrawn was freshwater except 38 million gallons per day of saline ground water withdrawn for industrial use in Hillsborough County. (USGS)

WATER-RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY IN MISSOURI--FISCAL YEAR 1981.

Geological Survey, Rolla, MO. Water Resources Div.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $8.00, Microfiche $3.50. Geological Survey Open-File Report 81-683, August, 1981. 60 p, 2 Fig. (Compiled by Kratzer, W. M.).

Descriptors: *Water quality, *Surface water, *Groundwater, *Data collections, Sites, Publications, Bibliographies, Hydrologic data, Networks, Gaging stations, Crest gages, Low flow, Urban runoff, Reviews, *Missouri.

Water-resources investigations of the U.S. Geological Survey in Missouri consist of collecting hydrologic data and making interpretative investigations. The data and the results of the investigations are published or released by either the U.S. Geological Survey or by cooperating agencies. The report describes the data-collection activities and investigations in Missouri for the 1981 fiscal year and provides an extensive list of water-resources references for the State. (USGS)

SELECTED HYDROGEOLOGIC DATA FROM THE JUDITH BASIN, CENTRAL MONTANA,

Geological Survey, Helena, MT. Water Resources Div.
J. F. Levings, and K. A. Dodge.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $14.25, Microfiche $4.00. Geological Survey Open-File Report 81-1015, September, 1981. 98 p, 2 Fig, 1 Plate, 5 Tab, 6 Ref.

Descriptors: *Groundwater, *Water quality, *Data collections, *Geohydrology, Aquifers, Wells, Springs, Well logs, Water sampling, Chemical analysis, Sites, Maps, *Central Montana, Judith basin, Great Plains.

Selected hydrogeologic data from the Judith basin, central Montana, have been compiled for use as the physical basis of a ground-water model prepared as part of a 4-year study of Cenozoic and Mesozoic aquifers of the northern Great Plains area of Montana. Records of Cenozoic and Mesozoic aquifers of the northern Great Plains area of Montana. Records of 1,124 wells and 640 springs are tabulated in the report; most of these data have been collected since 1959. Lithologic logs of 68 wells are also included. Chemical data for wells and

springs include 290 water samples analyzed for major cation and anion concentrations and 282 water samples analyzed for miscellaneous-constituent concentrations. The locations of wells and springs listed in the report are shown on a map at a scale of 1:250,000. (USGS)

ALTITUDE OF THE WATER TABLE IN THE ALLUVIAL AND OTHER SHALLOW AQUIFERS ALONG THE COLORADO RIVER NEAR LA GRANGE, TEXAS, DECEMBER 1980,

Geological Survey, Austin, TX. Water Resources Div.
P. Rettman.
Available from the OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Prices: $1.00 in paper copy, $0.50 in microfiche. Geological Survey Open-File Report 81-1063, September, 1981. 1 Sheet, 1 Ref.

Descriptors: *Water table, *Maps, *Aquifers, Contours, Water level, Springs, Wells, Water yield, Groundwater movement, *Texas, La Grange, Colorado River.

The water-table contours on this map were constructed from water-level control derived from an inventory of springs and wells in the area, U.S. Geological Survey topographic maps, and from data presented by Rogers (1967). Because of the available water-level control and the rough terrain throughout the area, the delineation of the water table was limited to 20-foot contour intervals. On the basis of recent river-stage and precipitation records, this delineation should represent near or slightly below average conditions. In addition to the alluvium, several other geologic formations crop out in the areas. These formations are capable of producing small to large quantities of water to wells, but the current (1981) pumping demand is small. The pressure heads in each of these formations appear to be in continuity, and the contours indicate that no barriers restrict ground-water movement from one formation to another. Several water-producing horizons may be present at many locations. The water-table map was constructed by using the head in the horizon that is nearest the land surface. The configuration of the water table closely approximates the topography. The water table slopes from the highland areas toward the Colorado River and small creeks. The delineation of the water table in the alluvium of the Colorado River is fairly well defined, and 10-feet contour intervals may be interpreted with confidence in the area called 'potential lignite-mining area.' The water table in the bedrock aquifers is more difficult to delineate with the available data; therefore, the contours are only estimates of the position of the water table in the hilly bedrock area adjacent to the Colorado River alluvium. WATER RESOURCES DATA FOR INDIANA, WATER YEAR 1980.

Geological Survey, Indianapolis, IN. Water Resources Div.
Geological Survey Water-Data Report IN-80-1, June, 1981. 416 p, 4 Fig, 3 Tab.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collection, Sites, *Indiana.

Water resources data for the 1980 water year for Indiana consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels in wells. This report contains discharge records for 185 gaging stations, stage and contents for 12 lakes and reservoirs, releases from 6 flood-control reservoirs, water quality for 51 gaging stations, and water levels for 79 observation wells. Also included are 97 crest-stage partial-record stations and 69 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Indiana. (USGS)
W82-02492

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1980–VOLUME 4. NORTHWEST FLORIDA.

Geological Survey, Tallahassee, FL. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-136128, Price codes: $48.00 in paper copy, A01 in microfiche. Geological Survey Water-Data Report FL-80-4, August, 1981. 697 p, 46 Fig, 1 Tab, 16 Ref.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Florida, *Northwest Florida.

Water resources data for the 1980 water year in Florida consists of continuous or daily discharge for 271 streams, periodic discharge for 47 streams, continuous or daily stage for 67 streams, periodic stage for 49 streams, peak discharge for 76 streams and peak stage for 23 streams; continuous or daily elevations for 75 lakes, periodic elevations for 128 lakes; continuous ground water levels for 483 wells, periodic ground water levels for 661 wells, and miscellaneous water level measurements for 2,807 wells; quality of water data for 301 surface water sites and 842 wells. The data for northwest Florida include continuous or daily discharge for 64 streams, periodic discharge for 18 streams, peak discharge for 36 streams, and continuous or daily stage for 4 streams; continuous elevations for 4 lakes and periodic elevations for 18 lakes; continuous ground water levels for 40 wells, periodic ground water levels for 115 wells, and miscellaneous water level measurements for 295 wells; and quality of water for 36 surface water sites and for 113 wells. These data represent the National Water Data System records collected by the U.S. Geological Survey and cooperating local, State and Federal agencies in Florida. (USGS)
W82-02493

WATER RESOURCES DATA FOR PENNSYLVANIA, WATER YEAR 1980–VOLUME 3. OHIO RIVER AND ST. LAWRENCE RIVER BASINS.

Geological Survey, Harrisburg, PA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-142688, Price codes: A14 in paper copy, A01 in microfiche. Geological Survey Water-Data Report PA-80-3, October, 1981. 304 p, 7 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Pennsylvania, Ohio River basin, St. Lawrence River basin.

Water resources data for the 1980 water year for Pennsylvania consist of records of discharge and water quality of streams; elevation and contents of lakes and reservoirs; and water levels of groundwater wells. This volume contains records for water discharge at 82 gaging stations, elevations and contents at 22 lakes and reservoirs, water quality at 28 gaging stations, and water levels at 20 observation wells. Also included are data for 11 crest-stage, 11 low-flow, and 322 water-quality partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data together with the data in Volumes 1 and 2 represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, local, and Federal agencies in Pennsylvania. (USGS)

WATER RESOURCES DATA FOR WYOMING, WATER YEAR 1980–VOLUME 2. GREEN RIVER BASIN, BEAR RIVER BASIN, AND SNAKE RIVER BASIN.

Geological Survey, Cheyenne, WY. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-154337, Price codes: A09 in paper copy, A01 in microfiche. Geological Survey Water-Data Report WY-80-2, 1981. 269 p, 6 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Wyoming, Green River basin, Bear River basin, Snake River basin.

Water resources data for the 1980 water year for Wyoming consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. Volume 2 of this report contains discharge records for 62 gaging stations, stage and contents for 3 lakes and reservoirs, water quality for 38 gaging stations and 20 ungaged stations, and water levels for 7 observation wells. Also included are 24 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Wyoming. (USGS)

WATER RESOURCES DATA FOR MINNESOTA, WATER YEAR 1980–VOLUME 1. GREAT LAKES AND SOURIS-RED-RAINY RIVER BASINS.

Geological Survey, St. Paul, MN. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-130485, Price codes: A11 in paper copy, A01 in microfiche. Geological Survey Water-Data Report MN-80-1, August, 1981. 234 p, 7 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Minnesota, Great Lakes basin, Souris-Red-Rainy River basin.

Water-resources data for the 1980 water year for Minnesota consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality in wells and springs. This volume contains discharge records for 54 gaging stations; stage-only records for 1 gaging station; stage and contents for 5 lakes and reservoirs; water quality for 9 gaging stations, 1 stage station, 14 partial-record lake stations, and 5 wells; and water levels for 45 observation wells. Also included are 51 high-flow partial-record stations and 86 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data, together with the data in Volume 2, represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Minnesota. WATER RESOURCES DATA FOR KENTUCKY, WATER YEAR 1979.

Geological Survey, Louisville, KY. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-145053, Price codes: A25 in paper copy, A01 in microfiche. Geological Survey Water-Data Report KY-79-1, 1980. 582 p, 6 Fig, 3 Tab, 7 Ref.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Kentucky.

Water resources data for the 1979 water year for Kentucky consist of records of stage, discharge, and water quality of streams; stage and contents of lakes; and water levels and water quality of wells and springs. This report contains discharge records from 112 gaging stations; stage and contents for 15 lakes; water-quality for 39 stations; suspended-sediment data for 43 stations (6 daily); daily temperature for 35 stations; daily specific conductance for 23 stations; ground water levels for 70 recording, 117 partial, and 1 flowing well; water-quality data from 225 coal hydrology sites (27 partial, 198 miscellaneous), 4 springs and 29 wells; and miscellaneous temperature and specific conductance data from the 114 gaging stations. Also included are data for 124 partial-record crest-stage and 91 partial-record low-flow sites. Data collected at various miscellaneous sites is also published. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Kentucky. (USGS)

Geological Survey Water-Supply Paper 2068, 1981. 45 p, 10 Fig, 9 Plates, 8 Tab, 19 Ref.

Descriptors: *Hydrologic data, *Maps, *Coal mines, *Groundwater, *Surface water, *Water quality, Geology, Precipitation, Evaporation, Streamflow, Stream discharge, Water temperature, Monitoring, Low flow, Dissolved solids, Springs, Wells, Water analysis, Chemical analysis, *Utah, Wasatch Plateau, Book Cliffs, Coal fields.

Data obtained during a hydrologic reconnaissance in 1975-77 in the Wasatch Plateau-Book Cliffs coal area of Utah were correlated with existing long-term data. Maps were prepared showing average precipitation, average streamflow, stream temperature, ground- and surface-water quality, sediment yield, and geology. Recommendations were made for suggested approaches for continued monitoring in the coal areas. During the 1931-75 water years, the minimum discharges for the five major streams that head in the area ranged from about 12,000 to 26,000 acre-feet per year, and the maximum discharges ranged from about 59,000 to 315,000 acre-feet per year. Correlations indicate that 3 years of low-flow records at stream sites in the Wasatch Plateau would allow the development of relationships with long-term sites that can be used to estimate future low-flow records within a standard error of about 20 percent. Most water-quality degradation in streams occurs along the flanks of the Wasatch Plateau and Book Cliffs. In the uplands, dissolved-solids concentrations generally ranged from less than 100 to about 250 mg/L (milligrams per liter), and in the lowlands the concentrations ranged from about 250 to more than 6,000 mg/L. Most springs in the Wasatch Plateau and Book Cliffs discharge from the Star Point Sandstone or younger formations, and the water generally contains less than about 1,000 mg/L of dissolved solids. The discharges of 65 springs ranged from about 2.0 to 2000 gallons per minute. The Blackhawk Formation, which is the principal coalbearing formation, produces water in many of the mines. The dissolved-solids concentration in water discharging from springs and mines in the Blackhawk ranged from about 60 to 800 mg/L. (USGS)

WATER QUALITY DATA, MACKENZIE RIVER BASIN 1960-1979.

Inland Waters Directorate, Ottawa (Ontario). Water Quality Branch.
Report prepared for the Mackenzie River Basin Committee, 1981, 1081 p.

Descriptors: *Water quality, *Data collections, *Water analyses, Turbidity, Physical parameters, Alkalinity, Major ions, Numerical index, Nutrients, Metals, Percentiles, *Mackenzie River Basin, Athabasca River, NAQUADAT, Peace River, Color, Alberta, British Columbia.

The water quality data presented in this report have been collected from federal agencies and the provinces of Alberta and British Columbia. The provincial data were reformatted to be compatible with the federal data on the NAQUADAT system. The computerized National Water Quality Data Bank (NAQUADAT) is a repository for water quality information which includes chemical, physical, biological and hydrometric data for surface water, groundwater, wastewater and precipitation. Analytical methods used by the provincial agencies were compared with the analytical procedures described in the NAQUADAT Dictionary. This report presents summary data of water quality samples collected from 1960 to 1979. Since many stations were not sampled for the entire period, the sampling period (period of record) is indicated for each individual station. The data summary is organized according to the seven major sub-basins of the Mackenzie River Basin, namely: (1) Athabasca River Drainage, (2) Peace River Drainage, (3) Liard River Drainage, (4) Hay River Drainage, (5) Great Slave Lake Drainage, (6) Great Bear Lake Drainage, (7) Mackenzie River Drainage. THE USE OF GEOLOGIC, HYDROLOGIC, AND GEOCHEMICAL MAPPING TECHNIQUES IN ENVIRONMENTAL ASSESSMENT,

C. J. Coe.
Ground Water, Vol 19, No 6, p 626-634, November/December, 1981. 14 Fig, 13 Ref.

Descriptors: *Environmental effects, *Coal mining, *Mapping, Mining engineering, Manganese, Iron, Sulfate, Hydrogen ion concentration, Specific conductivity, Water quality, Path of pollutata, Groundwater movement, Water pollution effects, Drainage, Mine drainage, Hydrologic maps, Geologic mapping, Subsurface mapping, Topographic mapping, Water level, Wells, Dewatering, Dry wells, Overburden, Acidic water, Economic aspects, Legal aspects.

The environmental and economic impacts of mining can be described before, during, and after operations by using three types of maps: geologic, hydrologic, and geochemical. Geologic maps include cross-section (to define ore veins, aquifers, water-bearing zones, perched water tables, recharge areas, and groundwater movement) and structure contour maps. Static water level maps determine the configuration and transmissivity of the groundwater table. Isoconcentration maps for the desired water quality parameters define the extent of concentration fields, point source locations, and concentration gradients. Considered in tis paper are sulfate, Mn, Fe, pH, and specific conductance. Two Appalachian coal mine sites are given as illustrations. In the first case, the maps showed the location and extent of the coal seams and water bearing zones. Toxic and non-toxic strata were identified. Three groups of people complained that mining had dewatered their wells. The maps helped show that in two locations well levels were lowered by too-close spacing in a new development and by new municipal wells. However, mining activities were responsible for well dewatering along the northern area of the mining site. These wells were located on a perched water table. It was predicted that as mining progresses to the east, more residents would lose their water supplies. In the second case groundwater movement was very complex, beng partially affected by previous surface mining. The isoconcentration maps helped define water quality as affected by mining activities. PASSING FLOODWATERS OVER EMBANKMENT DAMS,

Field 8—ENGINEERING WORKS

Group 8A—Structures

Moskovskii Inzhenerno-Fizicheskii Inst. (USSR). Dynamics Lab.
Y. P. Pravidivets, and S. M. Slisaky.
International Water Power and Dam Construction, Vol 33, No 7, p 30-32, July, 1981. 2 Fig, 13 Ref.

Descriptors: *Dam construction, *Floodwater, Flood control, Cofferdams, Earth dams, Flooding, *Spillways, Overflow channels, Embankments.

A specially developed facing which allows flood waters to be passed over the face of an earth dam has been found to considerably reduce the costs of embankment dam construction. To provide stability and to protect the dam faces against erosion, riprap, wire mesh, anchored beams, or concrete slabs are used. There have been some cases where unit discharges over protected low-head embankments were as large as 40-70 cubic meters/sec/meter. With the increase of embankment height, the unit discharge over rockfill dams decreases. Protecting the slopes with packed edge-to-edge concrete cubes increases the unit discharge over an embankment structure by up to 2.5-3 times as compared with facing with crushed rock of the same size and specific gravity. Substantial economic advantages have been achieved using precast reinforced concrete wedge-shaped slabs with drainage holes as protective facing. The presence of additional hydrodynamic force on the upper slab surface brought about almost 3-5 times the reduction of the slab thickness, compared with concrete cubes of the same size. A spillway of limited width built in the river channel section of the dam has been developed which allows dimping to continue in the rest of the dam during the flood. The underlying drainage filter, drain holes, their dimensions and spacing play a substantial part in providing the stability of the slabs. The drain holes in the slabs are round and 4-5 cm in diameter, but not larger than the uppermost grain size of the filter material. The stepped toe of the spillway chute protects the embankment dam from erosion and provides the surface type conjunction of the jet and the tailwater. (Baker-FRC)

USE OF HORIZONTAL DRAINS: CASE HISTORIES FROM THE COLORADO DIVISION OF HIGHWAYS,

R. K. Barrett.
Transportation Research Record, No 783, p 20-25, 1980. 5 Fig, 4 Ref.

Descriptors: Drains, *Highway effects, *Case studies, *Drainage, *Drilling, Highways, Drain practices, Drain spacing, Drilling equipment, *Subsurface drainage, Controlled drainage, Interstitial water, Pipes, Erosion, Soil stability, Construction methods, *Drainage engineering, Colorado.

Four case histories of horizontal drains installed on Interstate 70 in the Vail, Colorado vicinity are described. In the first case, horizontal drains were used as a postconstruction alternative to a deep underdrain trench that would have cut across the roadway. In the second case, horizontal drains were used to improve drainage behind a cut slope. At the third site, horizontal drains were used to improve slope stability prior to construction of a major reinforced-earth wall. Two series of holes were drilled. Water levels were reduced to about 17 m below the ground surface. At the fourth site, the drains were used for correction of a major cut-slope failure that occurred during construction. In every case, horizontal drains contributed to the successful completion of construction, at a lower cost than many of the alternative methods of correcting for soil instability. (Titus-FRC)

LONG TERM PERFORMANCE OF HORIZONTAL DRAINS,

D. D. Smith.
Transportation Research Record, No 783, p 39-45, 1980. 10 Fig, 2 Tab, 1 Ref.

Descriptors: Drains, *Highway effects, Case studies, *Drainage, Drilling, Highways, Drain practices, Drain spacing, Drilling equipment, Subsurface drainage, Controlled drainage, Interstitial water, *Pipes, Erosion, Soil stability, Construction methods, *Drainage engineering.

Major factors that influence the performance of horizontal drains are discussed. These include location and installation methods, the frequency and quality of inspections, cleaning and maintenance programs, the types of casing used, the lithologic characteristics of the site, the pH and mineral content of the groundwater, and the protective measures necessary to preserve external features such as outlets and collector systems. The long-term performance of three drainage projects is evaluated. After 20 years, major problems encountered with the drains were rusted pipes, root growth, and the sloughing of weathered slopes which buried the outlets. (Titus-FRC)

MISSISSIPPI'S EXPERIENCE WITH HORIZONTALLY DRILLED DRAINS AND CONDUITS IN SOIL,

W. T. Ruff.
Transportation Research Record, No 783, p 35-38, 1980. 6 Fig, 2 Ref.

Descriptors: *Conduits, *Landslides, *Highway effects, *Case studies, *Drainage, Drilling, Trench drains, Highways, Drain practices, Drain spacing, Drilling equipment, Subsurface drainage, Controlled drainage, Interstitial water, Pipes, Erosion, Soil stability, Construction methods, *Drainage engineering, Mississippi.

The experience of the Mississippi Highway Department in accomplishing subsurface drainage by using horizontally drilled drains and conduits is described. Horizontal drilling plans were found to be more flexible and less risky than excavation plans. Alterations in a drilling plan can be made without affecting the completed portions. At one site, large-diameter interconnecting vertically-drilled shafts were constructed to create a drainable reservoir in a deep irregular formation. These were installed for forty percent of the cost of a braced excavation. At a second site, long horizontally drilled perforated drains were used to reduce the water table in an active landslide. Some of the major deficiencies with this technique include difficulty of maintaining a desired slope and the problem of clogged drains. (Titus-FRC)

ROCKWOOD EMBANKMENT SLIDE BETWEEN STATIONS 2001+00 AND 2018+00: A HORIZONTAL DRAIN CASE HISTORY,

W. D. Trolinger.
Transportation Research Record, No 783, p 26-30, 1980. 1 Tab.

Descriptors: *Embankments, *Water table, *Highway effects, *Case studies, *Drainage, Drilling, Trench drains, Highways, Drain practices, Drain spacing, Drilling equipment, Subsurface drainage, Controlled drainage, Interstitial water, Pipes, Erosion, Soil stability, Construction methods, *Drainage engineering, Tennessee.

Horizontal drains were installed along a highway construction site to alleviate the soil instability which produced frequent landslides on Interstate 40 in Tennessee. Areas with perched water table and zones of deep failure were located with the aid of piezometers. Horizontal drains were installed along the toe of the embankment. Vertical movement at the scarp has been reduced from 152-203 mm per year to 7.5 mm per year. (Titus-FRC)

HORIZONTAL DRAINS AND HORIZONTAL DRILLING: AN OVERVIEW,

D. L. Royster.
Transportation Research Record, No 783, p 16-20, 1980. 5 Fig, 10 Ref.

Descriptors: Drain practices, *Drain spacing, Drilling, *Interstitial water, *Pipes, Drainage, Drains, Drilling equipment, *Subsurface drainage, Controlled drainage, Water transport, Erosion, Soil stability, Construction equipment, Construction methods, *Drainage engineering.

The use of horizontal drains to remove subsurface water is reviewed. Development of polyvinyl chloride pipe, improvements in drill bits and drill stem, and the development of drilling machines capable of producing high thrust and torque have made subsurface drainage a significant and economical alternative in the repair and prevention of some types of landslides. Little is known about the effectiveness of horizontal drains in various geologic materials or about the capabilities of the drilling equipment. Use of horizontal drains is more frequent in the western region of the United States. (Titus-FRC)

FIELD STUDIES OF THE TEMPERATURE REGIME AND STRESS STATE OF THE CONCRETE IN ARCH DAMS SUBJECTED TO VARIOUS METHODS OF COOLING,

I. F. Blinov, Yu. P. Shaikin, and I. R. Gal'perin.
Hydrotechnical Construction, No 1, p 19-23, January, 1980. 2 Fig, 2 Tab, 4 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 12-15, January, 1980.

Descriptors: *Concrete technology, *Arch dams, Construction, Construction methods, Cooling, *Temperature effects, Dams, Concrete testing, Stress analysis.

During the planning stages of dam construction, the temperature requirements for the concreting of blocks are determined so that the negative effect of temperature deformations can be reduced and the appearance of thermal cracks eliminated. The temperature-stress state of concrete blocks depends on the temperature regime, the physicomechanical characteristics of the concrete, the dimensions of the block, the ratio of the elastic moduli of the elastic moduli of the block concrete and foundation bed, and additional factors. The Kasseb Dam in Tunis and the Mansur Eddakhbi Dam in Morocco are provided with monitoring and measuring instruments to study the temperature regime and deformations of the concrete in the blocks and to investigate their stress-strain state due to live loads. According to design requirements the maximum temperature of the concrete blocks in the rock zone should not exceed 36 degrees C for the Kasseb Dam or 32 degrees C for the Mansur Dam. Concrete at both dams was cooled by the continuous surface spraying of the horizontal and lateral faces, while concrete in the Mansur Dam was cooled additionally using tubes in which water cooled to 10-13 degrees C was circulated. Chilled water was also used in batching the concrete. The large differences in the structural parameters of the two dams and in the climatic conditions under which they were constructed made it possible to compare the strains of the concrete cooled by various methods such as surface spraying or tube cooling. Analysis of the data made it possible to conclude the feasibility of constructing arch dams with the parameters under consideration without use of tube cooling of the concrete in a hot climate where certain requirements are met. HIGH-HEAD VERTICAL LIFT GATES,

K. I. Mel'nichenko.

Hydrotechnical Construction, No 3, p 237-240, March, 1980. 3 Fig, 1 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 16-18, March, 1980.

Descriptors: *Gates, *Hydroelectric plants, Powerplants, Spillway gates, Dams, Hydraulic gates, Construction, *Design criteria.

A caterpillar gate with a span of 3.5 meters and height of 9.0 meters was constructed for a head of 120 meters at the Nurek hydroelectric station. Use of such gates can improve the layout, reduce the cost, and increase the reliability of hydroelectric plants, especially plants of the Nurek or Rogun type, where construction involves the driving of numerous tunnels during the entire construction period. Much has been accomplished in recent studies concerning the creation of high-head vertical lift gates, as a result of which it was possible to use them in the large construction at Nurek hydroelectric. A qualitatively new approach in the manufacture and assembly of these gates was required. Means and resources must not be dispersed for the creation of numerous new types of gates. Careful study must be made in each instance to determine which type is the best. The emergency-guard ring-follower gate of the spillway of the Inguri hydrostation should be considered the most reliable and most perfect of the gates designed by special designs departments in this area. The gate is suitable for use in conduits in both the construction and operating periods. (Baker-FRC)

FLEXIBLE OUTFALL AT ALDEBURGH,
Anglian Water Authority (England).
A. L. Davis.
Effluent and Water Treatment Journal, Vol 20, No 7, p 338-340, 342, July, 1980. 4 Fig, 2 Tab, 6 Ref.

Descriptors: *Outfall sewers, *Flexibility, *Pipes, Underwater, Wastewater disposal, Design criteria, *Aldeburgh, *England, Costs.

A flexible sewage sea outfall was designed and installed at Aldeburgh, Suffolk, a town whose population ranges from 3500 to 5000 depending on the season. The pipe, constructed of high density polyethylene with layers of cotton tape, steel tape, polyvinyl chloride tape, galvanized steel wires, jute and asphalt, and an outside coat of helical-wound, asphalt-coated 2 mm steel wires, has a 202 mm internal diameter and is 1.3 km long. The discharge point is 10-12 meters deep and in a relatively level area of the sea bed. There are two diffusers, each 125 mm in diameter. Modeling pollution data revealed that the probable E. coli count would be 900 per 100 ml when the sewage field was under the influence of strong on-shore winds. Float tests indicated that beaching of floats may occur upon release of sewage shortly before a combination of high tide and easterly on-shore winds. Costs of pipe supply, laying, and burial were 250,000 pounds sterling, or 192 pounds sterling per meter. (Cassar-FRC)

SKI-JUMP SPILLWAY FOR INDIA'S UKAI DAM,
Central Designs Organisation, Gujarat State (India). Irrigation Dept.
V. N. Kulkarni, and I. C. Patel.
International Water Power and Dam Construction, Vol 33, No 9, p 44-48, September, 1981. 2 Fig, 2 Tab, 4 Ref.

Descriptors: *Dams, *Spillways, Overflow channels, Construction methods, *Ukai dam, *India, Scour, Erosion, *Performance evaluation.

The Ukai earth dam across the Tapi River in Gujarat, India, has a masonry spillway and incorporates a powerhouse. The dam is part of a multipurpose scheme designed to provide irrigation, flood control and 300 MV of hydropower. The spillway with 22 radial gates is on the left bank of the river. The discharge rate of the spillway is about 97.6 cubic meters/second/meter. The occurrence of Deccan traps in the impact area and the availability of a standing pool of water created by the Kalkrapar weir 30 kilometers downstream favored the provision of a ski-jump type of bucket rather than a stilling basin. The spillway has been in operation since 1971. The maximum scour, about 29 meters deep, was noted in the tail channel opposite spillway gates 8, 9, and 10, and more scour about 12 meters deep was noted downstream of spillway gates 18 and 19. The pattern is being watched; it now appears to be stabilizing, so that no further scour or retrogression is anticipated that might need large-scale protective measures. Model studies of the erosion of rock from the impact area of the ski-jump were performed. It is believed that the mobile bed consisting of sand or gravel effectively represented the rocky condition found at the site. The benefit of the ski-jump as opposed to stilling basins or roller buckets is that with the ski-jump, erosion takes place away from the structure. Considering the usual tendency of the scour pocket to form away from the dam, the performance of the bucket thus far is rated satisfactory. (Baker-FRC)

TURBULENCE MODEL FOR FLOW OVER DREDGED CHANNELS,
Thessaloniki Univ., Salonika (Greece). Dept. of Hydraulics.
C. Koutitas, and B. O'Connor.
Journal of the Hydraulics Division. Proceedings of the American Society of Civil Engineers, Vol 107, No HY8, p 989-1002, August, 1981. 12 Fig, 11 Ref.

Descriptors: *Turbulent flow, *Channels, *Flow characteristics, Model studies, Dredging, Silting, Sediment transport, Computer models.

Computer methods were used to reproduce flow and mixing patterns in a steep-sided channel dredged at right angles to the main direction of flow and sediment transport. The mixed finite-difference/finite-element method was acceptable for modeling both uniform and nonuniform steady flows. These computer methods, based on fundamental flow equations, used a hydrostatic pressure approximation, which worked better where main flow was nearly horizontal than where flow converged and was more vertical. The method can be used either with mixing length models or with one-equation turbulence models. The one-equation turbulence model produced a better fit to laboratory data and obviated the problem of singular kinematic eddy viscosity values. (Cassar-FRC)

8C. Hydraulic Machinery

HYDRAULIC GATES,
J. Lewin.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 3, p 237-255, May, 1980. 9 Fig, 1 Tab, 51 Ref.

Descriptors: *Hydraulic gates, *Design criteria, *Radial gates, Gates, Bibliographies, Reviews, Roller gates, Spillway gates, Sluice gates, Ice, Vibrations, Seals, Control system.

This paper summarizes design aspects of low head and vertical lift hydraulic gates, commonly used in rivers, canals, and reservoir spillways. Radial gates are actuated by the water level upstream or downstream of the gate. Forces exerted on the gate by changes in the displacers in each side pier cause the gate to open and close. Vertical lift gates are usually of the fixed roller type, with either side guide rollers or water lubricated slippers to provide transverse stability. Bottom hinged flap gates are used to prevent intrusion of saline water into a fresh water course. Design of bottom and side seals is important to prevent excess leakage and interference of debris. Design considerations discussed are coefficient of discharge (0.3-0.6 for submerged discharge and 0.5 to 0.7 for free discharge), jet contraction coefficient for the discharge under a vertical flat sluice gate, hydraulic downpull forces, guide roller grooves, structural analysis to avoid vibrations, and methods of removing debris and ice. Operating machinery is described. Seals for top, bottom, and sides of the gates are of many types: bulb seals in the shape of musical notes (usually solid), L-shaped seals (used in one-plane movement), double-stem or center bulb seals (for face contact and sealing the top edge of submerged vertical lift gates and radial culvert gates), vibrations--preventing self-exciting vibrations, reduction of the rate of self-control and sufficient structural strength and rigidity to withstand the hydrodynamic load. (Cassar-FRC)

8D. Soil Mechanics

THE STEADY STATE OF DEFORMATION,
Geotechnical Engineers Inc., Winchester, MA.
S. J. Poulos.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No GT5, p 553-562, May, 1981. 2 Fig, 15 Ref.

Descriptors: *Deformation, *Soil properties, Soil mechanics, Soil horizons, Soil profiles, Soil dynamics, Shear stress, Strength, Stress, Shear tests, Soil types, Liquefaction, Interstitial water, Drainage.

The concept of steady-state deformation in particulate media is defined and explained with special reference to soils. The steady state deformation for any mass of particles is that state in which the mass is continuously deforming at constant volume, constant normal effective stress, constant shear stress, and constant velocity. This steady state is achieved only after all particle orientation has reached a statistically steady-state condition and after all particle breakage, if any, is complete, so that the shear stress needed to continue deformation and the velocity of deformation remain constant. Several practical applications of the concept of steady-state deformation include the understanding of pore pressures measured in situ before, during and well after a failure to more clearly understand the causes of the failure, the selection of shear strength when analyzing the stability of slopes and the selection of an appropriate factor of safety based on improved knowledge, the correct selection of apparatus for particular applications as they relate to the shape of the stress-strain curve, and understanding the relationship between the stress-strain curves of sands and those of clays in clearer terms. Terminology such as 'normally consolidated' and 'loose' can be understood in terms of soil behavior as opposed to 'over-consolidated' and 'dense'. (Baker-FRC)
W82-02235

RELATIONSHIP OF ELECTRICAL DISPERSION TO SOIL PROPERTIES,
Battelle Memorial Inst., Columbus, OH.
S. S. Smith, and K. Arulanandan.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No GT5, p 591-604, May, 1981. 8 Fig, 3 Tab, 15 Ref.

Descriptors: *Soil properties, *Electric currents, *Hydraulic permeability, Permeability, Permeability coefficient, Soil texture, Pore size, Pores, Soil porosity, Model studies, Minerals.

In an effort to develop a nondestructive method for studying and predicting engineering properties of fine grained soils, a simplified three element electrical model is presented to represent the complicated soil-water system. The model exhibits a theoretical apparent dielectric and conductivity dispersion in the radio frequency range. The parameters of the model are both compositional and heterogeneous (structural). For a particular soil system, the numerical values of the model param-

eters can be determined by computer curve fitting the theoretical equations of the model to the experimentally determined radio frequency apparent dielectric and conductivity dispersion curves of the soil. The fundamental nature of electrical dispersion in fine grained soils and the three numerical parameters of the model present an effective nondestructive tool for studying the engineering behavior of soils in a fundamental, quantitative manner. The pertinent results of three studies are included in the paper. The three studies included evaluate the model's ability to monitor structural changes during the hydration of soil cement, the relationship between dielectric constant of wet soil cluster and swell potential, and the relationship between the size and distribution of intercluster pores and hydraulic permeability. 8E. Rock Mechanics and Geology

A FORMULA FOR ESTIMATING FISSURE TRANSMISSIVITIES FROM STEADY-STATE INJECTION-TEST DATA,
Institute of Geological Sciences, Wallingford (England).
J. A. Barker.
Journal of Hydrology, Vol 52, No 3/4, p 337-346, July, 1981. 4 Fig, 1 Tab, 4 Ref.

Descriptors: *Transmissivity, *Geologic fractures, *Permeability coefficient, *Hydraulic conductivity, Hydraulic engineering, Mathematical studies, Estimating equations, Injection.

A formula was developed for estimating fissure transmissivities in a rock formation from steady-state injection-testing between two inflated packers in a borehole. Sample data for injection into a fissure is used to demonstrate practical application of the formula. In most cases transmissivity can be calculated by an iterative procedure. Errors introduced by non-Darcian flow and finite packer-separation can be calculated by extrapolation. Two equations are presented which can estimate errors resulting from inaccuracies in the measurements. Thus, local hydraulic conductivity can be determined fairly simply for a rock formation. MEMBRANE LINER SEALS 278-ACRE RESERVOIR.
Public Works, Vol 112, No 2, p 72-74, February, 1981.

Descriptors: *Reservoir linings, *Hydroelectric plants, *Forebays, Materials engineering, Materials testing, Seepage, Seepage control, Environmental effects, Penstocks, *Plastics, Powerplants, Leadville, Colorado.

The world's largest single-cell membrane reservoir liner was installed in a 278-acre forebay reservoir near Leadville, Colorado by B. F. Goodrich. The reservoir will be part of the Mt. Elbert Power Plant which will service Colorado customers during peak load hours. Water will be released from the forebay through two 180-inch diameter penstocks, and drop 445 feet to drive two 100-megawatt turbine generators. The water is released to Twin Lakes where it may be pumped back to the forebay reservoir during periods of low demand. Before the liner was installed, indications of seepage of water through the soil from the reservoir caused project engineers to decide on the installation of the liner. The contract price for installation of the liner was set at $17.8 million. Complication earth-moving and processing operations were required before liner installation. The liner is made of chlorinated polyethylene of three ply construction with a total thickness of 45 mils. Each panel was laboratory tested for integrity before installation. Environmental impact tests by the Federal Government on the Mt. Elbert installation and the Fryingpan-Arkansas Project started several years ago. Possible dispersion of sediments into the water due to turbulence is expected to be minimal, as are dangers to public safety. (Geiger-FRC)

TRENDS IN WASTEWATER COLLECTION SYSTEMS,
G. E. Symons.
Water/Engineering and Management, Vol 128, No 4, p 10, 90, April, 1981.

Descriptors: *Wastewater management, *Reviews, Regulations, Catchment basins, Design criteria, Pipes, Flow measurement, *Construction materials, *Sewer systems, Costs.

Large increases in cost of sewer construction have been noted over the past 20 years in the wastewater collection systems industry. The cost of sewer construction in 1980 was 4 times the cost in 1957-59. Other trends have also occurred, but have been less obvious. Changes have occurred in materials of construction and in problems of management. Sewers were constructed of brick and cement mortar or tile, concrete poured in wooden forms, monolithic concrete sewer, and finally prestressed concrete pipes of almost any size, evolving to the presently used materials. Forcemains changed from cast-iron through cement-lined steel, to concrete and plastic. Wastewater treatment processes also became more sophisticated. Flow measurement has increased in accuracy. Federal legislation, regulations and implementation policies have forced designers, managers, and operators to improve the sampling of sewers to determine the character of the wastes. Of large current interest is the matter of combined-sewer overflows and how to control them. The use of stormwater detention is under study. Surface detention areas such as athletic fields, parking lots, and rooftops have been considered, but problems with water stagnation and mosquitoes may be experienced. Minimization of safety hazards in sewers caused by hydrogen sulfide is receiving increased attention. Computer management is being investigated. A sewer maintenance program is not required by EPA regulations as a condition for treatment plant construction awards. (Baker-FRC)

Tennessee Univ., Knoxville. Graduate School of Planning.
G. E. Bowen, and T. R. Gangaware.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153552, Price codes: A03 in paper copy, A01 in microfiche. Report prepared for Office of Water Research and Technology, May, 1981. 43 p. OWRT-C-90234-U(9434)(1), 14-34-0001-9434.

Descriptors: *Bibliographies, *Water quality management, *Institutional constraints, Urban planning, Water pollution, *Information retrieval, Publications.

This volume of the report, the annotated bibliography, was intended to be a basic reference source for persons engaged in water quality planning, management, and research. The annotations are divided into six basic categories: books, periodicals, government publications, conference proceedings, water resource center reports and others. (Gangaware-Tenn)
W82-02103

10D. Specialized Information Center Services

IDENTIFICATION CODES FOR ORGANIZATIONS LISTED IN COMPUTERIZED DATA SYSTEMS OF THE U.S. GEOLOGICAL SURVEY,
Geological Survey, Reston, VA. Water Resources Div.
M. D. Edwards, and B. M. Myers.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Paper copy $14.00, Microfiche $3.50. Geological Survey Open-File Report 81-904 (supersedes Open-File Report 80-555), 1981. 102 p, 1 Fig, 2 Ref.

Descriptors: *Data storage and retrieval, *Information exchange, *Organizations, Indexing, Data transmission, *Organization identification code, Computerized data systems, *U.S. Geological Survey, National Water Data Exchange(NAWDEX).

This report contains codes for the identification of public and private organizations listed in computerized data systems. These codes are used by the U.S. Geological Survey's National Water Data Exchange (NAWDEX), National Water Data Storage and Retrieval System (WATSTORE), National Cartographic Information Center (NCIC), and Office of Water Data Coordination (OWDC). The format structure of the codes is discussed and instructions are given for requesting new codes. (USGS)
W82-02486

SUBJECT INDEX

ABSORPTION
Cadmium, Copper, Lead, Zinc and Manganese in the Polychaete Arenicola Marina from Sediments Around the Coast of Wales,
W82-02416 5A

ACID MINE DRAINAGE
Delineation of Acid Mine Drainage Potential of Coal-Bearing Strata of the Pottsville and Allegheny Groups in Western Pennsylvania,
W82-02534 6A

ACID RAIN
International Conference on the Effects of Acid Rain Urges More Research in Critical Areas,
W82-02311 5C

ACIDIC WATER
Liming Acid Ponds in New York,
W82-02572 5G

ACTIVATED CARBON
Chemical Pretreatment for Activated-Carbon Adsorption,
W82-02234 5F

Dupont's Wastewater Treatment Approach,
W82-02254 5D

Specific Organic Removals by Granular Activated Carbon Pilot Contactors,
W82-02260 5F

Pilot-Scale Investigations with Granular Activated Carbon,
W82-02289 5D

Trihalomethane Precursor Control by Adsorption,
W82-02598 5F

ACTIVATED SLUDGE
Effect of the Earthworm, Eisenia Foetida (Oligochaeta), on Fluxes of Volatile Carbon and Sulfur Compounds from Sewage Sludge,
W82-02362 5E

An Investigation of the Influence of Bacteriophages on the Bacterial Flora and Purification Powers of Activated Sludge,
W82-02433 5E

Influence of Dissolved Oxygen on Activated Sludge Viability,
W82-02582 5D

ACTIVATED SLUDGE PROCESS
Engineering Design Variables for the Activated Sludge Process,
W82-02199 5D

Simulation of a Time Dependent Activated Sludge Wastewater Treatment Plant,
W82-02303 5D

ADMINISTRATION
Effluent Charging Systems and Their Administrative Implications,
W82-02403 6C

The Effect of EEC Directives on Water Supplies,
W82-02432 6E

ADMINISTRATIVE DECISIONS
Decision-Making Constraints in the Policy Development and Administration of Water Resources in West Virginia,
W82-02173 6E

ADMINISTRATIVE REGULATIONS
New Developments in Water Resources Management for Local Governments and Industries,
W82-02522 6E

ADSORPTION
Pathways and Mechanisms for Removal of Dissolved Organic Carbon from Leaf Leachate in Streams,
W82-02222 5B

Chemical Pretreatment for Activated-Carbon Adsorption,
W82-02234 5F

Main Compounds Behavior in Kraft Wastes Cleaning by Acid Coagulation and Carbon Adsorption,
W82-02383 5D

Trihalomethane Precursor Control by Adsorption,
W82-02598 5F

ADVANCED WASTEWATER TREATMENT
Evaluation of Membrane Processes and Their Role in Wastewater Reclamation: Volume II,
W82-02457 5D

ADVECTION
Evapotranspiration and Leaf Water Status of Alfalfa Growing Under Advective Conditions,
W82-02295 2D

AERATION
Hypolimnetic Aeration of a Small Eutrophic Kettle Lake: Physical and Chemical Changes,
W82-02341 5G

AEROSOLS
Sources of Twelve Trace Metals in Antarctic Snows Determined by Principal Component Analysis,
W82-02378 5B

AGRICULTURAL ENGINEERING
Deriving Sediment Yield Probabilities for Evaluating Conservation Practices,
W82-02225 2J

Effect of Corn and Soybean Row Spacing on Plant Canopy, Erosion, and Runoff,
W82-02264 2I

AGRICULTURAL RUNOFF
Sediment Yield from a Mississippi Delta Cotton Field,
W82-02324 2J

Simulation Model for Agricultural Non-Point-Source Pollution,
W82-02504 5B

Effect of Drainage System Design and Operation on Nitrate Transport,
W82-02505 5B

AGRICULTURAL WATERSHEDS
Comparison of Behavior of Two Sub-Basins in the Turtle Creek Drainage System,
W82-02528 2A

ALABAMA
Water Law, Water Conservation and the Development of Energy Resources in the Coastal, Offshore and Flood Plain Areas of Alabama,
W82-02535 5G

ALASKA
Major- and Trace-Element Composition of Suspended Matter in the North-East Gulf of Alaska: Relationships with Major Sources,
W82-02259 5B

Summer Population Fluctuations, Feeding, and Growth of Hydra in an Arctic Lake,
W82-02287 2H

Composition and Vertical Flux of Organic Matter in a Large Alaskan Estuary,
W82-02347 2L

Sediment Transport in the Tanana River Near Fairbanks, Alaska, 1977-79,
W82-02472 2J

ALDEBURGH
Flexible Outfall at Aldeburgh,
W82-02415 8A

ALFALFA
Evapotranspiration and Leaf Water Status of Alfalfa Growing Under Advective Conditions,
W82-02295 2D

ALGAE
Heavy Metals and Marine Phytoplankton: Correlation of Toxicity and Sulfhydryl-Binding,
W82-02272 5C

Quantitative Differences Between Benthic Algal Communities Along a Depth Gradient in Lake Michigan,
W82-02299 2H

Periphyton Production in an Appalachian Mountain Trout Stream,
W82-02335 5C

Relationship Between Water Quality and the Community Structure of Epiphytic Diatoms in a Mississippi Bayou,
W82-02531 6G

The Study of Phosphorus and Nitrogen Fluxes in Enriched Isolation Columns,
W82-02563 5C

Algal Polymorphism in High Rate Wastewater Treatment Ponds,
W82-02564 5D

ALGAE HARVESTING
Environmental Phenotypic Variation of Scenedesmus Dimorphus in High-Rate Algae Ponds and Its Relationship to Wastewater Treatment and Biomass Production,
W82-02275 5D

ALGAL CONTROL
Chemical and Biological Processes Controlling the Response of a Freshwater Ecosystem to Copper Stress: A Field Study of the CuSO4 Treatment of Mill Pond Reservoir, Burlington, Massachusetts,
W82-02233 5C

ALGAL GROWTH
Productivity and Species Composition of Algal Mat Communities Exposed to a Fluctuating Thermal Regime,
W82-02356 5C

Structural Characteristics of Algal Communities in Thermal Altered Artificial Streams,
W82-02399 5C

ALGICIDES
The Physico-Chemical and Planktonic Response of an Algicide-Treated Shallow Mountain Lake in Arizona,
W82-02571 5G

ALLOTMENTS
Water Rights on Indian Allotments,
W82-02363 6E

ALTERNATIVE PLANNING
Interactive Nonstructural Flood-Control Planning,
W82-02320 6F

ALUM
Optimizing Coagulants and Flocculant Aids for Settling,
W82-02409 5F

AMINO ACIDS
Geochemistry of Amino Acids in Sediments from Clear Lake, California,
W82-02545 2K

AMMONIA
Economic Impact of Existing Ammonia Nitrogen Water Quality Standard, IPCB Chapter 3, Rule 203 (F),
W82-02189 5D

Nitrate and Ammonia Uptake in the Apex of the New York Bight,
W82-02286 5C

Determination of Ammonia in Estuary,
W82-02390 5A

AMMONIUM COMPOUNDS
Economic Impact of Existing Ammonia Nitrogen Water Quality Standard, IPCB Chapter 3, Rule 203 (F),
W82-02189 5D

AMPHIPODS
Relationship Between Populations of Amphipods and Pollution,
W82-02444 5C

ANADROMOUS FISH
Influences of Freshwater Inflow on Chinook Salmon (Oncorhynchus Tshawytscha) in the Sacramento-San Joaquin Estuary,
W82-02142 6G

ANALOG COMPUTERS
Possibility of Investigating Open-Channel Flows on an Analog Computer,
W82-02389 6A

ANIMAL WASTES
Economic and Technical Evaluations of Swine Manure Management Systems Which Use Land Applications,
W82-02175 5E

ANTARCTIC
Sources of Twelve Trace Metals in Antarctic Snows Determined by Principal Component Analysis,
W82-02378 5B

ANTIBIOTICS
Agglutination and Bactericidal Responses of the Channel Catfish to Salmonella Paratyphi,
W82-02524 5C

ANTIMONY
The Spectrophotometric Determination of Antimony in Water, Effluents, Marine Plants and Silicates,
W82-02355 5A

APPROXIMATION METHOD
Hydrologic Maps of Ogallala Aquifer, West-Central Kansas,
W82-02475 7C

AQUATIC ANIMALS
An Evaluation of Aquatic Life Found at Hydraulic Scour Sites in the Columbia River Estuary Selected for Potential Sediment Deposition,
W82-02132 2L

Some Effects of Fresh Water on the Atchafalaya Bay System,
W82-02143 6G

AQUATIC BACTERIA
Algal-Bacterial Symbiosis in the Chowan River, NC,
W82-02177 5A

AQUATIC ENVIRONMENT
Recent Trends in Environmental Impact Assessment,
W82-02525 6G

AQUATIC ENVIRONMENTS
Model Experiments on the Growth of Enteric Bacteria in Fresh and Sea Water,
W82-02377 5A

AQUATIC FUNGI
Seasonal and Diurnal Fluctuations of Oomycete Propagule Numbers in the Free Water of a Freshwater Lake,
W82-02274 2H

AQUATIC HABITATS
On the Occurrence of Bimodal Diel Dissolved Oxygen Curves in Aquatic Systems,
W82-02565 2H

AQUATIC LIFE
Metabolism of a Desert Stream,
W82-02349 1A

Productivity and Species Composition of Algal Mat Communities Exposed to a Fluctuating Thermal Regime,
W82-02356 5C

Aquatic Biology of the Redwood Creek and Mill Creek Drainage Basins, Redwood National Park, Humboldt and Del Norte Counties, California,
W82-02484 4C

AQUATIC PLANTS
Metabolism of a Florida Lake Ecosystem,
W82-02268 2H

Some Analyses of Aquatic Plants and Their Waters,
W82-02293 2H

Productivity of Four Marsh Sites Surrounding Lake Pontchartrain, Louisiana,
W82-02334 2H

Seasonal Patterns of Plant and Soil Water Potential on an Irregularly-Flooded Tidal Marsh,
W82-02340 2I

Growth and Photosynthesis of Najas Marina L. as Affected by Light Intensity,
W82-02365 4A

Concepts in Aquatic Treatment System Design,
W82-02593 5D

AQUATIC POPULATIONS
Relationship Between Populations of Amphipods and Pollution,
W82-02444 5C

AQUATIC WEED CONTROL
Biological Control of Aquatic Weeds in Southwest Florida,
W82-02285 4A

Control of Aquatic Weeds with Hexazinone,
W82-02326 4A

Evaluation of Water Quality During Herbicide Applications to Kerr Lake, OK,
W82-02327 5B

Diquat and Sodium Alginate for Weed Control in Rivers,
W82-02328 4A

Preliminary Evaluation of Hydrogen Peroxide as a Potential Herbicide for Aquatic Weeds,
W82-02329 4A

Relationships Between Pond Sediments and Simazine Loss from Waters of Laboratory Systems,
W82-02330 5B

AQUIFER CHARACTERISTICS
Ground Water in Washington,
W82-02536 2F

AQUIFER MANAGEMENT
Assessment of Eighteen Public Groundwater Supplies in Illinois,
W82-02510 2F

Management of Interstate Aquifer Systems,
W82-02578 4B

AQUIFER TESTING
Simulation of an Aquifer Test on the Tesuque Pueblo Grant, New Mexico,
W82-02465 2F

AQUIFERS
Aquifer Response Due to Zones of Higher Permeability and Storage Coefficient,
W82-02190 2F

Thermal Convection in a Nonhomogeneous Aquifer,
W82-02288 2F

The Importance of Drift Deposit Influences on the Hydrogeology of Major British Aquifers,
W82-02437 2F

Ground-Water Data for Michigan 1980,
W82-02467 2F

Potentiometric Surface of the Floridan Aquifer, St. John's River Water Management District and Vicinity, Florida, May 1981,
W82-02479 7C

The Availability of Ground Water in Western Montgomery County, Maryland,
W82-02481 2F

Altitude of the Water Table in the Alluvial and Other Shallow Aquifers Along the Colorado River Near La Grange, Texas, December 1980,
W82-02491 7C

Assessment of Eighteen Public Groundwater Supplies in Illinois,
W82-02510 2F

Management of Interstate Aquifer Systems,
W82-02578 4B

ARCH DAMS
Field Studies of the Temperature Regime and Stress State of the Concrete in Arch Dams Subjected to Various Methods of Cooling,
W82-02387 8A

ARCTIC
Snowmelt, Glacier Melt, and High Arctic Streamflow Regimes,
W82-02249 2A

Summer Population Fluctuations, Feeding, and Growth of Hydra in an Arctic Lake,
W82-02287 2H

ARID LANDS
Metabolism of a Desert Stream,
W82-02349 1A

ARIZONA
Metabolism of a Desert Stream,
W82-02349 1A

Flash Flood in Arizona - Observations and Their Application to the Identification of Flash-Flood Deposits in the Geologic Record,
W82-02350 2A

The Physico-Chemical and Planktonic Response of an Algicide-Treated Shallow Mountain Lake in Arizona,
W82-02571 5G

ARKANSAS
Adjusting Government Role in Water Law.
W82-02256 6E

Water-Quality Reconnaissance of the Larkin Creek Watershed, Lee and St. Francis Counties, Arkansas,
W82-02489 5A

ARKANSAS RIVER BASIN
Rainfall-Runoff Modeling and Preliminary Regional Flood Characteristics of Small Rural Watersheds in the Arkansas River Basin in Colorado,
W82-02462 2A

AROMATIC COMPOUNDS
Distribution of Polycyclic Aromatic Hydrocarbons in Sediments from Estuaries of Southeastern Australia,
W82-02438 5B

ARTIFICIAL LAKES
Meromixis in a Coastal Zone Excavation,
W82-02120 2H

Water Budget and Projected Water Quality in Proposed Man-Made Lakes Near Estuaries in the Marco Island Area, Florida,
W82-02122 5B

ASHURST LAKE
The Physico-Chemical and Planktonic Response of an Algicide-Treated Shallow Mountain Lake in Arizona,
W82-02571 5G

Major Ion Chemistry in a Tropical African Lake Basin,
W82-02440 2K

CHEMICAL OXYGEN DEMAND
Continuous-Flow Injection Analysis of Aqueous Environmental Samples for Chemical Oxygen Demand,
W82-02203 5A

Ceriometry, A Combined Method for Chemical Oxygen Demand and Dissolved Oxygen (With a Discussion on the Precision of the Winkler Technique),
W82-02562 5A

CHEMICAL PRECIPITATION
A Compendium of Experimental Work on Chemical Precipitation of Sewage,
W82-02370 5D

CHEMICAL PROPERTIES
Origin of Isotopic and Geochemical Ratio Gradients in Karst Water of the Jura Mountains. (Sur L'Origine des Gradients de Teneurs Isotopiques et Geochimiques dans les eaux Karstiques du Jura (France)),
W82-02422 2F

CHEMICAL WASTES
Comparison of Groundwater and Surface Water for Patterns and Levels of Contamination by Toxic Substances,
W82-02541 5A

CHEMICAL WASTEWATER
Industrial Wastewater Pretreatment Service,
W82-02253 5E

Dupont's Wastewater Treatment Approach,
W82-02254 5D

CHEMISTRY OF PRECIPITATION
International Conference on the Effects of Acid Rain Urges More Research in Critical Areas,
W82-02311 5C

CHEMOCLINE
Meromixis in a Coastal Zone Excavation,
W82-02120 2H

CHESAPEAKE BAY
Chesapeake Bay Low Freshwater Inflow Study,
W82-02114 6G

Aspects of Impacts Assessment of Low Freshwater Inflows to Chesapapeake Bay,
W82-02115 6G

Assessment Methodologies for Freshwater Inflows to Chesapeake Bay,
W82-02118 5B

Freshwater Inflow to Estuaries, Short and Long Term Perspectives,
W82-02158 2L

Seasonal Patterns of Plant and Soil Water Potential on an Irregularly-Flooded Tidal Marsh,
W82-02340 2I

CHICAGO
Real-Time Rainfall Monitoring-Prediction System and Urban Hydrologic Operations,
W82-02588 7A

CHINOOK BELT
Snow Barrier Potential for Harvesting Moisture in Transects Across Chinook Areas in Montana--Summary Report,
W82-02539 2C

CHLORIDE
Increases in Sodium and Chloride in the Mohawk River, New York, from the 1950's to the 1970's Attributed to Road Salt,
W82-02262 5B

CHLORIDES
The Ground Water Flow System in the Vicinity of Marco Island, Florida,
W82-02123 2F

Treatment of Effluent Waters Containing Chlorides by Reverse Osmosis Dynamically Formed Membranes,
W82-02382 5D

CHLORINATED HYDROCARBONS
Transport and Fate of Selected Organic Pollutants in a Sandy Soil,
W82-02220 5B

Trihalomethane Precursor Control by Adsorption,
W82-02598 5F

CHLORINATION
Detection of Chloroform in the Tissues of Freshly Eviscerated Poultry Carcasses Exposed to Water Containing Added Chlorine or Chlorine Dioxide,
W82-02374 5A

CHLOROFORM
Detection of Chloroform in the Tissues of Freshly Eviscerated Poultry Carcasses Exposed to Water Containing Added Chlorine or Chlorine Dioxide,
W82-02374 5A

CHLOROPHYLL
Dissolved Humic Substances: A Major Source of Error in Fluorometric Analyses Involving Lake Waters,
W82-02223 5A

CHOWAN RIVER
Algal-Bacterial Symbiosis in the Chowan River, NC,
W82-02177 5A

CLAMS
A Comparison of the Incidence of Five Pathological Conditions in Soft-Shell Clams, Mya Arenaria, from Environments with Various Pollution Histories,
W82-02357 5C

CLARIFICATION
Water Clarification and Decolorization with Regenerable Magnetic Particles,
W82-02351 5F

CLARIFIERS
Upward Flow Clarification of Secondary Sewage Effluent Using Lime,
W82-02413 5D

CLEAR-CUTTING
The Effect of Forest Clearcutting in New England on Stream-Water Chemistry and Biology,
W82-02178 4C

CLIMATES
Precipitation Trends and Variability in the Vicinity of Northwest Gulf Coast: 1900-1980,
W82-02159 2L

CLIMATOLOGY
Climatic Relationships of Permafrost Zones in Areas of Low Winter Snow-Cover,
W82-02239 2C

Dendroclimatic Estimates of a Drought Index for Northern Virginia,
W82-02468 2B

130,000-Yr Continuous Pollen Record from Clear Lake, Lake County, California,
W82-02544 2K

CLOUD SEEDING
An Initial Application of Polarization Lidar for Orographic Cloud Seeding Operations,
W82-02217 7B

COAGULATION
Optimizing Coagulants and Flocculant Aids for Settling,
W82-02409 5F

COAL GASIFICATION
Thiocyanate Bio-Oxidation Kinetics,
W82-02596 5D

COAL MINES
Hydrologic Reconnaissance of the Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W82-02500 7C

COAL MINING
Delineation of Acid Mine Drainage Potential of Coal-Bearing Strata of the Pottsville and Allegheny Groups in Western Pennsylvania,
W82-02534 6A

The Use of Geologic, Hydrologic, and Geochemical Mapping Techniques in Environmental Assessment,
W82-02546 7C

COASTAL AQUIFERS
Salt-Water Intrusion in the Costa De Hermosillo, Mexico: A Numerical Analysis of Water Management Proposals,
W82-02547 5B

COASTAL MARSHES
Freshwater Inflow and Salt Water Barriers for Management of Coastal Wildlife and Plants in Louisiana,
W82-02144 6G

COASTAL WATERS
Seasonal Variation in the Trace Metal Content of Mytilus Edulis,
W82-02312 5C

Relationship Between Populations of Amphipods and Pollution,
W82-02444 5C

Benthic Enrichment in the Georgia Bight Related to Gulf Stream Intrusions and Estuarine Outwelling,
W82-02583 2L

COASTAL ZONE MANAGEMENT
Federal and State Coastal Zone Management Efforts Directed at Estuaries and Freshwater Inflow,
W82-02113 6E

Freshwater Inflow and Salt Water Barriers for Management of Coastal Wildlife and Plants in Louisiana,
W82-02144 6G

Establishment of Controlled Freshwater Diversions of the Mississippi River into the Louisiana Coastal Zone,
W82-02145 4A

Values of Ecological Characterization Studies to Assess Effects of Freshwater Inflow to Estuaries,
W82-02147 6G

Water Law, Water Conservation and the Development of Energy Resources in the Coastal, Offshore and Flood Plain Areas of Alabama,
W82-02535 5G

COASTS
Values of Ecological Characterization Studies to Assess Effects of Freshwater Inflow to Estuaries,
W82-02147 6G

COLD REGIONS
Climatic Relationships of Permafrost Zones in Areas of Low Winter Snow-Cover,
W82-02239 2C

COLIFORMS
A-1 Medium: Alternative Technique for Fecal Coliform Organism Enumeration in Chlorinated Wastewaters,
W82-02339 5A

Aspects of Water Pollution in Lake Naini Tal, U.P., India,
W82-02442 5C

COLIPHAGES
Distribution of Ribonucleic Acid Coliphages in Raw Sewage from Treatment Plants in Japan,
W82-02443 5A

COLLOIDS
Post-Treatment Process for Reverse Osmosis Membranes,
W82-02454 3A

COLOR REMOVAL
Methods for Treatment of Color in Groundwater,
W82-02532 5F

COLORADO
Waterlogging Control for Improved Water and Land Use Efficiencies: A Systematic Analysis,
W82-02455 6A

Rainfall-Runoff Modeling and Preliminary Regional Flood Characteristics of Small Rural Watersheds in the Arkansas River Basin in Colorado,
W82-02462 2A

Analysis of Firm Water Supply Under Complex Institutional Constraints,
W82-02501 6A

COLORADO RIVER
The Mouth of the Colorado River Project; An Economic Development Environmental Enhancement Project,
W82-02148 4A

Loss of Colorado River Inflows to Matagorda Bay, Texas, and Efforts for Restoration,
W82-02151 4A

Colorado River Simulation System; An Executive Summary,
W82-02170 6A

COLORADO RIVER BASIN
Salinity Forum: What. How. Why.
W82-02587 6E

COLORIMETRY
Determination of Ammonia in Estuary,
W82-02390 5A

New Supplementary DPD Procedures Using Sodium Nitrite for (a) Bromine-Bromamine Separation and (b) Correction of Chlorine Dioxide Readings for Any Bromine Derived from Natural Bromide in Waters,
W82-02394 5A

COLUMBIA RIVER
Water Management on the Columbia River,
W82-02112 6D

Freshwater Inflow to the Columbia River Estuary; A Northwest Regional Management Issue,
W82-02155 6D

COLUMBIA RIVER ESTUARY
An Evaluation of Aquatic Life Found at Hydraulic Scour Sites in the Columbia River Estuary Selected for Potential Sediment Deposition,
W82-02132 2L

Concentration, Extent, and Duration of Salinity Intrusion into the Columbia River Estuary, September-October, 1977-1978,
W82-02139 2L

COMMERCIAL FISH
Agglutination and Bactericidal Responses of the Channel Catfish to Salmonella Paratyphi,
W82-02524 5C

COMMON LAW
Legal, Economic and Institutional Barriers to Water Reuse in Northern New England, Boston, Massachusetts,
W82-02107 3C

COMPETING USE
Water Management on the Columbia River,
W82-02112 6D

COMPUTER MODELS
Colorado River Simulation System; An Executive Summary,
W82-02170 6A

Weekly Multipurpose Planning Model for TVA Reservoir System,
W82-02319 6A

Development of a Prototype Method for Training Users of Water Resources Planning Models: Phase I,
W82-02540 6A

Optimal Stream-Aquifer Development,
W82-02575 6A

COMPUTER PROGRAMS
Loop Equations with Unknown Pipe Characteristics,
W82-02258 3F

Interactive Nonstructural Flood-Control Planning,
W82-02320 6F

COMPUTERS
Automatic Capture and Processing of Analytical Data in a Water Industry Laboratory,
W82-02207 7C

How Computers Have Changed Water Works Operations,
W82-02276 5F

Possibility of Investigating Open-Channel Flows on an Analog Computer,
W82-02389 6A

CONCRETE TECHNOLOGY
Field Studies of the Temperature Regime and Stress State of the Concrete in Arch Dams Subjected to Various Methods of Cooling,
W82-02387 8A

CONDUITS
Mississippi's Experience with Horizontally Drilled Drains and Conduits in Soil,
W82-02213 8A

CONFERENCES
International Conference on the Effects of Acid Rain Urges More Research in Critical Areas,
W82-02311 5C

CONFINED AQUIFERS
Unsteady Free Flow to a Ditch from an Artesian Aquifer,
W82-02369 2F

CONNECTICUT
PCBs in the Housatonic River: Determination and Distribution,
W82-02255 5A

CONSEQUENT STREAMS
Regional Hydrogeologic Concepts of Homoclinal Flanks,
W82-02548 2F

CONSTRUCTION MATERIALS
Trends in Wastewater Collection Systems,
W82-02573 8G

CONSUMPTIVE USE
Chesapeake Bay Low Freshwater Inflow Study,
W82-02114 6G

COPEPODS
Variation in Life-History Patterns Between Intertidal and Subtidal Populations of the Meiobenthic Copepod Microarthridion Littorale,
W82-02560 2L

COPPER
A Study on the Accumulation of Copper and Zinc in the Mid-Gut Gland of Cultured Scallop for Environmental Monitoring, (In Japanese),
W82-02379 5B

COPPER SULFATE
Chemical and Biological Processes Controlling the Response of a Freshwater Ecosystem to Copper Stress: A Field Study of the CuSO4 Treatment of Mill Pond Reservoir, Burlington, Massachusetts,
W82-02233 5C

CORN
The Evaluation of a Leaf-Water Potential Function for Corn,
W82-02226 2I

CORPUS CHRISTI BAY ESTUARY TEXAS
Estuarine Benthic Community Dynamics Related to Freshwater Inflow to the Corpus Christi Bay Estuary,
W82-02135 2L

COST ANALYSIS
Economic and Technical Evaluations of Swine Manure Management Systems Which Use Land Applications,
W82-02175 5E

Cost of Small Water Supply Treatment Systems,
W82-02318 5F

COST-BENEFIT ANALYSIS
Desalting Demonstration Plant Feasibility Study at Laguna Pueblo, New Mexico.
W82-02104 3A

Management, Planning, and Organization in Initiating, Supporting and Coordinating an Ongoing Freshwater Diversion Project,
W82-02153 6B

Freshwater Inflow to the Columbia River Estuary; A Northwest Regional Management Issue,
W82-02155 6D

In-Home Conservation and Wastewater Management,
W82-02591 3D

COST-SHARING
Trends in State and Federal Policy on Water Supply Management,
W82-02516 6E

Water Savings in the Orange Water and Sewer Authority,
W82-02519 3D

COSTA DE HERMOSILLO
Salt-Water Intrusion in the Costa De Hermosillo, Mexico: A Numerical Analysis of Water Management Proposals,
W82-02547 5B

COSTS
The Dilution/Flushing Technique in Lake Restoration,
W82-02270 2H

Effluent Charging Systems and Their Administrative Implications,
W82-02403 6C

Wastewater Collection and Treatment in Wayne County,
W82-02554 5D

Energy Costs and Portland Water Supply System,
W82-02586 5F

CROP PRODUCTION
Aerated Drip Irrigation,
W82-02186 3F

CROP YIELD
Solar Heat Pond System,
W82-02187 3F

Wheat Response to Drought,
W82-02242 2I

Leaf Photosynthesis, Leaf Permeability, Crop Growth, and Yield of Short Spring Wheat Genotypes under Irrigation,
W82-02373 2I

Irrigation Requirements of Field-Pea for Grain,
W82-02395 2I

CROP YIELDS
Effect of Saline Irrigation Water on the Yield of Potato,
W82-02396 3C

CROPS
Effects of Salinization Treatments on Growth and Some Related Physiological Activities of Some Leguminous Plants,
W82-02381 3F

CRUSTACEANS
Rainfall-Related Trends in the Structure of a Fish-Crustacean Community in Texas' Galveston Bay System,
W82-02160 2L

CUMULATIVE RUNOFF
Use of Cumulants to Estimate Coefficients in Chow-Kulandaiswamy's GHS Model,
W82-02208 2A

CYANOPHYTA
Algal-Bacterial Symbiosis in the Chowan River, NC,
W82-02177 5A

DABOB BAY
The Early Diagenesis of Aliphatic Hydrocarbons and Organic Matter in Sedimentary Particulates from Dabob Bay, Washington,
W82-02310 5B

DAM CONSTRUCTION
Passing Floodwaters Over Embankment Dams,
W82-02204 8A

DAMS
The Relative Influence of Dams and Secular Climatic Change on Downstream Flooding, Australia,
W82-02425 2E

Ski-Jump Spillway for India's Ukai Dam,
W82-02430 8A

DATA ACQUISITION
A Dynamic Methodology for Characterizing and Monitoring Estuarine Ecosystems,
W82-02167 7A

DATA COLLECTIONS
Current Water-Resources Investigations of the U.S. Geological Survey in North Dakota--Fiscal Year 1981.
W82-02463 7C

Water Levels in Bedrock Aquifers in South Dakota,
W82-02466 2F

Estimated Water Use in the Southwest Florida Water Management District and Adjacent Areas, 1980,
W82-02482 7C

Water-Resources Investigations of the U.S. Geological Survey in Missouri--Fiscal Year 1981.
W82-02488 7C

Water-Quality Reconnaissance of the Larkin Creek Watershed, Lee and St. Francis Counties, Arkansas,
W82-02489 5A

Selected Hydrogeologic Data from the Judith Basin, Central Montana,
W82-02490 7C

Water Quality Data, Mackenzie River Basin 1960-1979.
W82-02506 7C

DATA PROCESSING
Automatic Capture and Processing of Analytical Data in a Water Industry Laboratory,
W82-02207 7C

DATA STORAGE AND RETRIEVAL
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W82-02486 10D

DECISION MAKING
Decision-Making Constraints in the Policy Development and Administration of Water Resources in West Virginia,
W82-02173 6E

DECOMPOSITION
Effect of the Earthworm, Eisenia Foetida (Oligochaeta), on Fluxes of Volatile Carbon and Sulfur Compounds from Sewage Sludge,
W82-02362 5E

DECONTAMINATION
New Jersey Community Decontaminates Well Water.
W82-02243 5F

DEFORMATION
The Steady State of Deformation,
W82-02235 8D

DEGRADATION
Fate of Diflubenzuron in Water,
W82-02216 5B

Relationships Between Pond Sediments and Simazine Loss from Waters of Laboratory Systems,
W82-02330 5B

DEICERS
Increases in Sodium and Chloride in the Mohawk River, New York, from the 1950's to the 1970's Attributed to Road Salt,
W82-02262 5B

DELAWARE
Phytoplankton Production and Community Composition in a Marsh-Dominated Estuary Which Receives Sewage Waste,
W82-02179 5C

DELTAS
Atchafalaya Delta: Subaerial Development; Environmental Implications and Resource Potential,
W82-02126 2J

DENDROCHRONOLOGY
Dendroclimatic Estimates of a Drought Index for Northern Virginia,
W82-02468 2B

DENITRIFICATION
Application of the Expanded Bed Technique for the Denitrification of a Sewage Effluent,
W82-02436 5D

DENMARK
Denmark's State of the Environment,
W82-02401 5B

Growth of Mytilus Edulis in Net Bags Transferred to Different Localities in a Eutrophicated Danish Fjord,
W82-02428 5C

DENSITY CURRENTS
Formation of a Bottom Flow in a Natural Water Body with Various Types of Density Stratification,
W82-02205 2J

DEPOSITION
The Importance of Drift Deposit Influences on the Hydrogeology of Major British Aquifers,
W82-02437 2F

DESALINATION
Desalting Demonstration Plant Feasibility Study at Laguna Pueblo, New Mexico.
W82-02104 3A

Operating Characteristics of Various Combinations of Working Substances and Feeds in the Schroeder Desalting Process.
W82-02105 3A

Non-Acid Pretreatment and Management of Microorganisms in Seawater Desalination by Reverse Osmosis,
W82-02108 3A

Development of High Salt Rejection Reverse Osmosis Membranes--Final Report, July 1, 1978 Through December 31, 1980,
W82-02109 3A

Draft Environmental Assessment Desalting Demonstration Plant, Laguna, New Mexico.
W82-02171 3A

Post-Treatment Process for Reverse Osmosis Membranes,
W82-02454 3A

DESALINATION APPARATUS
Operating Characteristics of Various Combinations of Working Substances and Feeds in the Schroeder Desalting Process.
W82-02105 3A

DESIGN CRITERIA
Engineering Design Variables for the Activated Sludge Process.
W82-02199 5D

Hydraulic Gates,
W82-02206 8C

Surface Water Hydrologic Criteria for Uranium Mine Tailings Impoundments in Ontario,
W82-02240 5E

Solid Set Irrigation System Design Using Linear Programming,
W82-02273 6A

High-Head Vertical Lift Gates,
W82-02388 8A

Optimal Stream-Aquifer Development,
W82-02575 6A

DESIGN FLOODS
Flood Event Modeling - A Study of Two Methods,
W82-02291 2A

DETENTION RESERVOIRS
Comparison of Detention Basin Planning and Design Models,
W82-02592 6A

DETRITUS
A New Approach to Determining the Quantitative Relationship Between Fishery Production and the Flow of Fresh Water to Estuaries,
W82-02130 4C

DEVELOPING COUNTRIES
Environmental Repercussions of Irrigation Development in Hot Climates,
W82-02366 6G

Systems Analysis Applied to Water Management in Developing Countries: Problems and Prospects,
W82-02441 6A

DEWATERING
Reassessment of the Effects of Construction Dewatering on Ground-Water Levels in the Cowles Unit, Indiana Dunes National Lakeshore, Indiana. Supplement to Geological Survey Water-Resources Investigations 78-138,
W82-02478 4A

DIATOMS
Heavy Metals and Marine Phytoplankton: Correlation of Toxicity and Sulfhydryl-Binding,
W82-02272 5C

Relationship Between Water Quality and the Community Structure of Epiphytic Diatoms in a Mississippi Bayou,
W82-02531 6G

The Effect of Current on the Distribution of Diatoms Settling on Submerged Glass Slides,
W82-02567 7B

DIEL VARIATIONS
Diel Changes in Plankton and Water Chemistry in Wicken Brickpit,
W82-02411 2H

DIFFUSERS
Multiport Diffuser Mixing Zones in Rivers,
W82-02594 5B

DIFLUBENZURON
Fate of Diflubenzuron in Water,
W82-02216 5B

DIQUAT
Diquat and Sodium Alginate for Weed Control in Rivers,
W82-02328 4A

DISSOLVED OXYGEN
Continuous Simulation of Receiving Water Quality Transients,
W82-02271 5B

Ceriometry, A Combined Method for Chemical Oxygen Demand and Dissolved Oxygen (With a Discussion on the Precision of the Winkler Technique),
W82-02562 5A

On the Occurrence of Bimodal Diel Dissolved Oxygen Curves in Aquatic Systems,
W82-02565 2H

Influence of Dissolved Oxygen on Activated Sludge Viability,
W82-02582 5D

DISTILLATION PROCESSES
Operating Characteristics of Various Combinations of Working Substances and Feeds in the Schroeder Desalting Process.
W82-02105 3A

DISTRIBUTION
The Integrity of Existing Distribution Systems,
W82-02450 5F

DISTRIBUTION PATTERNS
Quantitative Differences Between Benthic Algal Communities Along a Depth Gradient in Lake Michigan,
W82-02299 2H

The Effect of Current on the Distribution of Diatoms Settling on Submerged Glass Slides,
W82-02567 7B

Benthic Enrichment in the Georgia Bight Related to Gulf Stream Intrusions and Estuarine Outwelling,
W82-02583 2L

DISTRICT OF COLUMBIA
Photosynthetic Pigments as Indicators of Algal Activity in the Upper Potomac Estuary,
W82-02529 5B

DIURNAL DISTRIBUTION
Diurnal Variation in Water Potential Components and Stomatal Resistance of Irrigated Peach Seedlings,
W82-02202 2I

DIVERGING-CONVERGING WATERSHEDS
Water Routing on Diverging-Converging Watersheds,
W82-02200 2A

DIVERSION
Effects of Wetland Changes on the Fish and Wildlife Resources of Coastal Louisiana,
W82-02129 4C

Management, Planning, and Organization in Initiating, Supporting and Coordinating an Ongoing Freshwater Diversion Project,
W82-02153 6B

Effects of Lake Michigan Diversion on the Water Chemistry of the Illinois Waterway,
W82-02261 6G

DIVERSION CHANNELS
The Mouth of the Colorado River Project; An Economic Development Environmental Enhancement Project,
W82-02148 4A

Effects of Alterations of Freshwater Inflows into Matagorda Bay, Texas,
W82-02149 6G

Loss of Colorado River Inflows to Matagorda Bay, Texas, and Efforts for Restoration,
W82-02151 4A

DIVERSION LOSSES
Methods of Computation and Ecological Regulation of the Salinity Regime in Estuaries and Shallow Seas in Connection with Water Regulation for Human Requirements,
W82-02169 5G

DIVERSION STRUCTURES
Freshwater Introduction into Louisiana Coastal Areas,
W82-02127 4A

Automated Stream Diversion for Reservoir Protection,
W82-02600 5G

DOMESTIC WASTES
Microbial Purification of Recycled Wastewater in a Closed System,
W82-02172 5D

DOMESTIC WATER
In-Home Conservation and Wastewater Management,
W82-02591 3D

DRAIN SPACING
Horizontal Drains and Horizontal Drilling: An Overview,
W82-02215 8A

DRAINAGE
Use of Horizontal Drains: Case Histories from the Colorado Division of Highways,
W82-02211 8A

Long Term Performance of Horizontal Drains,
W82-02212 8A

Mississippi's Experience with Horizontally Drilled Drains and Conduits in Soil,
W82-02213 8A

Rockwood Embankment Slide Between Stations 2001+00 and 2018+00: A Horizontal Drain Case History,
W82-02214 8A

A Two-Dimensional Finite-Element Solution Scheme for the Saturated-Unsaturated Flow with Applications to Flow Through Ditch-Drained Soils,
W82-02283 2F

Effect of Drainage System Design and Operation on Nitrate Transport,
W82-02505 5B

DRAINAGE DITCHES
Effects of Upland Drainage on Estuarine Nursery Areas of Pamlico Sound, North Carolina,
W82-02164 2L

DRAINAGE ENGINEERING
Use of Horizontal Drains: Case Histories from the Colorado Division of Highways,
W82-02211 8A

Long Term Performance of Horizontal Drains,
W82-02212 8A

Mississippi's Experience with Horizontally Drilled Drains and Conduits in Soil,
W82-02213 8A

Rockwood Embankment Slide Between Stations 2001+00 and 2018+00: A Horizontal Drain Case History,
W82-02214 8A

Horizontal Drains and Horizontal Drilling: An Overview,
W82-02215 8A

DRAINAGE SYSTEMS
Methods of Restoring the Delivery of Drainage Wells,
W82-02385 4A

DRAINAGE WELLS
Methods of Restoring the Delivery of Drainage Wells,
W82-02385 4A

DRAINS
Wastewater Collection and Treatment in Wayne County,
W82-02554 5D

DRAWDOWN
Induced Sinkholes: An Engineering Problem,
W82-02559 4B

DREDGING
Chemical Availability of Cadmium in Mississippi River Sediment,
W82-02267 5B

DRILLING

Use of Horizontal Drains: Case Histories from the Colorado Division of Highways,
W82-02211 8A

Treated Pit Fluids Meet Water Specifications.
W82-02557 5E

DRILLING FLUIDS

Treated Pit Fluids Meet Water Specifications.
W82-02557 5E

DRINKING WATER

Determination of 2,4-Dichlorophenoxyacetic Acid and Silvex in Water with High-Performance Liquid Chromatography,
W82-02298 5A

An Assessment of Current Standards for Selenium in Drinking Water,
W82-02372 6F

Reducing Plumbosolvency - The Effect of Added Lime on the Loch Katrine Supply to Glasgow,
W82-02446 5F

The Integrity of Existing Distribution Systems,
W82-02450 5F

DRIP IRRIGATION

Aerated Drip Irrigation,
W82-02186 3F

DROUGHT

Distribution of Joint Run-Lengths of Bivariate Markov Processes,
W82-02191 2E

Wheat Response to Drought,
W82-02242 2I

Dendroclimatic Estimates of a Drought Index for Northern Virginia,
W82-02468 2B

Rate Structures and Demand Reduction,
W82-02517 6C

DUPONT COMPANY

Dupont's Wastewater Treatment Approach,
W82-02254 5D

DYNAMIC PROGRAMMING

Weekly Multipurpose Planning Model for TVA Reservoir System,
W82-02319 6A

EARTHWORMS

Effect of the Earthworm, Eisenia Foetida (Oligochaeta), on Fluxes of Volatile Carbon and Sulfur Compounds from Sewage Sludge,
W82-02362 5E

ECOLOGICAL EFFECTS

Characterization of Freshwater Inflow Modification to Estuaries Resulting from River Basin Development,
W82-02162 6G

The Effect of Forest Clearcutting in New England on Stream-Water Chemistry and Biology,
W82-02178 4C

An Industrial View. Treatment Vis-A-Vis Discharge to Sewers,
W82-02407 6G

ECONOMIC ASPECTS

Institutional Barriers to Water Quality Planning and Management in the Southeast - Vol I - Technical Report, Part I - Institutional Barriers,
W82-02101 6E

The Economic Significance of the Long Point Marsh, Lake Erie, as a Recreational Resource,
W82-02229 6B

Wastewater Management in Coastal North Carolina,
W82-02511 5D

Rate Structures and Demand Reduction,
W82-02517 6C

ECONOMIC EFFECTS

The Effect of EEC Directives on Water Supplies,
W82-02432 6E

ECONOMIC FEASIBILITY

Appalachian Regional Commission and the Coastal Plains Regional Commission,
W82-02515 6E

ECONOMIC IMPACT

Economic Impact of Existing Ammonia Nitrogen Water Quality Standard, IPCB Chapter 3, Rule 203 (F),
W82-02189 5D

ECONOMIES OF SCALE

Analytical Cost Model for Urban Water Supply,
W82-02584 6C

ECOSYSTEMS

Some Effects of Fresh Water on the Atchafalaya Bay System,
W82-02143 6G

Freshwater Inflow and Salt Water Barriers for Management of Coastal Wildlife and Plants in Louisiana,
W82-02144 6G

Values of Ecological Characterization Studies to Assess Effects of Freshwater Inflow to Estuaries,
W82-02147 6G

Scientific Progress and Deteriorating Ecosystems; San Francisco Bay and the 1970's,
W82-02156 6E

The River Continuum: A Theoretical Construct for Analysis of River Ecosystems,
W82-02157 6G

Rainfall-Related Trends in the Structure of a Fish-Crustacean Community in Texas' Galveston Bay System,
W82-02160 2L

Strategies for the Management of Estuaries,
W82-02166 6F

Recent Trends in Environmental Impact Assessment,
W82-02525 6G

EDEN RIVER

Diquat and Sodium Alginate for Weed Control in Rivers,
W82-02328 4A

EDUCATION

Development of a Prototype Method for Training Users of Water Resources Planning Models: Phase I,
W82-02540 6A

EFFLUENT CHARGES

Effluent Charging Systems and Their Administrative Implications,
W82-02403 6C

EFFLUENT LIMITATIONS

Legal, Economic and Institutional Barriers to Water Reuse in Northern New England, Boston, Massachusetts,
W82-02107 3C

The Design of Sea Outfalls with Reference to EEC Amenity Water Pollution Criteria,
W82-02449 5E

EFFLUENT STANDARDS

Supreme Court Clarifies Water Act Requirement,
W82-02257 6E

EFFLUENTS

Multiport Diffuser Mixing Zones in Rivers,
W82-02594 5B

EGYPT

Waterborne Disease Is Prevalent in Egypt,
W82-02435 5C

ELECTRIC CURRENTS

Relationship of Electrical Dispersion to Soil Properties,
W82-02561 8D

ELECTRIC POWERPLANTS

Effect of Pembroke Power Station on the Temperatures in Milford Haven, Wales,
W82-02406 5C

EMBANKMENTS

Rockwood Embankment Slide Between Stations 2001+00 and 2018+00: A Horizontal Drain Case History,
W82-02214 8A

ENERGY

Energy Costs and Portland Water Supply System,
W82-02586 5F

ENERGY CONSERVATION

Processes--Not Products--Biggest Energy-Saving Factors.
W82-02218 5D

ENGINEERING

Assessment of the National Water Quality Management Program, Volume 2: Construction Grants.
W82-02182 6E

ENGLAND

Seasonal Variation in the Trace Metal Content of Mytilus Edulis,
W82-02312 5C

Diquat and Sodium Alginate for Weed Control in Rivers,
W82-02328 4A

Beddington Sewage-Treatment Works, Canyon: Some Operating Experiences 1969-79,
W82-02410 5D

Flexible Outfall at Aldeburgh,
W82-02415 8A

ENTERIC BACTERIA

Model Experiments on the Growth of Enteric Bacteria in Fresh and Sea Water,
W82-02377 5A

ENTEROVIRUSES

Development of Immunoenzymatic Methods for Detection and Quantitation of Poliovirus,
W82-02176 5A

ENVIRONMENTAL CONTROL

Environmental Control Technology Development for Geothermal Energy,
W82-02197 5C

Simulation of Nutrient Balances in a Shallow and Polluted River: A Strategy for Environmental Control,
W82-02354 5B

Water Law, Water Conservation and the Development of Energy Resources in the Coastal, Offshore and Flood Plain Areas of Alabama,
W82-02535 5G

ENVIRONMENTAL EFFECTS
Aspects of Impacts Assessment of Low Freshwater Inflows to Chesapeake Bay,
W82-02115 6G

Freshwater Influences on Striped Bass Population Dynamics,
W82-02116 6G

Effects of Freshwater Flow on Fishery Resources in the Sacramento-San Joaquin Estuary,
W82-02141 4C

Influences of Freshwater Inflow on Chinook Salmon (Oncorhynchus Tshawytscha) in the Sacramento-San Joaquin Estuary,
W82-02142 6G

Some Effects of Fresh Water on the Atchafalaya Bay System,
W82-02143 6G

Effects of Alterations of Freshwater Inflows into Matagorda Bay, Texas,
W82-02149 6G

Loss of Colorado River Inflows to Matagorda Bay, Texas, and Efforts for Restoration,
W82-02151 4A

The River Continuum: A Theoretical Construct for Analysis of River Ecosystems,
W82-02157 6G

Santee-Cooper Rediversion: Projected Impacts on Fishery Resources and Wildlife Habitats,
W82-02168 4A

Methods of Computation and Ecological Regulation of the Salinity Regime in Estuaries and Shallow Seas in Connection with Water Regulation for Human Requirements,
W82-02169 5G

Draft Environmental Assessment Desalting Demonstration Plant, Laguna, New Mexico.
W82-02171 3A

The Effect of Forest Clearcutting in New England on Stream-Water Chemistry and Biology,
W82-02178 4C

Effects of Lake Michigan Diversion on the Water Chemistry of the Illinois Waterway,
W82-02261 6G

Hydropower: Untapped Resource and Environmental Hazard,
W82-02277 5C

Environmental Repercussions of Irrigation Developement in Hot Climates,
W82-02366 6G

Some Environmental Impacts of a Storm Surge Barrier,
W82-02417 6G

The Use of Geologic, Hydrologic, and Geochemical Mapping Techniques in Environmental Assessment,
W82-02546 7C

Sludge: Back into the Ocean,
W82-02577 5E

History of Human-Use Impacts on Long Point Bay,
W82-02580 5B

ENVIRONMENTAL IMPACT STATEMENT
Recent Trends in Environmental Impact Assessment,
W82-02525 6G

ENVIRONMENTAL POLICY
Strategies for the Management of Estuaries,
W82-02166 6F

ENVIRONMENTAL PROTECTION
An Overview of Texas Law, Policy, and Agency Actions Concerning Estuarine Inflow,
W82-02154 6E

Methods of Computation and Ecological Regulation of the Salinity Regime in Estuaries and Shallow Seas in Connection with Water Regulation for Human Requirements,
W82-02169 5G

User Reaction to Wild and Scenic River Designation,
W82-02278 6G

EPHEMERAL STREAMS
Preliminary Appraisal of Ephemeral-Streamflow Characteristics as Related to Drainage Area, Active-Channel Width, and Soils in Northwestern New Mexico,
W82-02476 2E

EPIPHYTIC ALGAE
Relationship Between Water Quality and the Community Structure of Epiphytic Diatoms in a Mississippi Bayou,
W82-02531 6G

EROSION
Establishment of Controlled Freshwater Diversions of the Mississippi River into the Louisiana Coastal Zone.
W82-02145 4A

Aerial Photography to Detect Rill Erosion,
W82-02232 7B

Verification of the Slope Factor in the Universal Soil Loss Equation for Low Slopes,
W82-02246 2J

EROSION CONTROL
Effect of Corn and Soybean Row Spacing on Plant Canopy, Erosion, and Runoff,
W82-02264 2I

Water Resources Protection Measures in Land Development - A Handbook - Revised Edition,
W82-02453 4D

EROSION RATES
Sediment Yield from a Mississippi Delta Cotton Field,
W82-02324 2J

ESSEX COUNTY
Flood of November 26-27, 1979, in Essex County, New York,
W82-02483 2E

ESTUARIES
Water Management on the Columbia River,
W82-02112 6D

Federal and State Coastal Zone Management Efforts Directed at Estuaries and Freshwater Inflow,
W82-02113 6E

Freshwater Influences on Striped Bass Population Dynamics,
W82-02116 6G

Historical Background and Overview of Plan for Restoring Freshwater Inflow to an Estuary in Conjunction with Urban Development,
W82-02119 4A

Flow Regime and Sediment Load Affected by Alterations of the Mississippi River,
W82-02125 4C

Atchafalaya Delta: Subaerial Development; Environmental Implications and Resource Potential,
W82-02126 2J

Freshwater Introduction into Louisiana Coastal Areas,
W82-02127 4A

A New Approach to Determining the Quantitative Relationship Between Fishery Production and the Flow of Fresh Water to Estuaries,
W82-02130 4C

Nutrient Flux Between the Nueces Deltaic Marsh and the Nueces Estuary on the Texas Gulf Coast,
W82-02134 2L

The Influence of Salinity Transition on Benthic Nutrient Regeneration in Estuaries,
W82-02137 2L

Monitoring Freshwater Inflow to Estuaries by Remote Sensing,
W82-02138 7A

Concentration, Extent, and Duration of Salinity Intrusion into the Columbia River Estuary, September-October, 1977-1978,
W82-02139 2L

The Nutritional Significance of the Distribution of Suspended Particulate Material in the Upper San-Francisco Bay-Estuary,
W82-02140 2L

Effects of Freshwater Flow on Fishery Resources in the Sacramento-San Joaquin Estuary,
W82-02141 4C

Influences of Freshwater Inflow on Chinook Salmon (Oncorhynchus Tshawytscha) in the Sacramento-San Joaquin Estuary,
W82-02142 6G

Some Effects of Fresh Water on the Atchafalaya Bay System,
W82-02143 6G

Establishment of Controlled Freshwater Diversions of the Mississippi River into the Louisiana Coastal Zone,
W82-02145 4A

Values of Ecological Characterization Studies to Assess Effects of Freshwater Inflow to Estuaries,
W82-02147 6G

The Mouth of the Colorado River Project; An Economic Development Environmental Enhancement Project,
W82-02148 4A

Sediment--Asset or Liability,
W82-02150 6B

Overview of Freshwater Inflow Depletions,
W82-02152 6D

An Overview of Texas Law, Policy, and Agency Actions Concerning Estuarine Inflow,
W82-02154 6E

Freshwater Inflow to the Columbia River Estuary; A Northwest Regional Management Issue,
W82-02155 6D

Scientific Progress and Deteriorating Ecosystems; San Francisco Bay and the 1970's,
W82-02156 6E

Freshwater Inflow to Estuaries, Short and Long Term Perspectives,
W82-02158 2L

Precipitation Trends and Variability in the Vicinity of Northwest Gulf Coast: 1900-1980,
W82-02159 2L

Characterization of Freshwater Inflow Modification to Estuaries Resulting from River Basin Development,
W82-02162 6G

A Dynamic Methodology for Characterizing and Monitoring Estuarine Ecosystems,
W82-02167 7A

Methods of Computation and Ecological Regulation of the Salinity Regime in Estuaries and Shallow Seas in Connection with Water Regulation for Human Requirements,
W82-02169 5G

A Numerical Simulation of the Vertical and Horizontal M2 Tide in the Bristol Channel and Comparisons with Observed Data,
W82-02193 2L

Seasonal Variation of Vitamin B12, B12 Analogs, and Phytoplankton in a Long Island Estuary,
W82-02282 2L

Zooplankton Sample Variability in a Tidal Estuary: An Interpretative Model,
W82-02306 2L

The Early Diagenesis of Aliphatic Hydrocarbons and Organic Matter in Sedimentary Particulates from Dabob Bay, Washington,
W82-02310 5B

On the Advection of Turbidity in the Saint Lawrence Middle Estuary,
W82-02344 2L

The Dynamics of Conservative Mixing in Estuaries,
W82-02345 2L

Composition and Vertical Flux of Organic Matter in a Large Alaskan Estuary,
W82-02347 2L

Determination of Ammonia in Estuary,
W82-02390 5A

Sewage Outfall Location Reduces Environmental Damage in the Thames Estuary,
W82-02404 5G

Effect of Pembroke Power Station on the Temperatures in Milford Haven, Wales,
W82-02406 5C

Estuarine and Marine Coastal Pollution in the Republic of Ireland,
W82-02418 5B

Seasonal Variation in the Prevalence of 'Red Spot' Disease in Estuarine Fish with Particular Reference to the Sea Mullet, Mugil Cephalus L.,
W82-02426 2L

Discussion of Trace Metals in the Waters of a Partially-Mixed Estuary,
W82-02542 2L

ESTUARINE ENVIRONMENT

Freshwater Inputs and Estuarine Productivity,
W82-02110 2L

Management of Freshwater Inflow to Estuaries: A Lawyer's Perspective,
W82-02111 6E

Chesapeake Bay Low Freshwater Inflow Study,
W82-02114 6G

Aspects of Impacts Assessment of Low Freshwater Inflows to Chesapeake Bay,
W82-02115 6G

Effects of Freshwater Flow on Salinity and Phytoplankton Biomass in the Lower Hudson Estuary,
W82-02117 2L

Assessment Methodologies for Freshwater Inflows to Chesapeake Bay,
W82-02118 5B

Biological Considerations Related to Freshwater Introduction in Coastal Louisiana,
W82-02128 4C

Effects of Wetland Changes on the Fish and Wildlife Resources of Coastal Louisiana,
W82-02129 4C

An Evaluation of Aquatic Life Found at Hydraulic Scour Sites in the Columbia River Estuary Selected for Potential Sediment Deposition,
W82-02132 2L

The Effects of Freshwater Inflow on Salinity and Zooplankton Populations at Four Stations in the Nueces-Corpus Christi and Copano-Aransas Bay Systems, Texas from October 1972-May 1975,
W82-02133 6G

Estuarine Benthic Community Dynamics Related to Freshwater Inflow to the Corpus Christi Bay Estuary,
W82-02135 2L

The Effects of Floods on the Zooplankton Assemblage of San Antonio Bay, Texas During 1972 and 1973,
W82-02136 2L

Review of Estuarine-Related Projects by the Gulf of Mexico Fishery Management Council,
W82-02146 6G

Loss of Colorado River Inflows to Matagorda Bay, Texas, and Efforts for Restoration,
W82-02151 4A

Precipitation Trends and Variability in the Vicinity of Northwest Gulf Coast: 1900-1980,
W82-02159 2L

Rainfall-Related Trends in the Structure of a Fish-Crustacean Community in Texas' Galveston Bay System,
W82-02160 2L

Effects of Upland Drainage on Estuarine Nursery Areas of Pamlico Sound, North Carolina,
W82-02164 2L

Endangered Estuarine Receiving Waters: The Effects of Low-Flow Land Runoff on Headwaters Biota,
W82-02165 5C

Strategies for the Management of Estuaries,
W82-02166 6F

A Dynamic Methodology for Characterizing and Monitoring Estuarine Ecosystems,
W82-02167 7A

Variation in Life-History Patterns Between Intertidal and Subtidal Populations of the Meiobenthic Copepod Microarthridion Littorale,
W82-02560 2L

Large Vertical Salinity Gradients in the Ft. Pierce Inlet Associated with Hurricane David,
W82-02569 2L

ESTUARINE FISHERIES

The Effects of Freshwater Discharges on Sportfishing Catch Rates in the St. Lucie Estuary, Martin County, Florida,
W82-02124 6G

A New Approach to Determining the Quantitative Relationship Between Fishery Production and the Flow of Fresh Water to Estuaries,
W82-02130 4C

Texas Shrimp Fisheries and Freshwater Inflow,
W82-02131 6G

Management, Planning, and Organization in Initiating, Supporting and Coordinating an Ongoing Freshwater Diversion Project,
W82-02153 6B

Effects of Upland Drainage on Estuarine Nursery Areas of Pamlico Sound, North Carolina,
W82-02164 2L

Endangered Estuarine Receiving Waters: The Effects of Low-Flow Land Runoff on Headwaters Biota,
W82-02165 5C

ETHYLENE

Interactions Between Lugol's Fixative and Ethylene in the Acetylene-Reduction Assay for Nitrogenase Activity in Lake Water,
W82-02380 2K

EUROPE

The Effect of EEC Directives on Water Supplies,
W82-02432 6E

EUTROPHICATION

Freshwater Inputs and Estuarine Productivity,
W82-02110 2L

Phytoplankton Production and Community Composition in a Marsh-Dominated Estuary Which Receives Sewage Waste,
W82-02179 5C

Summer Internal Phosphorus Supplies in Shagawa Lake, Minnesota,
W82-02332 5B

Infrared Absorption Study of Humic Substances from Lake Apopka Sediment, Plankton and the Surrounding Drainage Basin,
W82-02348 2H

On the Trophic Status and Conservation of Kashmir Lakes,
W82-02412 5C

Growth of Mytilus Edulis in Net Bags Transferred to Different Localities in a Eutrophicated Danish Fjord,
W82-02428 5C

The Study of Phosphorus and Nitrogen Fluxes in Enriched Isolation Columns,
W82-02563 5C

EVAPOTRANSPIRATION

Evapotranspiration and Leaf Water Status of Alfalfa Growing Under Advective Conditions,
W82-02295 2D

Practical Prediction of Actual Evapotranspiration,
W82-02308 2D

EXPERIMENTAL DESIGN

Solar Heat Pond System,
W82-02187 3F

Model Experiments on the Growth of Enteric Bacteria in Fresh and Sea Water,
W82-02377 5A

FATE OF POLLUTANTS

Comparative Uptake of Actinides by Plants and Rats from the Shoreline of a Radioactive Pond,
W82-02323 5B

Evaluation of Water Quality During Herbicide Applications to Kerr Lake, OK,
W82-02327 5B

Multiport Diffuser Mixing Zones in Rivers,
W82-02594 5B

FEDERAL JURISDICTION

Review of Estuarine-Related Projects by the Gulf of Mexico Fishery Management Council,
W82-02146 6G

Assessment of the National Water Quality Management Program, Vol. I, 106 Program Overview, Planning and Standards.
W82-02181 6E

Assessment of the National Water Quality Management Program, Volume 3: Industrial and Municipal Control.
W82-02183 6E

Superfund: What a Mess,
W82-02184 6E

Compliance Strategy for Clean Water.
W82-02185 6E

FEDERAL WATER POLLUTION CONTROL ACT
Some Economic Impacts of Freshwater Stream Effluent Discharge Limits on Selected Small Communities in Mississippi,
W82-02530 5D

FENS
The Patterned Mires of the Red Lake Peatland, Northern Minnesota: Vegetation, Water Chemistry, and Landforms,
W82-02300 2H

FERTILIZERS
Nitrate-Nitrogen in Tile Drainage as Affected by Fertilization,
W82-02269 5B

FIELD TESTS
Relationship of the Roughness Coefficient Manning's N and Discharge in an Urban River,
W82-02376 2E

FINANCING
Adjusting Government Role in Water Law.
W82-02256 6E

Texas to Vote on Water Trust Fund.
W82-02302 6C

Appalachian Regional Commission and the Coastal Plains Regional Commission,
W82-02515 6E

FINITE ELEMENT METHOD
Subdomain Integration Model of Ground-Water Flow,
W82-02550 2F

FISH
Rainfall-Related Trends in the Structure of a Fish-Crustacean Community in Texas' Galveston Bay System,
W82-02160 2L

The Toxicity of 2,4-D to Cyprinus Carpio Var. Communis in Relation to the Seasonal Variation in the Temperature,
W82-02294 5C

Seasonal Variation in the Prevalence of 'Red Spot' Disease in Estuarine Fish with Particular Reference to the Sea Mullet, Mugil Cephalus L.,
W82-02426 2L

FISH BEHAVIOR
The Effects of Freshwater Discharges on Sportfishing Catch Rates in the St. Lucie Estuary, Martin County, Florida,
W82-02124 6G

FISH CREEK
Two Bed-Load Formulas: An Evaluation,
W82-02375 2J

FISH DISEASES
Seasonal Variation in the Prevalence of 'Red Spot' Disease in Estuarine Fish with Particular Reference to the Sea Mullet, Mugil Cephalus L.,
W82-02426 2L

FISH EGGS
Stream System Evaluation with Emphasis on Spawning Habitat for Salmonids,
W82-02552 7B

FISH MANAGEMENT
Review of Estuarine-Related Projects by the Gulf of Mexico Fishery Management Council,
W82-02146 6G

FISH POPULATIONS
Effects of Freshwater Flow on Fishery Resources in the Sacramento-San Joaquin Estuary,
W82-02141 4C

Liming Acid Ponds in New York,
W82-02572 5G

FISHERIES
Review of Estuarine-Related Projects by the Gulf of Mexico Fishery Management Council,
W82-02146 6G

Santee-Cooper Rediversion: Projected Impacts on Fishery Resources and Wildlife Habitats,
W82-02168 4A

FISHKILL
Mt. St. Helens and the Fish,
W82-02508 2J

FJORDS
Growth of Mytilus Edulis in Net Bags Transferred to Different Localities in a Eutrophicated Danish Fjord,
W82-02428 5C

Vertical Mixing Rates in Fjords Determined Using Radon and Salinity as Tracers,
W82-02576 2L

FLASH FLOODS
Flash Flood in Arizona - Observations and Their Application to the Identification of Flash-Flood Deposits in the Geologic Record,
W82-02350 2A

FLEXIBILITY
Flexible Outfall at Aldeburgh,
W82-02415 8A

FLOCCULATION
Optimizing Coagulants and Flocculant Aids for Settling,
W82-02409 5F

FLOOD CONTROL
Interactive Nonstructural Flood-Control Planning,
W82-02320 6F

Methods of Restoring the Delivery of Drainage Wells,
W82-02385 4A

Some Environmental Impacts of a Storm Surge Barrier,
W82-02417 6G

FLOOD DAMAGE
Bank Failure and Erosion on the Ohio River,
W82-02343 2J

Floods of March 1978 in the Maumee River Basin, Northeastern Indiana,
W82-02485 2E

FLOOD DATA
Rainfall-Runoff Modeling and Preliminary Regional Flood Characteristics of Small Rural Watersheds in the Arkansas River Basin in Colorado,
W82-02462 2A

Floods of March 1978 in the Maumee River Basin, Northeastern Indiana,
W82-02485 2E

FLOOD DISCHARGE
Preliminary Appraisal of Ephemeral-Streamflow Characteristics as Related to Drainage Area, Active-Channel Width, and Soils in Northwestern New Mexico,
W82-02476 2E

FLOOD FORECASTING
Estimates of the Magnitude of Glacier Outburst Floods from Lake Donjek, Yukon Territory, Canada,
W82-02241 2C

Preliminary Appraisal of Ephemeral-Streamflow Characteristics as Related to Drainage Area, Active-Channel Width, and Soils in Northwestern New Mexico,
W82-02476 2E

Developing Dam-Break Flood Zone Ordinance,
W82-02585 6F

FLOOD FREQUENCY
The Relative Influence of Dams and Secular Climatic Change on Downstream Flooding, Australia,

FOREBAYS
Membrane Liner Seals 278-Acre Reservoir.
W82-02361 8G

FOREST SOILS
Soil Moisture Use by Mixed Conifer Forest in a summer-Dry Climate,
W82-02558 2I

FORT PIERCE INLET
Large Vertical Salinity Gradients in the Ft. Pierce Inlet Associated with Hurricane David,
W82-02569 2L

FORT WAYNE
Floods of March 1978 in the Maumee River Basin, Northeastern Indiana,
W82-02485 2E

FOULING
Non-Acid Pretreatment and Management of Microorganisms in Seawater Desalination by Reverse Osmosis,
W82-02108 3A

FOUNDATION ROCKS
Geochemical Evidence on the Nature of the Basement Rocks of the Sierra Nevada, California,
W82-02460 2K

FRANCE
Origin of Isotopic and Geochemical Ratio Gradients in Karst Water of the Jura Mountains. (Sur L'Origine des Gradients de Teneurs Isotopiques et Geochimiques dans les eaux Karstiques du Jura (France)),
W82-02422 2F

Relationship Between Populations of Amphipods and Pollution,
W82-02444 5C

FREEZE PROCESS
Operating Characteristics of Various Combinations of Working Substances and Feeds in the Schroeder Desalting Process.
W82-02105 3A

FRESHWATER INFLOW
Monitoring Freshwater Inflow to Estuaries by Remote Sensing,
W82-02138 7A

FURROW IRRIGATION
A Management System for the Conjunctive Use of Rainfall and Limited Irrigation of Graded Furrows,
W82-02556 3F

FUTURE PLANNING
An Industrial View. Treatment Vis-A-Vis Discharge to Sewers,
W82-02407 6G

GATES
High-Head Vertical Lift Gates,
W82-02388 8A

GEOCHEMISTRY
Origin of Isotopic and Geochemical Ratio Gradients in Karst Water of the Jura Mountains. (Sur L'Origine des Gradients de Teneurs Isotopiques et Geochimiques dans les eaux Karstiques du Jura (France)),
W82-02422 2F

Geochemical Evidence on the Nature of the Basement Rocks of the Sierra Nevada, California,
W82-02460 2K

Limnological and Geochemical Survey of Williams Lake, Hubbard County, Minnesota,
W82-02471 2H

Geochemistry of Amino Acids in Sediments from Clear Lake, California,
W82-02545 2K

GEOHYDROLOGY
Selected Hydrogeologic Data from the Judith Basin, Central Montana,
W82-02490 7C

Assessment of Eighteen Public Groundwater Supplies in Illinois,
W82-02510 2F

Regional Hydrogeologic Concepts of Homoclinal Flanks,
W82-02548 2F

Induced Sinkholes: An Engineering Problem,
W82-02539 4B

GEOLOGIC FRACTURES
A Formula for Estimating Fissure Transmissivities from Steady-State Injection-Test Data,
W82-02292 8E

GEORGIA
Fate and Effects of a Heavy Fuel Oil Spill on a Georgia Salt Marsh,
W82-02358 5B

An Evaluation of the Potential for Water Conservation and Reuse in the Georgia Pulp and Paper Industry,
W82-02456 3E

Electron Intensity, the Role of Humic Acids in Extracellular Electron Transport and Chemical Determination of pE in Natural Waters,
W82-02566 2K

GEORGIA BIGHT
Benthic Enrichment in the Georgia Bight Related to Gulf Stream Intrusions and Estuarine Outwelling,
W82-02583 2L

GEOTHERMAL POWER
Geothermal Energy: An Old Ally,
W82-02333 2F

GEOTHERMAL RESOURCES
Environmental Control Technology Development for Geothermal Energy,
W82-02197 5C

Geothermally Powered Food-Processing Systems.
W82-02543 3E

GEOTHERMAL STUDIES
Effect of Cold Water Entry into a Liquid-Dominated Two-Phase Geothermal Reservoir,
W82-02314 2F

GILLETTE
42-Mile Water Pipeline for Coal Boom Town.
W82-02359 6D

GLACIAL LAKES
Estimates of the Magnitude of Glacier Outburst Floods from Lake Donjek, Yukon Territory, Canada,
W82-02241 2C

GLASGOW
Reducing Plumbosolvency - The Effect of Added Lime on the Loch Katrine Supply to Glasgow,
W82-02446 5F

GOVERNMENT FINANCE
Assessment of the National Water Quality Management Program, Volume 2: Construction Grants.
W82-02182 6E

GOVERNMENT INTERRELATIONS
Federal and State Coastal Zone Management Efforts Directed at Estuaries and Freshwater Inflow,
W82-02113 6E

GOVERNMENT SUPPORTS
Adjusting Government Role in Water Law.
W82-02256 6E

GRANTS
Assessment of the National Water Quality Management Program, Volume 2: Construction Grants.
W82-02182 6E

Appalachian Regional Commission and the Coastal Plains Regional Commission,
W82-02515 6E

GRASSES
Effects of Scheduling Municipal Waste-Water Effluent Irrigation of Reed Canarygrass on Nitrogen Renovation and Grass Production,
W82-02219 3C

GRAVEL
Cumulative Effects of Logging Road Sediment on Salmonid Populations in the Clearwater River, Jefferson County, Washington,
W82-02507 2J

Characterization of Spawning Gravel and Stream System Evaluation,
W82-02509 2J

GREAT BRITAIN
The Use of Mathematical Modelling as a Decision-Making Tool in the Water Authorities of England and Wales for Water-Quality Management,
W82-02424 6A

The Importance of Drift Deposit Influences on the Hydrogeology of Major British Aquifers,
W82-02437 2F

GREENHOUSES
Solar Heat Pond System,
W82-02187 3F

GREENSBORO
Water Conservation Program of the City of Greensboro,
W82-02518 3D

GROUNDWATER
Groundwater Quality in the Severn-Trent Region,
W82-02423 5A

The Importance of Drift Deposit Influences on the Hydrogeology of Major British Aquifers,
W82-02437 2F

Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1981,
W82-02459 2F

Impact of Suburban Residential Development on Water Resources in the Area of Winslow Township, Camden County, New Jersey,
W82-02461 4C

Current Water-Resources Investigations of the U.S. Geological Survey in North Dakota--Fiscal Year 1981.
W82-02463 7C

Potentiometric Surface of the Floridan Aquifer, Southwest Florida Water Management District, May 1981,
W82-02464 7C

Water Levels in Bedrock Aquifers in South Dakota,
W82-02466 2F

Ground-Water Data for Michigan 1980,
W82-02467 2F

Chemical Quality of Ground Water in San Joaquin and Part of Contra Costa Counties, California,
W82-02470 2K

Water-Resources Information for the Withlacoochee River Region, West-Central Florida,
W82-02473 6B

Water Resources Data for Utah, Water Year 1979.
W82-02474 7C

Hydrologic Maps of Ogallala Aquifer, West-Central Kansas,
W82-02475 7C

Potentiometric Surface of the Floridan Aquifer, St. John's River Water Management District and Vicinity, Florida, May 1981,
W82-02479 7C

Water Resources of the Kisatchie Well-Field Area Near Alexandria, Louisiana,
W82-02480 7C

Ground-Water-Level Monitoring Network, Hollister and San Juan Valleys, San Benito County, California,
W82-02487 7A

Water-Resources Investigations of the U.S. Geological Survey in Missouri--Fiscal Year 1981.
W82-02488 7C

Selected Hydrogeologic Data from the Judith Basin, Central Montana,
W82-02490 7C

Water Resources Data for Indiana, Water Year 1980.
W82-02492 7C

Water Resources Data for Florida, Water Year 1980--Volume 4. Northwest Florida.
W82-02493 7C

Water Resources Data for Pennsylvania, Water Year 1980--Volume 3. Ohio River and St. Lawrence River Basins.
W82-02494 7C

Water Resources Data for Wyoming, Water Year 1980--Volume 2. Green River Basin, Bear River Basin, and Snake River Basin.
W82-02495 7C

Water Resources Data for Minnesota, Water Year 1980--Volume 1. Great Lakes and Souris-Red-Rainy River Basins.
W82-02496 7C

Water Resources Data for Minnesota, Water Year 1980--Volume 2. Upper Mississippi and Missouri River Basins.
W82-02497 7C

Water Resources Data for New Mexico, Water Year 1980.
W82-02498 7C

Water Resources Data for Kentucky, Water Year 1979.
W82-02499 7C

Hydrologic Reconnaissance of the Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W82-02500 7C

Methods for Treatment of Color in Groundwater,
W82-02532 5F

Ground Water in Washington,
W82-02536 2F

Investigations of High Groundwater in Polson Terminal Moraine,
W82-02538 2F

Subdomain Integration Model of Ground-Water Flow,
W82-02550 2F

GROUNDWATER AVAILABILITY
Desalting Demonstration Plant Feasibility Study at Laguna Pueblo, New Mexico.
W82-02104 3A

The Availability of Ground Water in Western Montgomery County, Maryland,
W82-02481 2F

GROUNDWATER MANAGEMENT

Waterlogging Control for Improved Water and Land Use Efficiencies: A Systematic Analysis,
W82-02455 6A

Hydrologic Maps of Ogallala Aquifer, West-Central Kansas,
W82-02475 7C

Reasonable Groundwater Pumping Levels Under the Appropriation Doctrine: The Law and Underlying Economic Goals,
W82-02503 6E

Efficient Groundwater Utilization,
W82-02520 6D

Management of Interstate Aquifer Systems,
W82-02578 4B

GROUNDWATER MINING

Public Perception of Groundwater Depletion in Southwestern Kansas,
W82-02174 3F

GROUNDWATER MOVEMENT

The Ground Water Flow System in the Vicinity of Marco Island, Florida,
W82-02123 2F

Aquifer Response Due to Zones of Higher Permeability and Storage Coefficient,
W82-02190 2F

A Two-Dimensional Finite-Element Solution Scheme for the Saturated-Unsaturated Flow with Applications to Flow Through Ditch-Drained Soils,
W82-02283 2F

Chemistry of Interstitial Water and Bottom Sediments as Indicators of Seepage Patterns in Perch Lake, Chalk River, Ontario,
W82-02304 2A

Unsteady Free Flow to a Ditch from an Artesian Aquifer,
W82-02369 2F

Investigations of High Groundwater in Polson Terminal Moraine,
W82-02538 2F

Regional Hydrogeologic Concepts of Homoclinal Flanks,
W82-02548 2F

The Use of Ground-Water Flow Models for Estimating Lake Seepage Rates,
W82-02549 2F

GROUNDWATER POLLUTION

Transport and Fate of Selected Organic Pollutants in a Sandy Soil,
W82-02220 5B

PVC Cover Causes Leachate Retreat,
W82-02321 5E

The Effects of Rapid Infiltration of Municipal Wastewater on Groundwater Quality,
W82-02537 5B

Comparison of Groundwater and Surface Water for Patterns and Levels of Contamination by Toxic Substances,
W82-02541 5A

GROUNDWATER POTENTIAL

Proceedings and Recommendations of the Workshop on Groundwater Problems in the Ohio River Basin, April 28-29, 1981. Cincinnati, Ohio.
W82-02106 2F

GROWTH KINETICS

The Effect of Environmental Factors on Phytoplankton Growth: Temperature and the Interactions of Temperature with Nutrient Limitation,
W82-02221 2H

The Effect of Environmental Factors on Phytoplankton Growth: Light and the Interactions of Light with Nitrate Limitation,
W82-02331 2H

GROWTH STAGES

Freshwater Influences on Striped Bass Population Dynamics,
W82-02116 6G

GULF OF ALASKA

Major- and Trace-Element Composition of Suspended Matter in the North-East Gulf of Alaska: Relationships with Major Sources,
W82-02259 5B

GULF OF MEXICO

Review of Estuarine-Related Projects by the Gulf of Mexico Fishery Management Council,
W82-02146 6G

GULFS

Major- and Trace-Element Composition of Suspended Matter in the North-East Gulf of Alaska: Relationships with Major Sources,
W82-02259 5B

HABITATS

Effects of Wetland Changes on the Fish and Wildlife Resources of Coastal Louisiana,
W82-02129 4C

Effects of Upland Drainage on Estuarine Nursery Areas of Pamlico Sound, North Carolina,
W82-02164 2L

HALOGENS

The Effect of pH and Halogens on the Stability of Reverse Osmosis Membranes,
W82-02188 5D

HAMILTON HARBOR

Some Measurements on Near Surface Turbulence in the Depth Direction and Some Phytoplankton Distribution Implications,
W82-02227 7B

HANDBOOKS

Water Resources Protection Measures in Land Development - A Handbook - Revised Edition,
W82-02453 4D

HARBORS

Some Measurements on Near Surface Turbulence in the Depth Direction and Some Phytoplankton Distribution Implications,
W82-02227 7B

HAZARDOUS MATERIALS

Superfund: What a Mess,
W82-02184 6E

Managing Hazardous Wastes,
W82-02252 5E

HEATED WATER

Solar Heat Pond System,
W82-02187 3F

Geothermally Powered Food-Processing Systems.
W82-02543 3E

HEAVY METALS

Heavy Metals and Marine Phytoplankton: Correlation of Toxicity and Sulfhydryl-Binding,
W82-02272 5C

Heavy Metals in River Sediments - Calculation of Metal Adsorption Maxima Using Langmuir and Freundlich Isotherms,
W82-02290 5B

Accumulation of Heavy Metals in Arid-Zone Soils Irrigated with Treated Sewage Effluents and Their Uptake by Rhodes Grass,
W82-02392 5B

Cadmium, Copper, Lead, Zinc and Manganese in the Polychaete Arenicola Marina from Sediments Around the Coast of Wales,
W82-02416 5A

HERBICIDES

The Toxicity of 2,4-D to Cyprinus Carpio Var. Communis in Relation to the Seasonal Variation in the Temperature,
W82-02294 5C

Control of Aquatic Weeds with Hexazinone,
W82-02326 4A

Evaluation of Water Quality During Herbicide Applications to Kerr Lake, OK,
W82-02327 5B

Diquat and Sodium Alginate for Weed Control in Rivers,
W82-02328 4A

Preliminary Evaluation of Hydrogen Peroxide as a Potential Herbicide for Aquatic Weeds,
W82-02329 4A

Relationships Between Pond Sediments and Simazine Loss from Waters of Laboratory Systems,
W82-02330 5B

HEXAZINONE

Control of Aquatic Weeds with Hexazinone,
W82-02326 4A

HIGHWAY EFFECTS

Use of Horizontal Drains: Case Histories from the Colorado Division of Highways,
W82-02211 8A

Long Term Performance of Horizontal Drains,
W82-02212 8A

Mississippi's Experience with Horizontally Drilled Drains and Conduits in Soil,
W82-02213 8A

Rockwood Embankment Slide Between Stations 2001+00 and 2018+00: A Horizontal Drain Case History,
W82-02214 8A

HIGHWAYS

Composite Sampling of Highway Runoff,
W82-02230 7B

HILLSBOROUGH

Water Savings in the Orange Water and Sewer Authority,
W82-02519 3D

HISTORY

130,000-Yr Continuous Pollen Record from Clear Lake, Lake County, California,
W82-02544 2K

HOLLAND

Some Environmental Impacts of a Storm Surge Barrier,
W82-02417 6G

HOMOCLINAL FLANKS

Regional Hydrogeologic Concepts of Homoclinal Flanks,
W82-02548 2F

HOMOGENEITY

Thermal Convection in a Nonhomogeneous Aquifer,
W82-02288 2F

HOUSATONIC RIVER
PCBs in the Housatonic River: Determination and Distribution,
W82-02255 5A

HUDSON RIVER ESTUARY
Effects of Freshwater Flow on Salinity and Phytoplankton Biomass in the Lower Hudson Estuary,
W82-02117 2L

HUMAN DISEASES
Environmental Repercussions of Irrigation Development in Hot Climates,
W82-02366 6G

Waterborne Disease Is Prevalent in Egypt,
W82-02435 5C

HUMAN POPULATION
History of Human-Use Impacts on Long Point Bay,
W82-02580 5B

HUMIC ACIDS
Dissolved Humic Substances: A Major Source of Error in Fluorometric Analyses Involving Lake Waters,
W82-02223 5A

The Effect of Aquatic Humus on the Biological Availability of Cadmium,
W82-02353 5C

Electron Intensity, the Role of Humic Acids in Extracellular Electron Transport and Chemical Determination of pE in Natural Waters,
W82-02566 2K

HURRICANES
Large Vertical Salinity Gradients in the Ft. Pierce Inlet Associated with Hurricane David,
W82-02569 2L

HYDRA
Summer Population Fluctuations, Feeding, and Growth of Hydra in an Arctic Lake,
W82-02287 2H

HYDRAULIC CONDUCTIVITY
A Formula for Estimating Fissure Transmissivities from Steady-State Injection-Test Data,
W82-02292 8E

The Use of Ground-Water Flow Models for Estimating Lake Seepage Rates,
W82-02549 2F

HYDRAULIC GATES
Hydraulic Gates,
W82-02206 8C

HYDRAULIC PERMEABILITY
Relationship of Electrical Dispersion to Soil Properties,
W82-02561 8D

HYDROCARBONS
The Early Diagenesis of Aliphatic Hydrocarbons and Organic Matter in Sedimentary Particulates from Debob Bay, Washington,
W82-02310 5B

HYDROELECTRIC PLANTS
Hydropower: Untapped Resource and Environmental Hazard,
W82-02277 5C

Membrane Liner Seals 278-Acre Reservoir.
W82-02361 8G

High-Head Vertical Lift Gates,
W82-02388 8A

HYDROGEN ION CONCENTRATION
The Effect of pH and Halogens on the Stability of Reverse Osmosis Membranes,
W82-02188 5D

Chemical Availability of Cadmium in Mississippi River Sediment,
W82-02267 5B

Effects of pH, Phosphate, and Ammonia on the Rate of Uptake of Nitrate and Ammonia by Freshwater Phytoplankton,
W82-02398 5C

pH Correction: Technical Aspects of a 500 TCMD Treatment Works,
W82-02447 5F

HYDROGEN PEROXIDE
Preliminary Evaluation of Hydrogen Peroxide as a Potential Herbicide for Aquatic Weeds,
W82-02329 4A

HYDROGENATION
Comparison of Metals as Catalysts for the Photolysis of Water,
W82-02527 5G

HYDROGEOLOGY
The Importance of Drift Deposit Influences on the Hydrogeology of Major British Aquifers,
W82-02437 2F

HYDROGRAPHS
Water Routing on Diverging-Converging Watersheds,
W82-02200 2A

HYDROLOGIC BUDGET
Water Budget and Projected Water Quality in Proposed Man-Made Lakes Near Estuaries in the Marco Island Area, Florida,
W82-02122 5B

The Impact of Urbanization on Seasonal Hydrologic and Nutrient Budgets of a Small North American Watershed,
W82-02400 5B

The Availability of Ground Water in Western Montgomery County, Maryland,
W82-02481 2F

HYDROLOGIC DATA
Water Resources Data for Utah, Water Year 1979.
W82-02474 7C

Water Resources Data for Indiana, Water Year 1980.
W82-02492 7C

Water Resources Data for Florida, Water Year 1980–Volume 4. Northwest Florida.

Desalting Demonstration Plant Feasibility Study at Laguna Pueblo, New Mexico,
W82-02104 3A

Draft Environmental Assessment Desalting Demonstration Plant, Laguna, New Mexico,
W82-02171 3A

Do State Water Anti-Exportation Statutes Violate the Commerce Clause. Or Will New Mexico's Embargo Law Hold Water,
W82-02279 6E

Simulation of an Aquifer Test on the Tesuque Pueblo Grant, New Mexico,
W82-02465 2F

Preliminary Appraisal of Ephemeral-Streamflow Characteristics as Related to Drainage Area, Active-Channel Width, and Soils in Northwestern New Mexico,
W82-02476 2E

Water Resources Data for New Mexico, Water Year 1980,
W82-02498 7C

NEW YORK
Two Bed-Load Formulas: An Evaluation,
W82-02375 2J

Hydraulic Analysis of Chenango River, Broome County, New York, in Relation to State Highway Plan,
W82-02477 4C

Flood of November 26-27, 1979, in Essex County, New York,
W82-02483 2E

Liming Acid Ponds in New York,
W82-02572 5G

NEW YORK BIGHT
Nitrate and Ammonia Uptake in the Apex of the New York Bight,
W82-02286 5C

NEW ZEALAND
Water for New Zealand's Plains,
W82-02402 3F

Diel Changes in Plankton and Water Chemistry in Wicken Brickpit,
W82-02411 2H

NITRATES
Nitrate-Nitrogen in Tile Drainage as Affected by Fertilization,
W82-02269 5B

Nitrate and Ammonia Uptake in the Apex of the New York Bight,
W82-02286 5C

Effect of Drainage System Design and Operation on Nitrate Transport,
W82-02505 5B

NITRIFICATION
Coupled Trickling Filter-Rotating Biological Contactor Nitrification Process,
W82-02315 5D

The Effect of Nitrification in the BOD Test,
W82-02384 5D

NITROGEN
Effects of pH, Phosphate, and Ammonia on the Rate of Uptake of Nitrate and Ammonia by Freshwater Phytoplankton,
W82-02398 5C

NITROGEN COMPOUNDS
Economic Impact of Existing Ammonia Nitrogen Water Quality Standard, IPCB Chapter 3, Rule 203 (F),
W82-02189 5D

NITROGEN FIXING BACTERIA
Algal-Bacterial Symbiosis in the Chowan River, NC,
W82-02177 5A

NITROGEN REMOVAL
Effects of Scheduling Municipal Waste-Water Effluent Irrigation of Reed Canarygrass on Nitrogen Renovation and Grass Production,
W82-02219 3C

NITROUS OXIDE
Nitrous Oxide Concentrations in Lakes: Variations with Depth and Time,
W82-02553 2H

NONHOMOGENEOUS AQUIFERS
Thermal Convection in a Nonhomogeneous Aquifer,
W82-02288 2F

NONPOINT POLLUTION SOURCES
Assessment Methodologies for Freshwater Inflows to Chesapeake Bay,
W82-02118 5B

A Method for Obtaining Slope Information for Hydrologic Models,
W82-02364 2A

Simulation Model for Agricultural Non-Point-Source Pollution,
W82-02504 5B

NORTH CAROLINA
Trihalomethane Formation in North Carolina Drinking Waters,
W82-02195 5B

Wastewater Management in Coastal North Carolina,
W82-02511 5D

Municipal Needs,
W82-02513 6E

Recycling,
W82-02514 6E

Appalachian Regional Commission and the Coastal Plains Regional Commission,
W82-02515 6E

Trends in State and Federal Policy on Water Supply Management,
W82-02516 6E

Efficient Groundwater Utilization,
W82-02520 6D

New Developments in Water Resources Management for Local Governments and Industries,
W82-02522 6E

NORTH DAKOTA
Current Water-Resources Investigations of the U.S. Geological Survey in North Dakota--Fiscal Year 1981,
W82-02463 7C

NORTHWEST FLORIDA
Water Resources Data for Florida, Water Year 1980--Volume 4. Northwest Florida,
W82-02493 7C

NUTRIENT REMOVAL
Reducing Ground-Water Pollution from Municipal Waste-Water Irrigation of Rhodes Grass Grown on Sand Dunes,
W82-02391 3C

Concepts in Aquatic Treatment System Design,
W82-02593 5D

NUTRIENT REQUIREMENTS
The Effect of Environmental Factors on Phytoplankton Growth: Temperature and the Interactions of Temperature with Nutrient Limitation,
W82-02221 2H

The Effect of Environmental Factors on Phytoplankton Growth: Light and the Interactions of Light with Nitrate Limitation,
W82-02331 2H

NUTRIENTS
Freshwater Inputs and Estuarine Productivity,
W82-02110 2L

Water Budget and Projected Water Quality in Proposed Man-Made Lakes Near Estuaries in the Marco Island Area, Florida,
W82-02122 5B

A New Approach to Determining the Quantitative Relationship Between Fishery Production and the Flow of Fresh Water to Estuaries,
W82-02130 4C

Nutrient Flux Between the Nueces Deltaic Marsh and the Nueces Estuary on the Texas Gulf Coast,
W82-02134 2L

The Influence of Salinity Transition on Benthic Nutrient Regeneration in Estuaries,
W82-02137 2L

The Nutritional Significance of the Distribution of Suspended Particulate Material in the Upper San-Francisco Bay-Estuary,
W82-02140 2L

Historical Overview of the Freshwater Inflow and Sewage Treatment Plant Discharges to the Potomac River Estuary with Resultant Nutrient and Water Quality Trends,
W82-02161 5C

Endangered Estuarine Receiving Waters: The Effects of Low-Flow Land Runoff on Headwaters Biota,
W82-02165 5C

Physical and Geochemical Characteristics of Suspended Solids, Wilton Creek, Ontario,
W82-02236 5B

Nutrient and Sediment Loadings from a Subsurface Drainage System,
W82-02266 5B

Enumeration of Heterotrophic Bacteria in River Waters by Using a Low Nutrient Medium (In Japanese),
W82-02352 5A

Simulation of Nutrient Balances in a Shallow and Polluted River: A Strategy for Environmental Control,
W82-02354 5B

Trophic Changes Without Changes in the External Nutrient Loading,
W82-02367 2H

The Impact of Urbanization on Seasonal Hydrologic and Nutrient Budgets of a Small North American Watershed,
W82-02400 5B

Diel Changes in Plankton and Water Chemistry in Wicken Brickpit,
W82-02411 2H

Simulation Model for Agricultural Non-Point-Source Pollution,
W82-02504 5B

Photosynthetic Pigments as Indicators of Algal Activity in the Upper Potomac Estuary,
W82-02529 5B

The Study of Phosphorus and Nitrogen Fluxes in Enriched Isolation Columns,
W82-02563 5C

Nutrient Contents of Precipitation and Canopy Throughfall Under Corn, Soybeans, and Oats,
W82-02574 2I

Benthic Enrichment in the Georgia Bight Related to Gulf Stream Intrusions and Estuarine Outwelling,
W82-02583 2L

OCEAN DUMPING
Sludge: Back into the Ocean,
W82-02577 5E

OGALLALA AQUIFER
Public Perception of Groundwater Depletion in Southwestern Kansas,
W82-02174 3F

OHIO RIVER
Bank Failure and Erosion on the Ohio River,
W82-02343 2J

OHIO RIVER BASIN
Proceedings and Recommendations of the Workshop on Groundwater Problems in the Ohio River Basin, April 28-29, 1981. Cincinnati, Ohio.
W82-02106 2F

OIL AND GAS PRODUCTION
Water Law, Water Conservation and the Development of Energy Resources in the Coastal, Offshore and Flood Plain Areas of Alabama,
W82-02535 5G

OIL POLLUTION
Characterization of Oil Spills on Inland and Estuarine Waters,
W82-02393 5B

OIL SPILLS
Fate and Effects of a Heavy Fuel Oil Spill on a Georgia Salt Marsh,
W82-02358 5B

Characterization of Oil Spills on Inland and Estuarine Waters,
W82-02393 5B

OIL-WATER INTERFACES
Characterization of Oil Spills on Inland and Estuarine Waters,
W82-02393 5B

OKLAHOMA
Effects of pH, Phosphate, and Ammonia on the Rate of Uptake of Nitrate and Ammonia by Freshwater Phytoplankton,
W82-02398 5C

OLIGOCHAETES
Effect of the Earthworm, Eisenia Foetida (Oligochaeta), on Fluxes of Volatile Carbon and Sulfur Compounds from Sewage Sludge,
W82-02362 5E

Enchytraeid Oligochaetes as Marine Pollution Indicators,
W82-02445 5A

OLIGOTROPHIC LAKES
Factors Contributing to the Maintenance of Oligotrophy in an Alpine Glacial Moraine Lake (Wallowa Lake) in Northeast Oregon,
W82-02250 2H

Trophic Changes Without Changes in the External Nutrient Loading,
W82-02367 2H

ONTARIO
The Economic Significance of the Long Point Marsh, Lake Erie, as a Recreational Resource,
W82-02229 6B

Physical and Geochemical Characteristics of Suspended Solids, Wilton Creek, Ontario,
W82-02236 5B

Surface Water Hydrologic Criteria for Uranium Mine Tailings Impoundments in Ontario,
W82-02240 5E

Stream Phosphorus Exports from Watersheds with Contrasting Land Uses in Southern Ontario,
W82-02251 5B

Hypolimnetic Aeration of a Small Eutrophic Kettle Lake: Physical and Chemical Changes,
W82-02341 5G

Major Physical Features of Long Point Bay and Its Watershed,
W82-02579 2H

History of Human-Use Impacts on Long Point Bay,
W82-02580 5B

OPEN-CHANNEL FLOW
Possibility of Investigating Open-Channel Flows on an Analog Computer,
W82-02389 6A

Velocity Profiles with Suspended Sediment,
W82-02581 2J

OPERATING POLICIES
The Effect of EEC Directives on Water Supplies,
W82-02432 6E

Operation Policy Analysis: Sam Rayburn Reservoir,
W82-02589 6A

ORANGE COUNTY WATER DISTRICT
Evaluation of Membrane Processes and Their Role in Wastewater Reclamation: Volume II,
W82-02457 5D

ORDINANCES
Developing Dam-Break Flood Zone Ordinance,
W82-02585 6F

OREGON
Factors Contributing to the Maintenance of Oligotrophy in an Alpine Glacial Moraine Lake (Wallowa Lake) in Northeast Oregon,
W82-02250 2H

Energy Costs and Portland Water Supply System,
W82-02586 5F

ORGANIC CARBON
Determination of Dissolved Organic Carbon in Water,
W82-02194 5A

Pathways and Mechanisms for Removal of Dissolved Organic Carbon from Leaf Leachate in Streams,
W82-02222 5B

ORGANIC COMPOUNDS
Transport and Fate of Selected Organic Pollutants in a Sandy Soil,
W82-02220 5B

Specific Organic Removals by Granular Activated Carbon Pilot Contactors,
W82-02260 5F

ORGANIC MATTER
The Downstream Transport of Fine Material and the Organic Matter Balance for a Section of a Small Chalk Stream in Southern England,
W82-02192 1B

Seasonal Evaluation of Organics Removal at a Conventional Water Treatment Plant,
W82-02248 5F

Composition and Vertical Flux of Organic Matter in a Large Alaskan Estuary,
W82-02347 2L

ORGANIC PESTICIDES
Kepone Distribution in the Water Column of the James River Estuary - 1976-78,
W82-02360 5B

ORGANIZATION IDENTIFICATION CODE
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W82-02486 10D

ORGANIZATIONS
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W82-02486 10D

OUTFALL SEWERS
Sewage Outfall Location Reduces Environmental Damage in the Thames Estuary,
W82-02404 5G

Flexible Outfall at Aldeburgh,
W82-02415 8A

OUTFALLS
The Design of Sea Outfalls with Reference to EEC Amenity Water Pollution Criteria,
W82-02449 5E

OVERLAND FLOW
Water Routing on Diverging-Converging Watersheds,
W82-02200 2A

OXIDATION-REDUCTION POTENTIAL
Chemical Availability of Cadmium in Mississippi River Sediment,
W82-02267 5B

Electron Intensity, the Role of Humic Acids in Extracellular Electron Transport and Chemical Determination of pE in Natural Waters,
W82-02566 2K

PACIFIC NORTHWEST
Aerial Photography to Detect Rill Erosion,
W82-02232 7B

Characterization of Spawning Gravel and Stream System Evaluation,
W82-02509 2J

PALEOENVIRONMENT
Delineation of Acid Mine Drainage Potential of Coal-Bearing Strata of the Pottsville and Allegheny Groups in Western Pennsylvania,
W82-02534 6A

PARTIAL DIVERSION
Santee-Cooper Rediversion: Projected Impacts on Fishery Resources and Wildlife Habitats,
W82-02168 4A

PARTICLE SIZE
Sediment Transport in the Tanana River Near Fairbanks, Alaska, 1977-79,
W82-02472 2J

PATH OF POLLUTANTS
Viral Transport to Ground Water at a Wastewater Land Application Site,
W82-02317 3C

Spatial and Temporal Variation of Fecal Coliform Movement Surrounding Septic Tank-Soil Absorption Systems in Two Atlantic Coastal Plain Soils,
W82-02325 5B

The Seasonal Variation in Silicon Concentration in Chalk-Streams in Relation to Diatom Growth,
W82-02439 5B

Delineation of Acid Mine Drainage Potential of Coal-Bearing Strata of the Pottsville and Allegheny Groups in Western Pennsylvania,
W82-02534 6A

Discussion of Trace Metals in the Waters of a Partially-Mixed Estuary,
W82-02542 2L

PEACH
Diurnal Variation in Water Potential Components and Stomatal Resistance of Irrigated Peach Seedlings,
W82-02202 2I

PEAT BOGS
The Patterned Mires of the Red Lake Peatland, Northern Minnesota: Vegetation, Water Chemistry, and Landforms,
W82-02300 2H

PECONIC BAY ESTUARY
Seasonal Variation of Vitamin B12, B12 Analogs, and Phytoplankton in a Long Island Estuary,
W82-02282 2L

PENNSYLVANIA
Water Resources Data for Pennsylvania, Water Year 1980--Volume 3. Ohio River and St. Lawrence River Basins.
W82-02494 7C

Delineation of Acid Mine Drainage Potential of Coal-Bearing Strata of the Pottsville and Allegheny Groups in Western Pennsylvania,
W82-02534 6A

PERCH
Endangered Estuarine Receiving Waters: The Effects of Low-Flow Land Runoff on Headwaters Biota,
W82-02165 5C

PERCH LAKE
Chemistry of Interstitial Water and Bottom Sediments as Indicators of Seepage Patterns in Perch Lake, Chalk River, Ontario,
W82-02304 2A

PERFORMANCE EVALUATION
Ski-Jump Spillway for India's Ukai Dam,
W82-02430 8A

PERIPHYTON
Periphyton Production in an Appalachian Mountain Trout Stream,
W82-02335 5C

PERMAFROST
Climatic Relationships of Permafrost Zones in Areas of Low Winter Snow-Cover,
W82-02239 2C

PERMEABILITY
Aquifer Response Due to Zones of Higher Permeability and Storage Coefficient,
W82-02190 2F

Water Resources of the Kisatchie Well-Field Area Near Alexandria, Louisiana,
W82-02480 7C

PERMEABILITY COEFFICIENT
A Formula for Estimating Fissure Transmissivities from Steady-State Injection-Test Data,
W82-02292 8E

PERMETHRIN
Permethrin Concentration on Cotton Plants, Persistence in Soil, and Loss in Runoff,
W82-02322 5B

PHOSPHORUS
Stream Phosphorus Exports from Watersheds with Contrasting Land Uses in Southern Ontario,
W82-02251 5B

Summer Internal Phosphorus Supplies in Shagawa Lake, Minnesota,
W82-02332 5B

PHOSPHORUS REMOVAL
Phosphorus Removal by Activated Alumina,
W82-02313 5D

Summer Reaeration and Winter Ice Removal from Lakes and Reservoirs,
W82-02526 2H

PHOTOLYSIS
Comparison of Metals as Catalysts for the Photolysis of Water,
W82-02527 5G

PHOTOPLANKTON
Photosynthetic Pigments as Indicators of Algal Activity in the Upper Potomac Estuary,
W82-02529 5B

PHOTOSYNTHESIS
Growth and Photosynthesis of Najas Marina L. as Affected by Light Intensity,
W82-02365 4A

PHYSICAL PROPERTIES
Major Physical Features of Long Point Bay and Its Watershed,
W82-02579 2H

PHYSICOCHEMICAL TREATMENT
Determining Maximum Influent Concentrations of Priority Pollutants for Treatment Plants,
W82-02307 5A

PHYTOPLANKTON
Effects of Freshwater Flow on Salinity and Phytoplankton Biomass in the Lower Hudson Estuary,
W82-02117 2L

Phytoplankton Production and Community Composition in a Marsh-Dominated Estuary Which Receives Sewage Waste,
W82-02179 5C

The Effect of Environmental Factors on Phytoplankton Growth: Temperature and the Interactions of Temperature with Nutrient Limitation,
W82-02221 2H

Some Measurements on Near Surface Turbulence in the Depth Direction and Some Phytoplankton Distribution Implications,
W82-02227 7B

Heavy Metals and Marine Phytoplankton: Correlation of Toxicity and Sulfhydryl-Binding,
W82-02272 5C

Seasonal Variation of Vitamin B12, B12 Analogs, and Phytoplankton in a Long Island Estuary,
W82-02282 2L

The Effect of Environmental Factors on Phytoplankton Growth: Light and the Interactions of Light with Nitrate Limitation,
W82-02331 2H

Interactions Between Lugol's Fixative and Ethylene in the Acetylene-Reduction Assay for Nitrogenase Activity in Lake Water,
W82-02380 2K

Effects of pH, Phosphate, and Ammonia on the Rate of Uptake of Nitrate and Ammonia by Freshwater Phytoplankton,
W82-02398 5C

PIEZOMETRIC HEAD
Subdomain Integration Model of Ground-Water Flow,
W82-02550 2F

PIPELINES
42-Mile Water Pipeline for Coal Boom Town.
W82-02359 6D

The Integrity of Existing Distribution Systems,
W82-02450 5F

PIPES
Long Term Performance of Horizontal Drains,
W82-02212 8A

Horizontal Drains and Horizontal Drilling: An Overview,
W82-02215 8A

Flexible Outfall at Aldeburgh,
W82-02415 8A

Reducing Plumbosolvency - The Effect of Added Lime on the Loch Katrine Supply to Glasgow,
W82-02446 5F

PIT RECHARGE
Treated Pit Fluids Meet Water Specifications.
W82-02557 5E

PLANKTON
Metabolism of a Florida Lake Ecosystem,
W82-02268 2H

Infrared Absorption Study of Humic Substances from Lake Apopka Sediment, Plankton and the Surrounding Drainage Basin,
W82-02348 2H

Bioassays of Waters from the Severn and Thames River Systems,
W82-02448 5A

The Physico-Chemical and Planktonic Response of an Algicide-Treated Shallow Mountain Lake in Arizona,
W82-02571 5G

PLANNING
Values of Ecological Characterization Studies to Assess Effects of Freshwater Inflow to Estuaries,
W82-02147 6G

Management, Planning, and Organization in Initiating, Supporting and Coordinating an Ongoing Freshwater Diversion Project,
W82-02153 6B

PLANT GROWTH
Growth and Photosynthesis of Najas Marina L. as Affected by Light Intensity,
W82-02365 4A

PLASTICS
Membrane Liner Seals 278-Acre Reservoir.
W82-02361 8G

POLICY MAKING
Decision-Making Constraints in the Policy Development and Administration of Water Resources in West Virginia,
W82-02173 6E

Disposal of Industrial Effluents - Some Future Problems,
W82-02405 5D

An Industrial View. Treatment Vis-A-Vis Discharge to Sewers,
W82-02407 6G

POLITICAL ASPECTS
Assessment of the National Water Quality Management Program, Volume 3: Industrial and Municipal Control.
W82-02183 6E

POLITICAL CONSTRAINTS
Decision-Making Constraints in the Policy Development and Administration of Water Resources in West Virginia,
W82-02173 6E

POLLEN
130,000-Yr Continuous Pollen Record from Clear Lake, Lake County, California,
W82-02544 2K

Geochemistry of Amino Acids in Sediments from Clear Lake, California,
W82-02545 2K

POLLUTANT IDENTIFICATION
Development of Immunoenzymatic Methods for Detection and Quantitation of Poliovirus,
W82-02176 5A

Determination of 2,4-Dichlorophenoxyacetic Acid and Silvex in Water with High-Performance Liquid Chromatography,
W82-02298 5A

Determining Maximum Influent Concentrations of Priority Pollutants for Treatment Plants,
W82-02307 5A

A Close-Interval Sampler for Collection of Sediment Pore Waters for Nutrient Analyses,
W82-02346 5A

Cadmium, Copper, Lead, Zinc and Manganese in the Polychaete Arenicola Marina from Sediments Around the Coast of Wales,
W82-02416 5A

Aquatic Biology of the Redwood Creek and Mill Creek Drainage Basins, Redwood National Park, Humboldt and Del Norte Counties, California,
W82-02484 4C

Water-Quality Reconnaissance of the Larkin Creek Watershed, Lee and St. Francis Counties, Arkansas,
W82-02489 5A

POLLUTANTS
Biodegradability Studies with Organic Priority Pollutant Compounds,
W82-02231 5D

Enchytraeid Oligochaetes as Marine Pollution Indicators,
W82-02445 5A

POLLUTION ABATEMENT
Some Economic Impacts of Freshwater Stream Effluent Discharge Limits on Selected Small Communities in Mississippi,
W82-02530 5D

POLLUTION LOAD
Historical Overview of the Freshwater Inflow and Sewage Treatment Plant Discharges to the Potomac River Estuary with Resultant Nutrient and Water Quality Trends,
W82-02161 5C

POLSON MORAINE
Investigations of High Groundwater in Polson Terminal Moraine,
W82-02538 2F

POLYCHAETES
Cadmium, Copper, Lead, Zinc and Manganese in the Polychaete Arenicola Marina from Sediments Around the Coast of Wales,
W82-02416 5A

POLYCHLORINATED BIPHENYLS
PCBs in the Housatonic River: Determination and Distribution,
W82-02255 5A

PONDS
Trophic Structure and Energy Flow in a Texas Pond,
W82-02397 2H

Reassessment of the Effects of Construction Dewatering on Ground-Water Levels in the Cowles Unit, Indiana Dunes National Lakeshore, Indiana. Supplement to Geological Survey Water-Resources Investigations 78-138,
W82-02478 4A

POPULATION DENSITY
Variation in Life-History Patterns Between Intertidal and Subtidal Populations of the Meiobenthic Copepod Microarthridion Littorale,
W82-02560 2L

POPULATION DYNAMICS
Summer Population Fluctuations, Feeding, and Growth of Hydra in an Arctic Lake,
W82-02287 2H

The Recolonization of Lake Tahoe by Bosmina Longirostris: Evaluating the Importance of Reduced Mysis Relicta Populations,
W82-02305 2H

Interactions Potentially Affecting the Seasonal Abundance of Selected Aquatic Invertebrates in a Rice Field Habitat,
W82-02568 6G

PORE WATER
A Close-Interval Sampler for Collection of Sediment Pore Waters for Nutrient Analyses,
W82-02346 5A

POROUS CUP
A More Versatile Soil Water Sampler,
W82-02523 7B

PORTLAND
Energy Costs and Portland Water Supply System,
W82-02586 5F

POTABLE WATER
Trihalomethane Formation in North Carolina Drinking Waters,
W82-02195 5B

POTATOES
Aerated Drip Irrigation,
W82-02186 3F

Effect of Saline Irrigation Water on the Yield of Potato,
W82-02396 3C

POTENTIOMETRIC LEVEL
Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1981,
W82-02459 2F

Potentiometric Surface of the Floridan Aquifer, Southwest Florida Water Management District, May 1981,
W82-02464 7C

Potentiometric Surface of the Floridan Aquifer, St. John's River Water Management District and Vicinity, Florida, May 1981,
W82-02479 7C

POTOMAC RIVER
Photosynthetic Pigments as Indicators of Algal Activity in the Upper Potomac Estuary,
W82-02529 5B

POTOMAC RIVER BASIN
Point Process Models of Rainfall,
W82-02452 2A

POTOMAC RIVER ESTUARY
Freshwater Influences on Striped Bass Population Dynamics,
W82-02116 6G

Historical Overview of the Freshwater Inflow and Sewage Treatment Plant Discharges to the Potomac River Estuary with Resultant Nutrient and Water Quality Trends,
W82-02161 5C

POULTRY
Detection of Chloroform in the Tissues of Freshly Eviscerated Poultry Carcasses Exposed to Water Containing Added Chlorine or Chlorine Dioxide,
W82-02374 5A

PRECIPITATION
Accuracy of Point Precipitation Measurements,
W82-02209 2B

Dendroclimatic Estimates of a Drought Index for Northern Virginia,
W82-02468 2B

PREDATION
Interactions Potentially Affecting the Seasonal Abundance of Selected Aquatic Invertebrates in a Rice Field Habitat,
W82-02568 6G

PREDICTION
A Dynamic Methodology for Characterizing and Monitoring Estuarine Ecosystems,
W82-02167 7A

PRETREATMENT OF WATER
Non-Acid Pretreatment and Management of Microorganisms in Seawater Desalination by Reverse Osmosis,
W82-02108 3A

PRIMARY PRODUCTIVITY
Freshwater Inputs and Estuarine Productivity,
W82-02110 2L

Productivity of Four Marsh Sites Surrounding Lake Pontchartrain, Louisiana,
W82-02334 2H

Periphyton Production in an Appalachian Mountain Trout Stream,
W82-02335 5C

Primary Productivity and Trophic Status of a Kashmir Himalayan Lake,
W82-02414 2H

PROBABILITY DISTRIBUTION
Deriving Sediment Yield Probabilities for Evaluating Conservation Practices,
W82-02225 2J

PRODUCTIVITY
Metabolism of a Florida Lake Ecosystem,
W82-02268 2H

Nitrate and Ammonia Uptake in the Apex of the New York Bight,
W82-02286 5C

Trophic Changes Without Changes in the External Nutrient Loading,
W82-02367 2H

PUBLIC INVESTMENT
Legal, Economic and Institutional Barriers to Water Reuse in Northern New England, Boston, Massachusetts,
W82-02107 3C

PUBLIC OPINION
New Developments in Water Resources Management for Local Governments and Industries,
W82-02522 6E

PULP AND PAPER INDUSTRY
Source and Extent of Klebsiella Pneumoniae in the Paper Industry,
W82-02337 5B

An Evaluation of the Potential for Water Conservation and Reuse in the Georgia Pulp and Paper Industry,
W82-02456 3E

PULP WASTES
Main Compounds Behavior in Kraft Wastes Cleaning by Acid Coagulation and Carbon Adsorption,
W82-02383 5D

Enchytraeid Oligochaetes as Marine Pollution Indicators,
W82-02445 5A

PUMPAGE
Assessment of Eighteen Public Groundwater Supplies in Illinois,
W82-02510 2F

PUMPING
Reasonable Groundwater Pumping Levels Under the Appropriation Doctrine: The Law and Underlying Economic Goals,
W82-02503 6E

QUALITY CONTROL
New European Experiences in Removal of Organics in Surface Water Treatment,
W82-02420 5F

QUANTITATIVE ANALYSIS
Subdomain Integration Model of Ground-Water Flow,
W82-02550 2F

RADIAL GATES
Hydraulic Gates,
W82-02206 8C

RADIOACTIVE TECHNIQUES
Algal-Bacterial Symbiosis in the Chowan River, NC,
W82-02177 5A

RADIOACTIVE WASTES
Surface Water Hydrologic Criteria for Uranium Mine Tailings Impoundments in Ontario,
W82-02240 5E

Comparative Uptake of Actinides by Plants and Rats from the Shoreline of a Radioactive Pond,
W82-02323 5B

RADON
Vertical Mixing Rates in Fjords Determined Using Radon and Salinity as Tracers,
W82-02576 2L

RAINFALL
The Effects of Freshwater Inflow on Salinity and Zooplankton Populations at Four Stations in the Nueces-Corpus Christi and Copano-Aransas Bay Systems, Texas from October 1972-May 1975,
W82-02133 6G

Estuarine Benthic Community Dynamics Related to Freshwater Inflow to the Corpus Christi Bay Estuary,
W82-02135 2L

Rainfall-Related Trends in the Structure of a Fish-Crustacean Community in Texas' Galveston Bay System,
W82-02160 2L

Effects of Upland Drainage on Estuarine Nursery Areas of Pamlico Sound, North Carolina,
W82-02164 2L

W82-02466 2F

SPAWNING
Cumulative Effects of Logging Road Sediment on Salmonid Populations in the Clearwater River, Jefferson County, Washington,
W82-02507 2J

Characterization of Spawning Gravel and Stream System Evaluation,
W82-02509 2J

Stream System Evaluation with Emphasis on Spawning Habitat for Salmonids,
W82-02552 7B

SPECIFIC CAPACITY
Water Resources of the Kisatchie Well-Field Area Near Alexandria, Louisiana,
W82-02480 7C

SPECTRAL ANALYSIS
An Estimation of the Reaeration Coefficient in Natural Streams by Spectral Analysis of Time Series Data,
W82-02458 5G

SPILLWAYS
Passing Floodwaters Over Embankment Dams,
W82-02204 8A

Ski-Jump Spillway for India's Ukai Dam,
W82-02430 8A

SPIRAL-WOUND ELEMENTS
Development of High Salt Rejection Reverse Osmosis Membranes--Final Report, July 1, 1978 Through December 31, 1980,
W82-02109 3A

SPORT FISHING
The Effects of Freshwater Discharges on Sportfishing Catch Rates in the St. Lucie Estuary, Martin County, Florida,
W82-02124 6G

The Warmwater Sport Fishery of Eastern Lake Ontario,
W82-02296 7A

SPRING BROOK BASIN
Comparison of Behavior of Two Sub-Basins in the Turtle Creek Drainage System,
W82-02528 2A

SPRINGS
Geochemical Evidence on the Nature of the Basement Rocks of the Sierra Nevada, California,
W82-02460 2K

SPRINKLER IRRIGATION
Solid Set Irrigation System Design Using Linear Programming,
W82-02273 6A

ST. LAWRENCE ESTUARY
On the Advection of Turbidity in the Saint Lawrence Middle Estuary,
W82-02344 2L

ST. LAWRENCE RIVER
Zooplankton Sample Variability in a Tidal Estuary: An Interpretative Model,
W82-02306 2L

ST LUCIE ESTUARY
The Effects of Freshwater Discharges on Sportfishing Catch Rates in the St. Lucie Estuary, Martin County, Florida,
W82-02124 6G

STATE JURISDICTION
Assessment of the National Water Quality Management Program, Vol. I, 106 Program Overview, Planning and Standards.
W82-02181 6E

Assessment of the National Water Quality Management Program, Volume 3: Industrial and Municipal Control.
W82-02183 6E

Superfund: What a Mess,
W82-02184 6E

Do State Water Anti-Exportation Statutes Violate the Commerce Clause. Or Will New Mexico's Embargo Law Hold Water,
W82-02279 6E

Appalachian Regional Commission and the Coastal Plains Regional Commission,
W82-02515 6E

STATISTICAL MODELS
A Monthly Time Series Model of Municipal Water Demand,
W82-02263 6D

The Integrity of Existing Distribution Systems,
W82-02450 5F

STEEL PIPES
42-Mile Water Pipeline for Coal Boom Town.
W82-02359 6D

STORAGE COEFFICIENTS
Aquifer Response Due to Zones of Higher Permeability and Storage Coefficient,
W82-02190 2F

STORM RUNOFF
Physical and Geochemical Characteristics of Suspended Solids, Wilton Creek, Ontario,
W82-02236 5B

Stormwater Quality Processes for Three Land-Use Areas in Broward County, Florida,
W82-02469 5B

Flood of November 26-27, 1979, in Essex County, New York,
W82-02483 2E

STORM WATER
Real-Time Rainfall Monitoring-Prediction System and Urban Hydrologic Operations,
W82-02588 7A

Comparison of Detention Basin Planning and Design Models,
W82-02592 6A

Automated Stream Diversion for Reservoir Protection,
W82-02600 5G

STRATIFICATION
Formation of a Bottom Flow in a Natural Water Body with Various Types of Density Stratification,
W82-02205 2J

Wind-Induced Mixing in Stratified Fluid,
W82-02371 2H

STREAM FISHERIES
Mt. St. Helens and the Fish,
W82-02508 2J

Characterization of Spawning Gravel and Stream System Evaluation,
W82-02509 2J

STREAMBEDS
Stream System Evaluation with Emphasis on Spawning Habitat for Salmonids,
W82-02552 7B

STREAMFLOW
The Effects of Freshwater Inflow on Salinity and Zooplankton Populations at Four Stations in the Nueces-Corpus Christi and Copano-Aransas Bay Systems, Texas from October 1972-May 1975,
W82-02133 6G

Distribution of Joint Run-Lengths of Bivariate Markov Processes,
W82-02191 2E

Snowmelt, Glacier Melt, and High Arctic Streamflow Regimes,
W82-02249 2A

A Review of Single-Site Models for Monthly Streamflow Generation,
W82-02368 2E

Water-Resources Information for the Withlacoochee River Region, West-Central Florida,
W82-02473 6B

STREAMFLOW DEPLETION
Overview of Freshwater Inflow Depletions,
W82-02152 6D

STREAMFLOW FORECASTING
Point Process Models of Rainfall,
W82-02452 2A

Selecting Seasonal Streamflow Models,
W82-02502 2E

STREAMS
Structural Characteristics of Algal Communities in Thermal Altered Artificial Streams,
W82-02399 5C

Discharge and Chemical Changes in a Chalk Stream Headwater Affected by the Outflow of a Commercial Watercress-Bed,
W82-02429 5C

Application of the Expanded Bed Technique for the Denitrification of a Sewage Effluent,
W82-02436 5D

The Seasonal Variation in Silicon Concentration in Chalk-Streams in Relation to Diatom Growth,
W82-02439 5B

Water-Quality Reconnaissance of the Larkin Creek Watershed, Lee and St. Francis Counties, Arkansas,
W82-02489 5A

Water Quality of a Southeast Texas Stream,
W82-02570 2K

STRESS ANALYSIS
Analysis of Rock Stress Around a Liquid Waste Injection System in Illinois,
W82-02280 5E

SUBSURFACE DRAINAGE
Use of Horizontal Drains: Case Histories from the Colorado Division of Highways,
W82-02211 8A

Horizontal Drains and Horizontal Drilling: An Overview,
W82-02215 8A

Nutrient and Sediment Loadings from a Subsurface Drainage System,
W82-02266 5B

SURFACE DRAINAGE
Preliminary Appraisal of Ephemeral-Streamflow Characteristics as Related to Drainage Area, Active-Channel Width, and Soils in Northwestern New Mexico,
W82-02476 2E

SURFACE FLOW
Surface Water Flow from a South Florida Wetland Area,
W82-02121 2E

SURFACE-GROUNDWATER RELATIONS
Proceedings and Recommendations of the Workshop on Groundwater Problems in the Ohio River Basin, April 28-29, 1981. Cincinnati, Ohio.
W82-02106 2F

Aquifer Response Due to Zones of Higher Permeability and Storage Coefficient,
W82-02190 2F

Comparison of Groundwater and Surface Water for Patterns and Levels of Contamination by Toxic Substances,
W82-02541 5A

SURFACE WATER
Impact of Suburban Residential Development on Water Resources in the Area of Winslow Township, Camden County, New Jersey,
W82-02461 4C

Current Water-Resources Investigations of the U.S. Geological Survey in North Dakota--Fiscal Year 1981.
W82-02463 7C

Water-Resources Information for the Withlacoochee River Region, West-Central Florida,
W82-02473 6B

Water Resources Data for Utah, Water Year 1979.
W82-02474 7C

Water-Resources Investigations of the U.S. Geological Survey in Missouri--Fiscal Year 1981.
W82-02488 7C

Water-Quality Reconnaissance of the Larkin Creek Watershed, Lee and St. Francis Counties, Arkansas,
W82-02489 5A

Water Resources Data for Indiana, Water Year 1980.
W82-02492 7C

Water Resources Data for Florida, Water Year 1980--Volume 4. Northwest Florida.
W82-02493 7C

Water Resources Data for Pennsylvania, Water Year 1980--Volume 3. Ohio River and St. Lawrence River Basins.
W82-02494 7C

Water Resources Data for Wyoming, Water Year 1980--Volume 2. Green River Basin, Bear River Basin, and Snake River Basin.
W82-02495 7C

Water Resources Data for Minnesota, Water Year 1980--Volume 1. Great Lakes and Souris-Red-Rainy River Basins.
W82-02496 7C

Water Resources Data for Minnesota, Water Year 1980–Volume 2. Upper Mississippi and Missouri River Basins.
W82-02497 7C

Water Resources Data for New Mexico, Water Year 1980.
W82-02498 7C

Water Resources Data for Kentucky, Water Year 1979.
W82-02499 7C

Hydrologic Reconnaissance of the Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W82-02500 7C

SUSPENDED LOAD
Major- and Trace-Element Composition of Suspended Matter in the North-East Gulf of Alaska: Relationships with Major Sources,
W82-02259 5B

SUSPENDED SEDIMENTS
The Suspended Sediment-Water Partitioning Coefficient for Kepone in the James River, Virginia,
W82-02284 5B

Velocity Profiles with Suspended Sediment,
W82-02581 2J

Modeling Suspended Solids and Bacteria in Ford Lake,
W82-02595 5B

SUSPENDED SOLIDS
The Nutritional Significance of the Distribution of Suspended Particulate Material in the Upper San-Francisco Bay-Estuary,
W82-02140 2L

The Downstream Transport of Fine Material and the Organic Matter Balance for a Section of a Small Chalk Stream in Southern England,
W82-02192 1B

Physical and Geochemical Characteristics of Suspended Solids, Wilton Creek, Ontario,
W82-02236 5B

Evaluation of Automatic Suspended Solids Sampling Procedures,
W82-02316 5A

A Compendium of Experimental Work on Chemical Precipitation of Sewage,
W82-02370 5D

SWEDEN
Trophic Changes Without Changes in the External Nutrient Loading,
W82-02367 2H

Interactions Between Lugol's Fixative and Ethylene in the Acetylene-Reduction Assay for Nitrogenase Activity in Lake Water,
W82-02380 2K

Jonkoping's Water Supply,
W82-02419 5F

SWINE WASTE
Economic and Technical Evaluations of Swine Manure Management Systems Which Use Land Applications,
W82-02175 5E

SWITZERLAND
New European Experiences in Removal of Organics in Surface Water Treatment,
W82-02420 5F

SYSTEMS ANALYSIS
Systems Analysis Applied to Water Management in Developing Countries: Problems and Prospects,
W82-02441 6A

TANANA RIVER
Sediment Transport in the Tanana River Near Fairbanks, Alaska, 1977-79,
W82-02472 2J

TEMPERATURE
The Effect of Environmental Factors on Phytoplankton Growth: Temperature and the Interactions of Temperature with Nutrient Limitation,
W82-02221 2H

TEMPERATURE EFFECTS
Some Types of Temperature Inversion Encountered in a Freshwater Lake with Short Residence Time,
W82-02224 2H

Frequencies of Developmental Morphs of Chaoborus Americanus in Four Fishless Bog Lakes,
W82-02238 2H

Productivity and Species Composition of Algal Mat Communities Exposed to a Fluctuating Thermal Regime,
W82-02356 5C

Field Studies of the Temperature Regime and Stress State of the Concrete in Arch Dams Subjected to Various Methods of Cooling,
W82-02387 8A

Structural Characteristics of Algal Communities in Thermal Altered Artificial Streams,
W82-02399 5C

Effect of Pembroke Power Station on the Temperatures in Milford Haven, Wales,
W82-02406 5C

TEMPERATURE GRADIENT
The Thermal Response of Lake Ohrid, Yugoslavia to Meteorological Conditions,
W82-02342 2H

TENNESSEE
LARM Two-Dimensional Model: An Evaluation,
W82-02597 4A

TEXAS
Texas Shrimp Fisheries and Freshwater Inflow,
W82-02131 6G

The Effects of Freshwater Inflow on Salinity and Zooplankton Populations at Four Stations in the Nueces-Corpus Christi and Copano-Aransas Bay Systems, Texas from October 1972-May 1975,
W82-02133 6G

Nutrient Flux Between the Nueces Deltaic Marsh and the Nueces Estuary on the Texas Gulf Coast,
W82-02134 2L

The Mouth of the Colorado River Project; An Economic Development Environmental Enhancement Project,
W82-02148 4A

Effects of Alterations of Freshwater Inflows into Matagorda Bay, Texas,
W82-02149 6G

Loss of Colorado River Inflows to Matagorda Bay, Texas, and Efforts for Restoration,
W82-02151 4A

An Overview of Texas Law, Policy, and Agency Actions Concerning Estuarine Inflow,
W82-02154 6E

Texas to Vote on Water Trust Fund.
W82-02302 6C

Trophic Structure and Energy Flow in a Texas Pond,
W82-02397 2H

Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1981,
W82-02459 2F

Altitude of the Water Table in the Alluvial and Other Shallow Aquifers Along the Colorado River Near La Grange, Texas, December 1980,
W82-02491 7C

Water Quality of a Southeast Texas Stream,
W82-02570 2K

Operation Policy Analysis: Sam Rayburn Reservoir,
W82-02589 6A

THAILAND
Emphasis on Distribution: Strategies for Small Scale Water Resources Development in Thailand,
W82-02408 6A

THAMES ESTUARY
Sewage Outfall Location Reduces Environmental Damage in the Thames Estuary,
W82-02404 5G

THAMES RIVER
Bioassays of Waters from the Severn and Thames River Systems,
W82-02448 5A

THERMAL POLLUTION
Productivity and Species Composition of Algal Mat Communities Exposed to a Fluctuating Thermal Regime,
W82-02356 5C

Structural Characteristics of Algal Communities in Thermal Altered Artificial Streams,
W82-02399 5C

Multiport Diffuser Mixing Zones in Rivers,
W82-02594 5B

THERMAL POWERPLANTS
Geothermal Energy: An Old Ally,
W82-02333 2F

THERMAL PROPERTIES
Thermal Convection in a Nonhomogeneous Aquifer,
W82-02288 2F

THERMAL STRATIFICATION
Some Types of Temperature Inversion Encountered in a Freshwater Lake with Short Residence Time,
W82-02224 2H

THIOCYANATES
Thiocyanate Bio-Oxidation Kinetics,
W82-02596 5D

TIDAL CURRENTS
A Numerical Simulation of the Vertical and Horizontal M2 Tide in the Bristol Channel and Comparisons with Observed Data,
W82-02193 2L

TIDAL EFFECTS
Nutrient Flux Between the Nueces Deltaic Marsh and the Nueces Estuary on the Texas Gulf Coast,
W82-02134 2L

Zooplankton Sample Variability in a Tidal Estuary: An Interpretative Model,
W82-02306 2L

TIDAL MARSHES
Nutrient Flux Between the Nueces Deltaic Marsh and the Nueces Estuary on the Texas Gulf Coast,
W82-02134 2L

Phytoplankton Production and Community Composition in a Marsh-Dominated Estuary Which Receives Sewage Waste,
W82-02179 5C

Seasonal Patterns of Plant and Soil Water Potential on an Irregularly-Flooded Tidal Marsh,
W82-02340 2I

TIDES
Concentration, Extent, and Duration of Salinity Intrusion into the Columbia River Estuary, September-October, 1977-1978,
W82-02139 2L

TILE DRAINAGE
Nitrate-Nitrogen in Tile Drainage as Affected by Fertilization,
W82-02269 5B

TIME SERIES ANALYSIS
A Monthly Time Series Model of Municipal Water Demand,
W32-02263 6D

An Estimation of the Reaeration Coefficient in Natural Streams by Spectral Analysis of Time Series Data,
W82-02458 5G

TOKYO BAY
Distribution on Viable Marine Bacteria in Neritic Seawater Around Japan,
W82-02427 5A

TOOLIK LAKE
Summer Population Fluctuations, Feeding, and Growth of Hydra in an Arctic Lake,
W82-02287 2H

TORONTO HARBOR
Some Measurements on Near Surface Turbulence in the Depth Direction and Some Phytoplankton Distribution Implications,
W82-02227 7B

TOXICITY
Heavy Metals and Marine Phytoplankton: Correlation of Toxicity and Sulfhydryl-Binding,
W82-02272 5C

The Toxicity of 2,4-D to Cyprinus Carpio Var. Communis in Relation to the Seasonal Variation in the Temperature,
W82-02294 5C

The Effect of Aquatic Humus on the Biological Availability of Cadmium,
W82-02353 5C

TOXINS
Comparison of Groundwater and Surface Water for Patterns and Levels of Contamination by Toxic Substances,
W82-02541 5A

TRACE METALS
Seasonal Variation in the Trace Metal Content of Mytilus Edulis,
W82-02312 5C

Sources of Twelve Trace Metals in Antarctic Snows Determined by Principal Component Analysis,
W82-02378 5B

Discussion of Trace Metals in the Waters of a Partially-Mixed Estuary,
W82-02542 2L

TRACERS
Characterization of Oil Spills on Inland and Estuarine Waters,
W82-02393 5B

TRANSMISSIVITY
A Formula for Estimating Fissure Transmissivities from Steady-State Injection-Test Data,
W82-02292 8E

Water Resources of the Kisatchie Well-Field Area Near Alexandria, Louisiana,
W82-02480 7C

TRICKLING FILTERS
Coupled Trickling Filter-Rotating Biological Contactor Nitrification Process,
W82-02315 5D

TRIHALOMETHANES
Trihalomethane Formation in North Carolina Drinking Waters,
W82-02195 5B

TROPHIC LEVEL
Trophic Structure and Energy Flow in a Texas Pond,
W82-02397 2H

On the Trophic Status and Conservation of Kashmir Lakes,
W82-02412 5C

Primary Productivity and Trophic Status of a Kashmir Himalayan Lake,
W82-02414 2H

TURBIDITY
On the Advection of Turbidity in the Saint Lawrence Middle Estuary,
W82-02344 2L

TURBULENT FLOW
Turbulence Model for Flow Over Dredged Channels,
W82-02201 8B

Some Measurements on Near Surface Turbulence in the Depth Direction and Some Phytoplankton Distribution Implications,
W82-02227 7B

The Mixing Layer of Loch Ness,
W82-02421 2H

U.S. GEOLOGICAL SURVEY
Identification Codes for Organizations Listed in Computerized Data Systems of the U.S. Geological Survey,
W82-02486 10D

UKAI DAM
Ski-Jump Spillway for India's Ukai Dam,
W82-02430 8A

UNCONFINED AQUIFERS
The Ground Water Flow System in the Vicinity of Marco Island, Florida,
W82-02123 2F

UNDERGROUND WASTE DISPOSAL
Analysis of Rock Stress Around a Liquid Waste Injection System in Illinois,
W82-02280 5E

UNITED KINGDOM
Disposal of Industrial Effluents - Some Future Problems,
W82-02405 5D

An Industrial View. Treatment Vis-A-Vis Discharge to Sewers,
W82-02407 6G

Groundwater Quality in the Severn-Trent Region,
W82-02423 5A

The Integrity of Existing Distribution Systems,
W82-02450 5F

URBAN AREAS
Analytical Cost Model for Urban Water Supply,
W82-02584 6C

URBAN DRAINAGE
Comparison of Detention Basin Planning and Design Models,
W82-02592 6A

URBAN HYDROLOGY
Real-Time Rainfall Monitoring-Prediction System and Urban Hydrologic Operations,
W82-02588 7A

URBAN PLANNING
Institutional Barriers to Water Quality Planning and Management in the Southeast - Vol I - Technical Report, Part I - Institutional Barriers,
W82-02101 6E

Institutional Barriers to Water Quality Planning and Management in the Southeast - Vol II - Technical Report, Part II - Issues, Problems, and Data,
W82-02102 6E

URBAN RUNOFF
Continuous Simulation of Receiving Water Quality Transients,
W82-02271 5B

Stormwater Quality Processes for Three Land-Use Areas in Broward County, Florida,
W82-02469 5B

URBAN WATERSHEDS
Comparison of Behavior of Two Sub-Basins in the Turtle Creek Drainage System,
W82-02528 2A

URBANIZATION
The Impact of Urbanization on Seasonal Hydrologic and Nutrient Budgets of a Small North American Watershed,
W82-02400 5B

Water Resources Protection Measures in Land Development - A Handbook - Revised Edition,
W82-02453 4D

Impact of Suburban Residential Development on Water Resources in the Area of Winslow Township, Camden County, New Jersey,
W82-02461 4C

USSR
On the Dynamics of Feeding of Young Fish from Mozhaysk Reservoir in Various Years,
W82-02434 2H

UTAH
An Initial Application of Polarization Lidar for Orographic Cloud Seeding Operations,
W82-02217 7B

Water Resources Data for Utah, Water Year 1979.
W82-02474 7C

Hydrologic Reconnaissance of the Wasatch Plateau-Book Cliffs Coal-Fields Area, Utah,
W82-02500 7C

VAPOR COMPRESSION EVAPORATION
Operating Characteristics of Various Combinations of Working Substances and Feeds in the Schroeder Desalting Process.
W82-02105 3A

VARIABILITY
A Dynamic Methodology for Characterizing and Monitoring Estuarine Ecosystems,
W82-02167 7A

VEGETATION
The Patterned Mires of the Red Lake Peatland, Northern Minnesota: Vegetation, Water Chemistry, and Landforms,
W82-02300 2H

VEGETATION EFFECTS
Estimating Contribution of Overstory Vegetation to Stream Surface Shade,
W82-02301 2I

VELOCITY COEFFICIENTS
Velocity Profiles with Suspended Sediment,
W82-02581 2J

VERTICAL TUBE EVAPORATION
Operating Characteristics of Various Combinations of Working Substances and Feeds in the Schroeder Desalting Process.
W82-02105 3A

VIRGINIA
Dendroclimatic Estimates of a Drought Index for Northern Virginia,
W82-02468 2B

VIRUS
Positively Charged Filters for Virus Recovery from Wastewater Treatment Plant Effluents,
W82-02338 5A

VIRUSES
Development of Immunoenzymatic Methods for Detection and Quantitation of Poliovirus,
W82-02176 5A

Viral Transport to Ground Water at a Wastewater Land Application Site,
W82-02317 3C

Distribution of Ribonucleic Acid Coliphages in Raw Sewage from Treatment Plants in Japan,
W82-02443 5A

VITAMINS
Seasonal Variation of Vitamin B12, B12 Analogs, and Phytoplankton in a Long Island Estuary,
W82-02282 2L

VOLCANOES
Mt. St. Helens and the Fish,
W82-02508 2J

SELECTED
WATER RESOURCES
ABSTRACTS

A monthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 15, NUMBER 6
JUNE 1, 1982

W82-02601 -- W82-03000

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff, Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

RECONNAISSANCE OF THE HOT SPRINGS MOUNTAINS AND ADJACENT AREAS, CHURCHILL COUNTY, NEVADA,
Geological Survey, Menlo Park, CA. Water Resources Div.
N. E. Voegtly.
Available from OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.25 in paper copy, $4.00 in microfiche. Geological Survey Open-File Report 81-134, 1981. 10 p, 1 Plate, 13 Ref.

Descriptors: Structural geology, *Geologic fractures, Rocks, Mountains, *Stratigraphy, *Geohydrology, Test wells, *Geothermal studies, *Nevada, *Churchill County, Hot Springs Mountains, Thermal water, Geologic mapping.

A geologic reconnaissance of the Hot Springs Mountains and adjacent areas, which include parts of the Brady-Hazen and the Stillwater-Soda Lake Known Geothermal Resource Areas, during June-December 1975, resulted in a reinterpretation of the nature and location of some Basin and Range faults. In addition, the late Cenozoic stratigraphy has been modified, chiefly on the basis of radiometric dates of volcanic rocks by U.S. Geological Survey personnel and others. The Hot Springs Mountains are in the western part of the Basin and Range province, which is characterized by east-west crustal extension and associated normal faulting. In the surrounding Trinity, West Humboldt, Stillwater, and Desert Mountains, Cenozoic rocks overlie 'basement' rocks of the Paleozoic and Mesozoic age. A similar relation is inferred in the Hot Springs Mountains. Folding and faulting have taken place from the late Tertiary to the present. (USGS)

1B. Aqueous Solutions and Suspensions

TRANSFER OF VOLATILE SUBSTANCES FROM WATER TO THE ATMOSPHERE,
Eidgenoessesche Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
C. Matter-Muller, W. Gujer, and W. Giger.
Water Research, Vol 15, No 11, p 1271-1279, November, 1981. 5 Fig, 4 Tab, 19 Ref.

Descriptors: *Aeration, *Mass transfer, *Organic compounds, Surfactants, Diffusion coefficient, Trickling filters, Air stripping, Wastewater treatment, Activated sludge process, Bubbles, Volatile compounds, Air-water interfaces, Air pollution.

Surface aeration systems and trickling filters can efficiently strip volatile compounds during wastewater treatment. Bubble aeration systems are less efficient, and pure oxygen activated sludge plants are inefficient. Theory and experimental data on aerator systems in batch and continuous flow reactors are analyzed. Equations are given for three ranges of the degree of saturation of the exit gas (far from saturated, partially saturated with the volatile compound, and in equilibrium with the liquid). The ratios of the molecular diffusion coefficient of a compound and oxygen in the water were as follows: oxygen, 1.00; 1,1-dichloroethylene, 0.62; tetrachloroethylene, 0.55; benzene, 0.53; toluene, 0.53; 1,2,4-trimethylbenzene, 0.39; and 1,4-dichlorobenzene, 0.39. The surface active agents tested (Marlon A, bactopeptone, and palmitic acid) had variable effects on the mass transfer coefficients of tetrachloroethylene. (Cassar-FRC)
W82-02902

WATER-PHOSPHORIC ACID MEDIA: ELECTROCHEMICAL PROPERTIES,
Nancy-1 Univ. (France). Lab. de Chimie et 'Electrochimie Analytique.
C. Louis, and J. Bessiere.
Analytical Letters, Vol 13, No A 11, p 937-946, 1980. 1 Fig, 8 Ref.

Descriptors: *Electrochemistry, *Phosphoric acid, Chemical reactions, Electrolysis, Solutes, Acidity, Chemical properties.

Electroactivity ranges of water-phosphoric acid media were determined at various electrodes. The behavior of the ferricinium/ferrocene comparison system was studied. Electrodes used included polished platinum, various carbon, and mercury. The aqueous saturated calomel electrode was used as a reference system. The oxidizing properties of water-phosphoric acid media increased with increasing phosphoric acid concentration. Reducing properties in water-phosphoric acid mixtures depend on the acidity level and water activity. In the different mixtures used the thermodynamic range extended over 1.23 V. The electrochemical properties of the 5.5 M and 11.5 M phosphoric acid industrial mixtures could be compared. (Baker-FRC)
W82-02943

SETTLING VELOCITY OF SPHERICAL PARTICLES IN CALM WATER,
Ecole Polytechnique Federale de Lausanne (Switzerland).
J. L. Boillat, and W. H. Graf.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY 10, p 1123-1131, October, 1981. 6 Fig, 1 Tab, 10 Ref.

Descriptors: *Settling velocity, *Sediments, *Drag, Particulate matter, Physical properties, Water properties, *Particle size, Calm water.

The settling velocity of spherical particles 0.200 to 1.905 cm in diameter and 1.018 to 2.700 g per cu cm in density in calm water were measured by video techniques at a precision of 1/40 sec. The results were about 20% higher than the standard CTS=f(R) curve, which was developed from fixed spheres tested in wind tunnels. This preliminary data is not sufficient to propose a new drag coefficient for freely falling spheres. Further research is suggested, perhaps concerning the effects of the Strouhal number on the drag of freely falling spheres. (Cassar-FRC)

APPROXIMATE ERROR BOUNDS FOR SIMULATED HYDROGRAPHS,
Washington Univ., Seattle. Dept. of Civil Engineering.
D. C. Garen, and S. J. Burges.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1519-1534, 1981. 2 Fig, 6 Tab, 25 Ref.

Descriptors: *Hydrographs, *Error analysis, Simulation, Errors, *Rainfall-runoff relationships, Rainfall, Storms, Rain, Model studies, Monte Carlo method, Mathematical studies, *Watersheds.

The applicability of first-order uncertainty analysis to a complex watershed model to quantify parameter error propagation and to gain an appreciation of the approximate magnitudes of model output uncertainty caused by different levels of parameter uncertainty was investigated. The study focuses on the estimation of error bounds for simulated hydrographs, assuming the model to be perfect and accounting only for output uncertainty caused by uncertainty in parameter values. First-order uncertainty analysis is applid to the Stanford Watershed Model to calculate the effects of parameter uncertainty as it propagates through the model. The first order approximations to the mean and standard deviation of model output are compared to estimates of the same quantities, using Monte Carlo analysis. This was done to identify the degree of parameter error for which the first order approximations are valid. First order analysis was found to give good approximations if the coefficients of variation on sensitive parameters were less than about 0.25. First order analysis allows a large reduction in computation over Monte Carlo methods for estimating error bounds on simulated hydrographs. Based upon storm types and initial moisture contents examined here it is clear that different streamflow uncertainty levels can be expected at different times of the year in any catchment. While the findings given here were developed for the particular watershed model, the method should be applicable to all complex moisture accounting rainfall-runoff models. (Baker-FRC)
W82-02678

ANALYSIS OF FLOOD HYDROGRAPHS FROM WETLAND AREAS,
G. L. Fagan, Jr.
PhD Dissertation, June, 1981. 301 p, 25 Fig, 28 Tab, 119 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-18869.

Descriptors: *Hydrograph analysis, *Flood hydrographs, *Wetlands, *Unit hydrographs, Flood discharge, Precipitation, Runoff, Great Swamp, Passaic River basin, *New Jersey.

Many natural wetlands and water courses serve the valuable function of reducing flood peaks and lessening high flood stages. Such effects may be substantially altered or eliminated by man's activities. This research presents the results of a project to predict flood discharges from wetland areas. Hydrographs from several non-winter flood events resulting solely from precipitation, in the Great Swamp in the Passaic River Basin in New Jersey, were studied in an attempt to explain the runoff regimen that exists. Examination of the hydrographs showed that for a given precipitation volume, the volume of surface runoff during the flood event decreased with increasingly wetter antecedent precipitation conditions. This finding is contrary to what would generally be expected for a non-wetland area. In addition, a statistical analysis determined that the loss, which is the difference between the total precipitation volume and the runoff volume, was significantly correlated with the total precipitation volume and antecedent precipitation conditions. Unit hydrographs developed from flood hydrographs were studied and found to be inadequate as a means of predicting peak discharges for specified precipitation patterns. However it was found that the unit hydrograph peak generally decreased with increasing volume of precipitation excess and the duration of this excess. The analyses provided the basis of a statistical approach for predicting flood discharges with limited precipitation and flow data. The results of the research should be of significance in the planning and design of flood control works, the conservation and development of wetland areas, and the evaluation of flood risks for areas downstream of wetland areas. (Sinha-OEIS)
W82-02733

STUDIES OF BIOLOGICAL NITROGEN CYCLE PROCESSES IN THE UPPER WATERS OF THE OCEAN, WITH SPECIAL REFERENCE TO THE PRIMARY NITRITE MAXIMUM,
Scripps Institution of Oceanography, La Jolla, CA.
R. J. Olson.
PhD Dissertation, 1980. 264 p, 53 Fig, 15 Tab, Numerous Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-00032.

Descriptors: *Nitrogen cycle, *Marine biology, *Metabolism, Nitrates, Nitrites, Photosynthesis, Phytoplankton, Bacteria, Bioindicators, Biological properties, North Pacific Ocean.

An investigation of components of the marine nitrogen cycle in oxygenated waters was undertaken. Experiments with pure cultures of phytoplankton and natural populations of phytoplankton and bacteria were used to relate metabolic activities to observed distributions of nitrogenous nutrients. Two studies of the central North Pacific Gyre were done to determine the depth profiles of biologically important parameters in upper and deep waters. On the basis of observed nitrate and nitrite distributions, a simple box model was constructed which showed that the amount of nitrate entering the euphotic zone via mixing was sufficient to account for the appearance of nitrite in the primary nitrite maximum. Laboratory culture experiments with a marine diatom gave results consistent with the proposed nitrite loss during nitrate assimilation by phytoplankton. (Sinha-OEIS)
W82-02742

OUTFLOW OF VOLCANIC ROCK AND GAS DURING OPENING OF THE ARPA-SEVAN TUNNEL,

V. I. Nikolin, E. S. Matlak, A. V. Sarkisyan, and M. G. Bikineev.
Hydrotechnical Construction, No 6, p 581-586, June, 1980. 2 Fig, 2 Tab, 6 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 6, p 24-27, June, 1980.

Descriptors: *Tunnel construction, *Geologic formations, Drilling, Volcanoes, Carbon dioxide, Water, Rocks, Rapid excavation, *Diversion structures, Arpa River, Sevan Lake, *Russia.

A 48.3 kilometer tunnel is being built to divert a portion of the Arpa River into Lake Sevan. The region through which the tunnel will pass is listed as seismically dangerous due to the tectonic processes which continue there even though volcanic activity in this region terminated in the Quaternary period. Rocks are basically magmatic varieties. The tunnel is being opened by the drill-and-blast method. During the opening of the tunnel, an influx of hot gasified water and long- and short-term active blower gas liberations occurred in significant amounts in virtually all tunnel cuts. The first such gas-dynamic phenomenon occurred on March 13, 1977, and was determined to belong to a class of porphyrite and carbon dioxide ejections. Overflows of mineral groundwater were found, saturated with carbon dioxide, associated with the large tectonic cracks and crushing zones. After the first heavy liberation of gas and water, outflows of carbon dioxide and water occurred at other stations. As a result of the gas-dynamic phenomena, rock debris was strewn over a distance of up to 150 meters from the cut, severely impairing the safety of the workers and leading to increased costs and construction time. The situation was investigated through the drilling of several boreholes. The following conclusions were drawn. All outflows occurred in porphyrites which were classed as water- and gas-water-bearing rocks at a depth of over 600 meters. Basic signs of porphyrite proneness to outflow include reduced strength and the extent to which the porphyrites are disturbed, increased venting of gas from blast holes during drilling, presence of circular macrocracks in cores, and separation of the core into thin disks or disintegration to a state of sand. (Baker-FRC)
W82-02772

MATHEMATICAL MODELS OF WATER YIELD WITH PARTICULAR REFERENCE TO MISSISSIPPI WATERSHEDS: INTERIM REPORT NO. 1, A STUDY OF SOME EMPIRICAL METHODS OF DETERMINING THE UNIT HYDROGRAPH,

Mississippi State Univ., Mississippi State.
V. P. Singh, and A. Baniukiewicz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168485, Price codes: A10 in paper copy, A01 in microfiche. Water Resources Research Institute, Mississippi State University Report, September, 1980. 198 p, 121 Fig, 22 Tab, 13 Ref. OWRT-A-129-MISS(1), 14-34-0001-0126.

Descriptors: Unit hydrographs, Matrix methods, Transform methods, Time series methods, Linear programming, Error analysis, Sensitivity analysis, Reproduction, Regeneration, *Prediction, *Statistical measures, *Ranking, *Small watersheds, Agricultural watersheds, *Mississippi, *Water yield, *Model studies, Linear theory, Statistical methods.

An attempt was made to evaluate, compare and rank nine different methods of deriving the unit hydrograph (UH) on a small agricultural watershed, which included (1) matrix methods, (2) transform methods, (3) time series methods, and (4) linear programming methods. Although the matrix methods, except for the least squares method, yield exact solution for the UH, these methods are not suitable for deriving the representative UH for a given watershed. However, transform, time series and linear programming methods can be used as effective tools in the UH derivation. Based on the results of this study the least squares, Laguerre and harmonic methods are probably the best methods. This is particularly true if rainfall-runoff data is subject to error. However, if the errors in data are large, the Simplex method may be the best. Also this is the only method which is capable of yielding the representative UH, whereas the other methods are not. Meixner polynomials, time series and Simplex methods can also be used as effective tools in the UH derivation. It must be noted that these conclusions are based on a small rural watershed. Whether these will be valid for a larger watershed in a different hydrometeorologic setting remains an interesting question for investigation.
W82-02803

EFFECT OF IRRIGATION ON GROUNDWATER RESOURCES WITH SPECIAL REFERENCE TO THE VAKHSH VALLEY,

All-Union Scientific-Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
V. A. Baron, and K. K. Bisembaeva.
Water Resources (English Translation), Vol 7, No 6, p 545-555, November/December, 1980. 1 Fig, 2 Tab, 16 Ref. Translated from Vodnye Resursy, No 6, p 120-126, November-December, 1980.

Descriptors: *Irrigation effects, *Groundwater recharge, *Hydrologic balance, Infiltration, Irrigation, Agriculture, Terracing, Groundwater management, *USSR, Vakhsh Valley.

The development of irrigated farmland causes an increase in groundwater which in turn requires increased drainage. The formation of the water balance of the Vakhsh Valley, a typical large valley in southern Tadzhikistan, was examined. Substantial changes have occurred in this semidesert region, and a model was constructed to study the changes. It considered groundwater recharge under natural conditions, the amount of groundwater runoff into the Vakhsh River, and recent changes in groundwater runoff and recharge. In the area where irrigation was increased by 50% due to the development of additional terraces, the average value of the resultant recharge increased from 17 to 48 mm/yr. Under undisturbed conditions, natural groundwater resources were 40 mm/yr or 1.52 cu m/sec. Natural resources have been increased by the irrigation projects. (Small-FRC)
W82-02851

TIDES AND TIDAL DATUMS IN THE UNITED STATES,

Coastal Engineering Research Center, Fort Belvoir, VA.
D. L. Harris.
Special Report No 7, February, 1981. 382 p, 32 Fig, 17 Tab, 67 Ref, 3 Append.

Descriptors: *Tides, *Tidal range, *Sea level, *Elevation, Great Lakes, Tidal hydraulics, Navigation, Lakes.

This report was developed to provide engineers with a ready reference to information about tidal datums and tide characteristics, and to provide information about the statistical distribution of astronomical tidal heights which can be used in setting and measuring the elevation of proposed engineering works or combined with similar statistics for storm surges and tsunamis to estimate the probability of extreme water levels. Tidal datums of practical importance include: mean sea level, mean low water or mean lower low water for most navigation-related activities, mean high water or mean higher high water for developments of land above mean sea level, and the National Geodetic Vertical Datum (NGVD) for comparing land elevations where no tide observations are available and at interior locations where tide observations are impossible. Special datums for the Great Lakes region, based on the assumption that the mean water level in each lake defines a level surface, have been in use for more than a century. An international coordination committee adopted a Great Lakes datum called the International Great Lakes Datum (IGLD) of 1955, which has gained wide acceptance in both the United States and Canada. Statistical characteristics of the astronomical tides at various ports were investigated. The distribution function for astronomical tide heights is found to be nearly symmetric at many stations. At many other continental tide stations, the astronomical tide remains above mean sea level more than half the time, but departs farther from mean sea level in a negative rather than in a positive direction. At Honolulu, Hawaii, the predicted tide is below the mean sea level more than half the time and positive departures are larger than negative departures. (Moore-SRC)
W82-02982

2C. Snow, Ice, and Frost

LAND SURFACE AND LAKE STORAGE DURING SNOWMELT RUNOFF IN A SUBARCTIC DRAINAGE SYSTEM,

Saskatchewan Univ., Saskatoon. Dept. of Geography.
J. E. FitzGibbon, and T. Dunne.
Arctic and Alpine Research, Vol 13, No 3, p 277-285, August, 1981. 4 Fig, 3 Tab, 12 Ref.

Descriptors: *Snowmelt, *Subarctic zone, *Drainage area, *Daily hydrographs, *Surface runoff, Lakes, Runoff plot, Runoff, Watersheds, Hydrographs, Seasonal storage, Surface water, Surface drainage, Topology, Topography, Knob Lake basin, Quebec.

The hydrographs of the inflow, outflow and storage capacity of the snowmelt runoff channels of the Knob Lake Basin at Schefferville, Quebec were studied. This basin is characteristic of the complex but glacially deranged drainage systems of the Canadian Subarctic Lowlands. Lake hydrographs were taken by measuring lake storage and discharge directly for each of the lakes in the study area, while discharge hydrographs for the land surface element were determined mathematically through a water balance equation. The land surface elements were the most important component of the Knob Lake Basin drainage system due to the large storage capacity (5-15 cm) on the land surface and the 3 to 4 day delay of the runoff from the land surfaces. The hydrograph that resulted reflected seasonal rather than daily patterns in response to snowmelt runoff. (Geiger-FRC)
W82-02624

THE MASS BALANCE OF PEYTO GLACIER, ALBERTA, CANADA, 1965 TO 1978,

Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
G. J. Young.
Arctic and Alpine Research, Vol 13, No 3, p 307-318, August, 1981. 6 Fig, 2 Tab, 17 Ref.

Descriptors: Topography, *Hydrologic budget, *Glaciohydrology, Glacier balance, *Glacier mass balance, Mathematical studies, Ablation, Snowmelt, Glaciers, Seasonal variation, Elevation, Meteorological data collection, Annual distribution, Accumulation, Snowline, *Peyto Glacier, Alberta.

Water, ice and heat mass balance records for Peyto Glacier, Alberta for 1965 to 1978 were examined as a continuation of the studies begun during the International Hydrological Decade and International Hydrological Program. Over the entire period studied, a specific loss in mass of 0.21 m/

year water equivalent was noted, while on a year-to-year basis, slightly positive or negative balances were recorded. Both accumulation and ablation patterns were repeated yearly over short distances of the glacier, but repetitive patterns were unusual on a larger scale. Different combinations of summer ablation and winter accumulation may achieve the same net annual balance. On moderately sloping glaciers such as Peyto, the health of the glacier may be determined by the position of the transient snowline. Some relations between the net annual balance and the meteorology of the area are also discussed. (Geiger-FRC)
W82-02638

MICROWAVE MEASUREMENTS OF SNOWPACK PROPERTIES,

Kansas Univ./Center for Research, Inc., Lawrence.
W. H. Stiles, F. T. Ulaby, and A. Rango.
Nordic Hydrology, Vol 12, No 3, p 143-166, 1981. 10 Fig, 2 Tab, 44 Ref.

Descriptors: Snowpack, *Microwaves, Field tests, Remote sensing, Scattering coefficient, Water content, *Snow water equivalent, Colorado.

Active and passive microwave responses to snow parameters were measured during the winter of 1977 to correlate the data with changing snowpack properties. The study area was a hayfield near Steamboat Springs, Colorado. The three types of measurements were: temporal (daily, morning and afternoon over 6 weeks), diurnal, and snowpile (to determine the effects of piling up snow to 170 cm in 20 cm increments). The scattering coefficient and the apparent radiometric temperature were sensitive to changes in snow water equivalent and liquid water content. The scattering coefficient showed an exponential-like increase with increasing water equivalent, and the readiometric temperature, an exponential-like decrease. Increasing liquid water in the snowpack caused a decrease in scattering coefficient and an increase in radiometric temperature. These minima and maxima were seen at 4 pm, as measured by the diurnal data sets. The snow water equivalent at which the microwave response began to saturate decreased with decreasing wavelength. The scattering coefficient and radiometric temperature variations were greatest at 35 and 37 GHz, and much less at lower frequencies. This paper also reviews methods of measuring snow water equivalent and liquid water content by manual means and by microwave methods. Three basic techniques are available; bistatic reflection-coefficient measurements, measurements of snow vertical stratigraphy using high range resolution radar, and measurements of the backscattering coefficient. (Cassar-FRC)

QUANTITATIVE COMPOSITION, DISTRIBUTION, COMMUNITY STRUCTURE AND STANDING STOCK OF SEA ICE MICROALGAE IN THE CANADIAN ARCTIC,

Department of Fisheries and Marine Service, Ste Anne De Bellevue (Quebec). Arctic Biological Station.
S. I. C. Hsiao.
Arctic, Vol 33, No 4, p 768-793, December, 1980. 2 Fig, 5 Tab, 65 Ref.

Descriptors: *Sea ice, *Microorganisms, Algal growth, *Algae, Arctic, Polar regions, *Arctic zone, Microbiological studies, Canadian Arctic.

The quantitative composition, vertical distribution and standing stock of microalgae in Canadian arctic sea ice were investigated, and some environmental factors controlling their distribution were explored. A total of 196 species in 46 genera of microalgae was identified from the Canadian arctic sea ice. Among them the diatoms were represented by 189 species, the flagellates by 3, and the dinoflagellates and chrysophytes by 2 species each. No blue-green algae were found. Eleven, 24, and 44 species of microalgae were found exclusively in the Eskimo Lakes, Eclipse Sound and Frobisher Bay, respectively. The sea ice microalgal communities and standing stock started to develop in late fall at the time of ice formation. They grew very slowly through the winter months, increasing exponentially in early spring, reached a peak just prior to the thaw period in late spring or early summer, and declined during summer quite rapidly as the ice melting occurred. Standing stock was greatest at the bottom of the sea ice, where it was one to two orders of magnitude larger than in other parts of the ice column, and 50 to 500 times greater than in the phytoplankton in the underlying waters. The sea ice microalgae grew and spread in the continuously low temperature, variable salinities, and a quite remarkable set of light fields, together with spatially and temporally variable and discountinuous physical-chemical conditions. THE EFFECT OF WIND ON ICE PRESSURE ON RIVER STRUCTURES,

D. F. Panfilov.
Hydrotechnical Construction, No 3, p 284-289, March, 1980. 8 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 43-46, March, 1980.

Descriptors: *Ice pressure, *Hydraulic structures, *Wind velocity, Wind, Ice loads, Ice run, Estimating equations, Mathematical studies, Rivers.

The role of wind in the calculation of ice pressure on structures was explored. This depends primarily upon the relation between wind speed and current velocity. For ratios of wind speed over velocity that are less than 10 (free rivers and shallow impounded pools) the effects are small and can be ignored. For large reservoirs, the ratio is generally greater than 100 and affects the extent of the ice loads, especially during the spring ice run. Reduced equations are derived which can be used in the case of deep reservoirs with a ratio greater than 100. Movement of the ice cover in these reservoirs occurs to a considerable extent under the effect of wind. (Small-FRC)

ICE COVER EFFECTS ON STREAM FLOWS AND MIXING,

Canada Centre for Inland Waters, Burlington (Ontario).
Y. L. Lau, and B. G. Krishnappan.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY10, p 1225-1242, October, 1981. 12 Fig, 14 Ref.

Descriptors: *Ice cover, *Stream discharge, *Flow pattern, Mathematical studies, Turbulent flow, Flow velocity.

An alternate method was used to analyze flow structure in an ice covered stream. A turbulence model (Launder and Spalding) was used to calculate the depth, velocity distribution, the bed slope, and bottom roughness. Then these results were used in the two-dimensional mass transport equation to simulate concentration distributions due to sources placed at different heights in the flow. Three different fully developed flows were calculated for open water and ice covered conditons. The equivalent ice-covered flows had larger flow depths and smaller bed shears than the free-surface flows. The resulting eddy viscosity was smaller; however, it did not go to zero. When a neutrally buoyant tracer was computed for all runs, the distributions indicated reduced mixing rates in ice-covered flows when compared to open-water flows. (Small-FRC)

PRODUCTION STRATEGIES IN ANTARCTIC INLAND WATERS: PHYTOPLANKTON ECOPHYSIOLOGY IN A PERMANENTLY ICE-COVERED LAKE,

Department of Scientific and Industrial Research, Taupo (New Zealand). Freshwater Section.
W. F. Vincent.
Ecology, Vol 62, No 5, p 1215-1224, October, 1981. 5 Fig, 6 Tab, 32 Ref.

Descriptors: *Phytoplankton, *Ice cover, *Antarctic, Polar regions, Lakes. Lake ice, Primary productivity, Nutrients, Temperature effects, Light penetration.

The relative importance of light, temperature, and nutrient supply for strategies of primary production by antarctic phytoplankton was examined experimentally in Lake Fryxell, a relatively productive water in the Taylor Valley (South Victoria Land). The lake is permanently covered by 3.8-4.6 m of ice and is 7 sq km in area. Three distinct layers of algal production were distinguished. Immediately under the ice, phytoplankton were adapted to relatively bright light and were limited by nitrogen availability. There was a deep maximum of Chroomonas and Pyramimonas at the bottom of the eutrophic zone in a highly shaded area. Mid-eutrophic populations continued to grow throughout midsummer. Nutrient supply seemed to determine lake-to-lake and depth variations in primary productivity when results from several lakes were compared. Low light rather than low temperature damped algal photosynthesis. (Small-FRC)

A SOLUTION TO SPRING ICE-JAM FLOODING,

J. C. Loffredo.
Public Works, Vol 111, No 3, p 82-83, March, 1980.

Descriptors: *Ice jams, *Ice breakup, *Flood control, *Flood protection, Flooding, Regional floods, Floodproofing, Streamflow, Streams, *Cazenovia Creek, Buffalo, New York.

To alleviate spring ice-jam flooding on Cazenovia Creek, the city of Buffalo employs three World War II vehicles (LVTs) to act as small ice breakers. To aid in the ice breaking efforts where dynamite has failed, track powered, amphibious LVTs were developed that could operate in only 5 feet of water. These modified vehicles are 27 feet long by 10 feet wide and can handle ice up to 2 feet thick. When used in conjunction with dynamite, the new LTVs can break ice up to 5 feet thick. Sometimes a large stationary ice field will cause flooding on Cazenovia Creek. The LVTs are used in breaking up the ice field before the heavy spring runoff to prevent the flooding before it has a chance to occur. Two of these new vehicles were used to break ice fields on Owasco Outlet, Port Byron, a non-navigable stream downstream from a dam whose reservoir was in danger of topping. During the Port Byron mission their lack of power and speed in reverse caused the LVTs to become stuck in the ice field. Federal grants are being sought to design new transmissions for the vehicles to overcome this problem. (Geiger-FRC)

2D. Evaporation and Transpiration

STOMATAL RESPONSE TO ENVIRONMENTAL VARIABLES IN TWO TROPICAL FOREST SPECIES DURING THE DRY SEASON IN NIGERIA,

Ibadan Univ. (Nigeria). Dept. of Forest Resources Management.
D. Whitehead, D. U. U. Okali, and F. E. Fasehun.
Journal of Applied Ecology, Vol 18, No 2, p 571-587, August, 1981. 10 Fig, 2 Tab, 30 Ref.

Descriptors: *Stomatal transpiration, *Water potentials, *Forest hydrology, Transpiration, Leaves, Teak, Gmelina, Trees, *Nigeria, Plant water potential, Tropical regions, Soil-water-plant relationships.

The stomatal responses of two fast-growing exotic trees of commercial value were determined as part of a study on prediction of transpiration rates. Gmelina arborea Roxb. is planted for pulpwood, and teak (Tectona grandis L.), for poles and saw timber. A null-balance diffusion porometer was used to measure stomatal conductance on 6 days during the dry season, January 1978, near Ibadan, Nigeria. In both species stomatal conductance increased rapidly in early morning from a low of 2.0-2.5 mm per sec and decreased after midday. Maxi-

mum Gmelina values (10-15 mm per sec) were less than those for teak (20-30 mm per sec). Generally, stomatal conductance increased with increasing irradiance and decreased with increasing air saturation deficit. Maximum conductances were at 400 and 800 micro Einstein per sq meter per sec in Gmelina and teak, respectively. Although temperature effects were not altogether clear, there was indication that conductances were higher at 20-28 C for Gmelina and 27-31 C for teak. There was no evidence that leaf water potential and conductance were related. Transpiration rates calculated from the Penman-Monteith equation using observed stomatal conductances and environmental variables agreed closely with transpiration rates calculated from conductances predicted by the Jarvis (1976) model. Mean hydraulic resistances were (in MPa per m): Gmelina, 6 million, and teak, 5.3 million. (Cassar-FRC)

THE IRRIGATION SCHEDULING PROBLEM AND EVAPOTRANSPIRATION UNCERTAINTY,

Massachusetts Inst. of Tech., Cambridge.
A. E. Rhenals, and R. L. Bras.
Water Resources Research, Vol 17, No 5, p 1328-1338, October, 1981. 11 Tab. 29 Ref.

Descriptors: *Evapotranspiration, *Model studies, Mathematical models, Consumptive use, *Irrigation practices, Irrigation, Crop yield.

The purpose of this paper is to present an optimization model for scheduling in which the natural uncertainty of potential evapotranspiration (PET) has been explicitly included. A hypothetical case study is presented in order to gain insight into the behavior of the global model, to determine its computational feasibility, and to provide an example of the effect of PET uncertainty on the measures of performance of irrigation scheduling. The model presented is based on stochastic dynamic programming and is formulated to maximize net benefits from a crop facing uncertain, correlated evapotranspiration demands. Weekly irrigation decisions are made after observing current soil moisture and available irrigation water, as well as PET during the past week. The model is similar to the traditional reservoir control algorithms popular in the surface water investigations. Although the model formulation is useful and feasible, the case study example points out that the effect of uncertain evapotranspiration on irrigation performance measures is apparently minimal. Computer programs used for this analysis are available. A major limitation of the global model was seen to be that the crop model utilized has not been field tested. (Baker-FRC)

RIVER AND SUSPENDED SEDIMENT DISCHARGE INTO BYAM CHANNEL, QUEEN ELIZABETH ISLANDS, NORTHWEST TERRITORIES, CANADA,

Pacific Geoscience Centre, Sidney (British Columbia).
P. McLaren.
Arctic, Vol 34, No 2, p 141-146, June, 1981. 6 Fig, 2 Tab, 14 Ref.

Descriptors: *Sediment transport, *Alluvial channels, Channels, Suspended sediments, Runoff, Catchment areas, Drainage, Arctic zone, Arctic, Alluvial deposits, Ice, Cold regions, *Northwest Territories, Canada.

River and suspended sediment discharge into Byam Channel, which intervenes between the eastern Melville and western Byam Martin islands in the Northwest Territory of Canada, was investigated during 1973 and 1974. There are 32 drainage basins on the two coasts, of which seven enter Viscount Melville Sound, three flow north into Byam Martin Channel, and the other 22 empty into Byam Channel. They range in size from 11 square kilometers to 1136 square kilometers, each basin discharging onto a delta that begins at the point where the river is no longer confined within valley walls and is characterized by a braided stream pattern. Continuous ice persists in Byam Channel for at least 9 months of the year. River sediments are frequently deposited on nearshore ice during breakup, resulting in a decreased albedo and a more rapid melting at the delta fronts. Flow and suspended sediment discharge were measured 15 times between 30 June and 1 August 1974. Stream flow began on 29 June. On 1 July discontinuous sand was being deposited on an ice stream bottom, and by 3 July the stream had cut down to the channel bottom. Peak discharge occurred on 10 July and by 16 July no snowbanks remained. From 30 June to 6 July suspended sediment concentration increased steadily with increasing discharge, peaking at 3.36 kg/cubic meter and dropping by 16 July to 0.44 kg/cubic meter. Much of the sediment is apparently not deposited in the channels, but rather is incorporated into the active delta fronts or possibly transported out of Byam Channel above a pycnocline. (Baker-FRC)

MODELING CIRCULATION IN DEPTH-AVERAGED FLOW,

San Diego State Univ., CA. Dept. of Civil Engineering.
V. M. Ponce, and S. B. Yabusaki.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1501-1518, November, 1981. 5 Fig, 15 Ref.

Descriptors: *Circulation, *Model studies, Mathematical studies, Turbulence, Flow, Hydrodynamics, Channels, *Open channels, Multiphase flow, Water circulation.

A fundamental investigation of the circulation phenomena in open channels is performed using a depth-average mathematical model. Circulation has been observed to have a primary influence on erosion and accretion processes, heat diffusion, and contaminant dispersion. Therefore, the clarification of the physical mechanisms leading to the generation of circulation in free surface flow is a much needed endeavor. The depth-averaged two-dimensional governing equation set is used as a basis for the development of a finite difference model employing a multi-operational procedure to advance the values of the dependent variables in time. Two geometric onfigurations are extensively tested regarding the mathematical model itself and the boundary conditions. It was found that proper modeling of the effective stresses is a necessary condition for the resolution of steady, closed-streamline circulation in depth averaged mathematical models. Additionally, a competition exists between convective inertia and bed resistance. Circulating flow is inhibited when bed resistance predominates. The type of boundary condition specification is found to have a significant effect in the resulting flow pattern. It is noted that the greatest source of uncertainty in such studies is the modeling of the effective stresses. It is surmised that a higher level of sophistication is needed to handle complex flow patterns. A separate account of the three components of the effective stresses may be warranted. At present, individual closure assumptions are not available. (Baker-FRC)

LOCAL FLOW ACCELERATIONS IN RIVERS,

Canterbury Univ. Christchurch (New Zealand). Dept. of Agricultural Engineering.
B. D. Van't Woudt.
Water Resources Bulletin, Vol 17, No 4, p 571-577, August, 1981. 7 Fig, 2 Tab, 8 Ref.

Descriptors: *Rivers, *Flow rates, *Alteration of flow, Flow characteristics, Fluctuations, Streamflow, Braided rivers, *New Zealand, Flow control, Roughness, Flow accelerations.

A field study of local flow accelerations in rivers was undertaken to provide background information for the control of many braided rivers in New Zealand. The study area was 3000 m x 800 m along the floodplain of the Waimakariri river. Flow accelerations were found to form sequentially on the downstream face of a bar across a channel when the bar approached a given water surface grade line. The bar formation occurred within a pattern of deep and shallow subreaches that can coincide with narrow and wide ones. Also, nonsequential flow accelerations can be induced by a bankslide or be formed through channel capture, channel abandonment, or channelslide deposits. Flow accelerations can be intensified through time, and can be obliterated by washout or sediment swamping. (Small-FRC)

CHANNEL FORM AND FLOW CHARACTERISTICS OF SUPRAGLACIAL STREAMS, AUSTRE OKSTINDBREEN, NORWAY,

Sheffield Univ. (England). Dept. of Geography.
A. D. Knighton.
Arctic and Alpine Research, Vol 13, No 3, p 295-306, August, 1981. 6 Fig, 1 Tab, 27 Ref.

Descriptors: *Streamflow, *Glacial streams, *Flow velocity, *Flow discharge, Rapid flow, Alluvial plains, Alluvial rivers, Flow pattern, Stream discharge, Topography, Water depth, Ablation, Glaciohydrology, Comparison studies, *Norway.

The characteristics of supraglacial streams and the similarity in behavior of these streams to those in alluvial environments were studied in three streams of the ablation area of Austre Okstindbreen, Norway. Two supraglacial streams were found to adjust their width and depth nearly equally but increase their velocity at the highest rate in response to a rapid downstream increase in discharge. A stream with a less regular pattern of downstream discharge showed similar width adjustments but different depth and velocity responses. The downstream relations of the first two streams differed from alluvial streams, showing responses which might be expected in the absence of declining slope and sediment load. Fluctuations in streamflow behavior were attributed in part to bed topography. The supercritical flow which aids in meander formation is related to the generation of traveling waves in one stream, with significant differences in wave frequency in various parts of the stream. LOW-FLOW FREQUENCY DATA FOR SELECTED STREAM-GAGING STATIONS IN FLORIDA,

Geological Survey, Tallahassee, FL. Water Resources Div.
G. H. Hughes.
Geological Survey Open-File Report 81-69 (WRI), 1981. 110 p, 17 Fig, 2 Ref.

Descriptors: *Low flow, Data collections, *Streamflow, *Flow rates, Frequency analysis, Average flow, Gaging stations, Sites, *Florida, Low-flow frequency, Recurrence interval.

This report contains tables of low-flow frequency data for 161 stream-gaging stations in Florida. The selected stations represent those having suitable flow records spanning 7 or more years. Flow values representing the annual minimum average flow for selected periods ranging from 1 to 183 days are presented for recurrence intervals ranging from 2 to 50 years. The low-flow frequency data of relatively short-term stations were adjusted where possible on basis of records of long-term stations to reduce the possible bias introduced by short-term climatic trends. SPACE-TIME VARIABILITY OF THE RUNOFF OF EUROPEAN RIVERS,

Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
A. K. Fomchenkov.
Water Resources (English Translation), Vol 7, No 6, p 500-509, November/December, 1980. 3 Fig, 3 Tab, 13 Ref. Translated from Vodnye Resursy, No 6, p 52-63, November-December, 1980.

Descriptors: *Water level fluctuations, *Rivers, *Correlation analysis, Mathematical studies, *Runoff, Hydrologic data collections, *Europe, Temperature effects, Stream flow, River basins.

Space-time variability of European rivers was studied using data on runoff collected at 89 gaging stations of which 50 have an observation period greater than 70 years. The change in correlation coefficients was analyzed as a function of the duration of the investigated runoff series. There were small variations of the correlation coefficients over the 60-year period, 1911-1970. This technique was used to isolate regions with synchronous variations, and 14 regions were determined using a minimum intraregional correlation greater than or equal to 0.4. To determine large territories with similar runoff variations, five areas with a positive runoff correlation were isolated on the basis of an analysis of the correlation matrix. When atmospheric circulation indices were studied, the maximum relation in 12 of the 14 regions was observed either with purely western circulation indices or with western circulation indices in combination with the southern circulation index. HYDRAULIC RESISTANCE OF FLOODPLAINS,

Odessa State Univ. (USSR).
Y. N. Sokolov.
Water Resources (English Translation), Vol 7, No 6, p 563-572, November/December, 1980. 3 Fig, 2 Tab, 24 Ref. Translated from Vodnye Resursy, No 6, p 143-154, November-December, 1980.

Descriptors: *Flood plains, *Flood flow, *Terrain analysis, *Roughness coefficient, Flow, Mathematical models, Vegetation effects, Topography, Hydrology, Hydraulic roughness, Hydraulic resistance.

Calculation of the roughness coefficient for floodplains and determination of the hydraulic resistance of floodplains are outlined. The hydraulic resistance determines the characteristics of flow and depends mainly on the standard deviations of averaged elevations in the direction of the flow. It also depends on functions characterizing the correlation between the elevations of the relief along the flow but averaged in a transverse direction. An example of such a description of a floodplain is presented. A statistical model of vegetation can be constructed by analogy with the representation of the floodplain relief as a random field of heights. The main dimensions of the plants depend upon whether they are single or multi-trunked. Data from aerial photographs and ground topography and botanical information can be used to construct parameters characterizing the roughness of relief and vegetation of a floodplain. (Small-FRC)

CALCULATION OF THE ANNUAL DISTRIBUTION OF RIVER RUNOFF WHEN OBSERVATION DATA ARE AVAILABLE,

Akademiya Nauk SSSR, Moscow. Inst. Vodnykh Problem.
E. G. Ivanov.
Water Resources (English Translation), Vol 7, No 6, p 510-515, November/December, 1980. 2 Fig, 1 Tab, 5 Ref. Translated from Vodnye Resursy, No 6, p 64-70, November-December, 1980.

Descriptors: *Water level fluctuations, Rivers, *Mathematical studies, Probability distribution, High water mark, Low water mark, Runoff, *USSR, *Streamflow, *Annual distribution.

A method which is a refinement of the standard Andreyanov technique for determining the annual distribution of river runoff is presented. The new method selects more than two high and low water periods during the year if this is appropriate. The available series of runoff observations is divided into annual time intervals starting from the wettest (driest) month according to long-term data. Empirical probability distribution curves are plotted, and month minima (maxima) and annual minima (maxima) are determined. The method was checked using water data, and good agreement was found. The method overcomes the problem of the Andreyanov technique which divided the years into common hydrologic periods and seasons, when the actual duration of hydrologic periods and seasons varies rather widely from year to year. The new method can give more accurate results. (Small-FRC)

STOCHASTIC HYDROLOGIC MODEL FOR DROUGHT MANAGEMENT,

Geological Survey, Reston, VA. Water Resources Div.
R. M. Hirsch.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 303-313, October, 1981. 5 Fig, 3 Tab, 6 Ref.

Descriptors: *Drought, *Streamflow forecasting, *Stochastic process, Model studies, Hydrologic models, Water supply, Reservoir storage, *Potomac River, Rivers, Forecasting, Risks, Water management.

The ARMA (1,1) cyclic stochastic flow model was used to produce long range water supply forecasts. It generates conditional cumulative distribution functions for monthly streamflow volumes and produces a set of equiprobable streamflow traces. With this information the conditional distribution functions of reservoir storage can be evaluated for a future month, and the probability of storage falling below a given level can be forecast. The 81-year streamflow record at Point of Rocks, Maryland, was used to illustrate the model. The ARMA (1,1) cyclic model was the best of a group of six models fit to the data. The second-ranking model was ARMA (1,0) cyclic. Four ARMA stationary models, fit using maximum likelihood estimation, were less satisfactory. (Cassar-FRC)

REGIONALIZATION AND PREDICTION OF ANNUAL FLOODS IN THE FRASER RIVER CATCHMENT, BRITISH COLUMBIA,

McMaster Univ., Hamilton (Ontario). Dept. of Geography.
P. Waylen, and M-K. Woo.
Water Resources Bulletin, Vol 17, No 4, p 655-661, August, 1981. 3 Fig, 20 Ref.

Descriptors: *Flood forecasting, *Mathematical studies, Flood control, Forecasting, *Fraser River Catchment, Canada, *British Columbia, Rivers.

A method is presented for predicting probability distributions of annual floods. The method is applied to the Fraser River catchment area of British Columbia. The technique of discriminant analysis provides a statistical distinction between two or more groups of basins affected by different flood generating processes such as snowmelt, glacier melt or rainfall. These groups are considered as hydrologic regions of differing flood characteristics. In this study discriminant functions are obtained using the means and standard deviations of the flood series, since both measures are related to the parameters alpha and beta of the Gumbel distribution. At the initial trial for regionalization, individual basins are assigned to different regions a priori, and the discriminant functions are computed using a program from the Statistical Package for

the Social Sciences. This program calculates the probabilities that a basin should be assigned to each of the a priori regions. The regions are thus reconstituted to obtain a new set of discriminant functions. Subsequently the basins are located on a map, and their disposition allows the regions to be delineated. The method was applied to the Fraser catchment, above the town of Hope, covering an area of 217,000 square kilometers. The two-parameter Gumbel distribution sufficiently described the annual floods of the selected rivers in this catchment. Through stepwise regression major climatic and physiographic variables can be identified in various regions, and the resulting equations successfully predict the flood characteristics for basins within the region. ESTIMATION OF CALCIUM SULFATE SOLUTION RATE AND EFFECTIVE AQUIFER SURFACE AREA IN A GROUND-WATER SYSTEM NEAR CARLSBAD, NEW MEXICO,
Geological Survey, Lakewood, CO.
H. C. Claassen.
Ground Water, Vol 19, No 3, p 287-297, May/June, 1981. 4 Fig, 5 Tab, 7 Ref.

Descriptors: *Calcium sulfate, *Solubility, *Aquifer characteristics, Hydraulic conductivity, Leakage, Pecos River, Lake McMillan, Brantley Dam, *New Mexico, Reservoirs, Geohydrology, Minerals, Dissolved solids, Recharge, Groundwater recharge, Gypsum, Anhydrite, Water quality, Chemical composition, Groundwater movement, Dam stability, Dam effects.

Leakage from Lake McMillan, New Mexico, has raised question about the ability of the proposed Brantley Dam, downstream, to hold water. These sites are in a region of evaporite facies, consisting mainly of gypsum and anhydrite. The formation has a large hydraulic conductivity, 2 million meters per day. Major recharge is from the Pecos River. The minimum amount of calcium sulfate being dissolved at present, about 6 millimol per liter, was calculated from differences in the chemical composition of the water recharging the system and the composition of the groundwater in the system. The total mass of calcium sulfate dissolving is 29 times 10 to the 10th power g per year (volume, 9900 cu m as anhydrite or 16,000 cu m as gypsum) at a minimum flow of 1.13 cu m per sec. All computations depend on the accuracy of the uncertain value of the equilibrium constant for gypsum. The estimated ratio of aquifer gypsum surface area to groundwater volume is very small, indicating that the hydraulic conductivity is secondary (fracture or conduit). These conduits widen at rates of a few tens of mm per year. If the Brantley Dam is built, changes in hydrology could result. The degree of change is dependendent on the location of the dam site, the quality of water impounded in the reservoir, effects of reservoir filling on hydraulic gradients, and the amount and distribution of calcium sulfate minerals in the currently unsaturated zone. This study cannot answer the question of whether potential increases in gypsum removal rate would threaten the stability of the Brantley Dam. (Cassar-FRC)

ATOLL ISLAND HYDROLOGY,
Nevada Univ. System, Reno, NV. Desert Research Inst.
S. W. Wheatcraft, and R. W. Buddemeier.
Ground Water, Vol 19, No 3, p 311-320, May/June, 1981. 6 Fig, 3 Tab, 26 Ref.

Descriptors: *Atolls, *Tidal effects, *Aquifer systems, Geohydrology, Groundwater movement, Model studies, Mathematical models, Enewetak Atoll, *Marshall Islands, Enjebi Island, Unconsolidated aquifers, Carbonate aquifers.

An important feature of atoll groundwater hydrology in the northern Marshall Islands is vertical coupling between the unconsolidated Holocene surface aquifer and an underlying, more permeable Pleistocene limestone aquifer at a depth of several tens of meters. Tidal lag, tidal efficiency, and water levels were measured in 24 wells, 1 to 90 m deep, on Enjebi Island on Enewetak Atoll. Hydraulic conductivity measurements were obtained from laboratory and field testing. Data were used in a model based on horizontal propagation of tidal signals. Results indicated that horizontal transport and tidal signal propagation were not operative in this region. This agreed with results from other atoll islands in the area. A simple mathematical model of groundwater dynamics based on the assumption of one-dimensional radial flow and tidal boundary conditions was developed. The implications of the vertical transport mechanism are: (1) fresh water reserves are more limited than predicted, (2) water reserves recover more quickly from overexploitation or contamination, (3) radionuclides are carried downward into the deeper aquifers instead of horizontally toward the sea, and (4) a deep transition zone with a high throughout of fresh and salt water may be important for rates and mechanisms of diagenetic changes in the sediments. (Cassar-FRC)

GEOELECTRIC SOUNDINGS FOR PREDICTING AQUIFER PROPERTIES,
Rhode Island Univ., Kingston. Dept. of Civil and Environmental Engineering.
W. K. Kosinski, and W. E. Kelly.
Ground Water, Vol 19, No 2, p 163-171, March/April, 1981. 5 Fig, 3 Tab, 39 Ref.

Descriptors: *Transmissivity, *Aquifer properties, *Resistivity, *Rhode Island, Electrical properties, Permeability, *Glacial aquifers, Aquifer characteristics.

A study was conducted to develop surface resistivity techniques for making quantitative estimates of the water transmitting properties of glacial outwash materials. Two bedrock valleys filled with glacial outwash material and located in the Pawcatuck River Basin, Rhode Island, were investigated with Schlumberger resistivity soundings. Data from previous pumping tests were also available. Resistivities for the different aquifer materials were derived with boring log control. The auxiliary point methods were used to reduce the aquifer layering to a single representative resistivity value. Electrical properties of individual layers within the aquifer cannot be obtained without bore hole control because of equivalence and suppression. The relation between normalized resistivity and permeability observed in this study is opposite to what has been observed in some earlier laboratory studies and is attributed in part to the high resistivity of the ground water. Relationships derived between aquifer hydraulic and electrical properties were applicable only to this area. However, the methodology is useful for other situations. (Cassar-FRC)

BOISE LOOKS UNDERGROUND FOR HEAT.
American City and County, Vol 95, No 8, p 59-61, August, 1980. 1 Fig, 1 Tab.

Descriptors: *Geothermal resources, *Heating, *Wells, *Boise, Idaho, Energy sources, Groundwater mining, Injection wells.

Geothermal water will be used to heat 1 million sq ft of space in commercial and municipal buildings in Boise, Idaho, after completion of a $16.1 million geothermal resources development project. The Warm Springs Water District and the Boise Water Corporation will drill seven production wells and extend and renovate present pipe systems. Wells will be 14 inches in diameter and about 1200 ft below the surface, with a planned production rate of 800-1500 gpm per well. Pumps will be continuous-duty vertical turbine pumps capable of operating with 170F water. The supply main will be 16 inches diameter preinsulated asbestos-cement pipe. The collection line, between 12 and 18 inches in diameter, will run parallel to the supply main to injection wells. Water will enter buildings at about 165F and leave at about 120F, providing 80% of total heating needs. Fixed operating costs will be $132,500 in 1982 and rise to $235,800 by 1990. Energy costs per therm (100,000 BTU) will be 28.1 cents in 1982, 38.1 cents in 1995, and drop to 29.2 cents in 2000 after debts are paid. (Cassar-FRC)

INTEGRAL EQUATION FORMULATION FOR GROUND-WATER FLOW,
Canterbury Univ., Christchurch (New Zealand).
B. Hunt, and L. T. Isaacs.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY10, p 1197-1209, October, 1981. 8 Fig, 10 Ref.

Descriptors: *Groundwater movement, *Estimating equations, *Porous media, Flow velocity, Computers, Mathematical studies.

An alternative integral equation formulation for the two-dimensional mixed problems of groundwater flow was investigated. This formulation yields a simultaneous set of integral equations with boundary values of the velocity potential and the stream function as unknowns. This method, based on the Cauchy integral theorem, can be used in a general purpose computer program for the analysis of multizone, anisotropic, two-dimensional flows in porous media. The formulation is simple and compact and leads to a well-conditioned set of equations. It allows nodes to be closely spaced in the region of singularities. The computer program has many practical applications. (Small-FRC)

ANALYSIS OF PUMPING TEST DATA USING MARQUARDT ALGORITHM,
Indian Inst. of Tech., New Delhi. Dept. of Civil Engineering.
S. Chander, P. N. Kapoor, and S. K. Goyal.
Ground Water, Vol 19, No 3, p 275-278, May/June, 1981. 2 Tab, 6 Ref.

Descriptors: *Marquardt algorithm, *Aquifer characteristics, *Pumping tests, Algorithms, Groundwater movement, Mathematical studies, Drawdown, Leaky aquifers, Graphical analysis, Transmissivity.

The Marquardt algorithm was the best method of estimating aquifer parameters from pump test data in a comparison of several methods. The residual square error was smaller than that obtained by known methods: theis curve, Jacob, Chow, and Kirz for nonleaky aquifers, and Hantush I, Walton's curve, and Rushton's discrete numerical model for leaky aquifers. The Marquardt algorithm is not sensitive to initial estimates, and convergence is fast. This method also avoids the subjectivity of the conventional graphical techniques. (Cassar-FRC)

GROUNDWATER SYSTEMS ASSOCIATED WITH SECONDARY SALINITY IN WESTERN AUSTRALIA.
Western Australia Dept. of Agriculture, South Perth. Div. of Resource Management.
R. A. Nulsen, and C. J. Henschke.
Agricultural Water Management, Vol 4, No 1/3, p 173-186, 1981. 7 Fig, 3 Tab, 41 Ref.

Descriptors: *Salinity, *Groundwater, *Surface-groundwater relations, *Australia, Soil properties, Salts, Hydrology, Water pollution sources, Groundwater movement, Aquifer characteristics, Geochemistry.

The Western Australian landscape is characterized by a peneplain developed by subaerial weathering of Archean rocks. Except on the margins of the peneplain, surface drainage is limited to a series of interconnected salinas, and subsurface drainage is restricted by a relatively shallow, impermeable

bedrock and an absence of sedimentary aquifers. The simplest model of a catchment consists of an intake area, a flow path and a discharge area. Information currently available about each of these three major components is reviewed. Skeletal soils often are present immediately below rock outcrops, and it is supposed that these areas are recharge zones for the confined aquifer in the Belka Valley. Relatively high infiltration rates measured in the upper pediments indicate that these areas may act as preferential intake areas for the seepages that occur downslope. The flow path in most of the groundwater systems in Western Australia consists of a shallow unconfined aquifer and a deeper semi-confined aquifer. The thickness of the aquifers varies with the surface topography and contours of the bedrock. In most cases the length of the flow path is much greater than the thickness. Only a few measurements have been made of the transmission characteristics of aquifers associated with land and stream salinity in Western Australia. The discharge of saline water from the groundwater system can take place either by flow into a stream system or by capillary rise and subsequent evaporation from the soil surface. Subsurface water flow in discrete channels in the discharge area is a common observation. The occurrence of secondary soil salinity is usually associated with a rise in the level of the water table, and only by reversing the trend and significantly reducing the level of the water table can any amelioration of surfce salinity be achieved. GROUND-WATER RECHARGE FROM RECTANGULAR AREAS,

Indian Agricultural Research Inst., New Delhi (India). Water Technology Center.
N. H. Rao, and P. B. S. Sarma.
Ground Water, Vol 19, No 3, p 271-274, May/June, 1981. 2 Fig, 8 Ref.

Descriptors: *Water table profiles, *Confined aquifers, *Groundwater recharge, Aquifers, Unconfined aquifers, Prediction, Equations, Groundwater mound profiles.

An analytical solution for the formation of groundwater mounds beneath rectangular recharge areas for finite aquifers has been developed. Data of Bianchi and Haskell (1975) for the same situation in infinite aquifers was used in the equation after fixing boundaries at large, but finite, distances. The predicted groundwater mound profiles generally agree well with the observed profiles. During initial recharge (5.15 days) the predicted profile is above the observed profile at all distances from the center to the limit studied, 300 ft. At higher values of time (25 days) and distances close to the center (0.175 ft) the predicted profile is lower than the observed profile. At higher values of time (25 days) and distances greater from the center (175-300 ft) the predicted profile is slightly higher than the observed profile. The Glover equation for infinite aquifers gives results about a foot higher than observed values under all conditions of time and distance from the center. Differences between profiles obtained from the method developed in this paper and the observed profiles are on the order of 0.5 ft. (Cassar-FRC)

PROBABLE HIGH GROUND-WATER LEVELS IN MASSACHUSETTS,

Geological Survey, Boston, MA. Water Resources Div.
M. H. Frimpter.
Geological Survey Open-File Report 80-1205 (WRI), March, 1981. 19 p, 12 fig, 1 Tab, 7 Ref.

Descriptors: Groundwater, *Water table, *Observation wells, Water level fluctuations, Estimating, *Massachusetts, *Groundwater level.

Water-level records from an observation-well network are analyzed for utility in estimating probable high ground-water levels in three different geohydrologic environments in Massachusetts. Analyses were made of 83 observation wells with between 8 and 37 years of records. Maximum annual water levels occur most frequently in March and April. The maximum range of water levels equaled or exceeded at 10 percent of randomly selected sites is estimated to be 16 feet in till, 9.2 feet in sand and gravel on terraces, and 4.0 feet in sand and gravel in valleys. An approach to estimating probable high ground-water levels at construction sites is suggested. An estimate of the high water level at a site may be derived by solving the proportion in which the ratio of the potential water-level rise at a test site to the potential water-level rise at an observation well is equal to the ratio of the water-level range at the site to the historic water-level range at an observation well in a similar geohydrologic environment. Precise description of the probabilities of exceedence of estimates made by this approach with the data available has not been made. Assuming that the data are representative of the future, estimates would not be expected to be exceeded at more than 1 in 10 sites over a period of 10 years or longer. (USGS)

DIGITAL-MODEL SIMULATION OF THE HYDROLOGIC FLOW SYSTEM, WITH EMPHASIS ON GROUND WATER, IN THE SPOKANE VALLEY, WASHINGTON AND IDAHO,

Geological Survey, Tacoma, WA. Water Resources Div.
E. L. Bolke, and J. J. Vaccaro.
Geological Survey Open-File Report 80-1300 (WRI), 1981. 43 p, 16 Fig, 21 Ref.

Descriptors: *Mathematical models, *Groundwater, Flow system, *Aquifer, Aquifer characteristics, Wells, Hydrologic data, Geohydrology, Precipitation, Evapotranspiration, Pumping, *Groundwater movement, Water level fluctuations, Hydraulic conductivity, Surface-groundwater relations, *Washington, *Idaho, Spokane Valley.

A digital-computer model of the hydrologic flow system, with emphasis on ground water, was developed for the Spokane Valley, Washington and Idaho. The current rate of ground water pumping has little effect on water levels in the Spokane aquifer, although short-term water-level declines occur locally. The model was used to show the effects of increased ground-water pumping on aquifer heads and streamflow. Increasing the pumping rates, by a factor of 2 from the 1977 rates, lowered water levels in the Spokane aquifer less than 3 feet during a 1-year simulation. Doubling the ground-water pumping caused a decrease in discharge of the Spokane River, as measured at Spokane, of about 150 cubic feet per second during the summer months and about 50 cubic feet per second during the rest of the year. The leakage from the aquifer to the Little Spokane River was decreased by less than 10 cubic feet per second by doubling the ground-water pumping. (USGS)

GROUND-WATER APPRAISAL OF SAND PLAINS IN BENTON, SHERBURNE, STEARNS, AND WRIGHT COUNTIES, CENTRAL MINNESOTA,

Geological Survey, St. Paul, MN. Water Resources Div.
G. F. Lindholm.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $28.75 in paper copy, $5.50 in microfiche. Geological Survey Open-File Report 80-1285 (WRI), 1980. 103 p, 49 Fig, 4 plates, 12 Tab, 32 Ref.

Descriptors: *Groundwater, *Aquifers, *Groundwater availability, *Aquifer charcteristics, Sand aquifers, Groundwater recharge, Precipitation, Surface-groundwater relations, Irrigation, Drawdown, Water yield, Water quality, Lithologic logs, Hydrologic models, Mathematical models, Forecasting, *Minnesota, Benton County, Sherburne County, Sterns County, Wright County.

Surficial-sand aquifers in 960 square miles of central Minnesota were studied to determine the occurrence, availability, and suitability of the surficial aquifer as a source of water. The aquifer, which is being increasingly developed for irrigation, is predominantly medium to course sand with lesser amounts of gravel. Saturated-sand aquifers in the Maine Prairie area locally exceed 100 feet in thickness, and transmissivity exceeds 40,000 feet squared per day. Similar valley-fill deposits in Sherburne County exceed 80 feet in thickness, transmissivity exceeds 30,000 feet squared per day, and expected well yields are from 2,000 to 3,000 gallons per minute. Water is of the calcium bicarbonate type and suitable for most uses. Relatively high nitrate and chloride concentrations occur in a heavily irrigated area in Sherburne County. Surficial aquifers in Sherburne County and the Maine Prairie area of Stearns county were simulated by two-dimensional digital ground-water flow models. Both modeled areas will support additional withdrawals, but caution must be exercised because lowering ground-water levels will also lower the lake levels and reduce streamflow. In some areas, aquifer dewatering will reduce individual well yields. (USGS)

POTENTIOMETRIC SURFACE MAPS OF THE SPARTA SAND: NORTHERN LOUISIANA AND SOUTHERN ARKANSAS, 1900, 1965, 1975, AND 1980,

Geological Survey, Alexandria, LA. Water Resources Div.
G. N. Ryals.
Geological Survey Open-File Report 80-1180, August, 1980. 1 Sheet.

Descriptors: *Maps, *Potentiometric level, *Groundwater, *Aquifers, Contours, Wells, Water level, Pumping, *Louisiana, *Arkansas, Sparta Sand.

The potentiometric surface of the Sparta Sand in northern Louisiana is shown by contours on four maps. Maps for 1900, 1965, and spring 1975 are generalized, small-scale maps from previously published reports. The spring 1980 map (1:500,000) is based on measurements in 144 wells and includes the southern tier of counties in southern Arkansas. The map shows regional effects of pumping from the Sparta Sand and effects of local pumping centers at Magnolia and El Dorado, Ark., and at Minden, Ruston, Jonesboro-Hodge, Winnfield, Bastrop, and in the Monroe area of Louisiana. RADIOTRACER EVALUATION OF GROUNDWATER DISPERSION IN A MULTI-LAYERED AQUIFER,

Southern Universities Nuclear Inst., Faure (South Africa). Atomic Energy Board Isotope Unit.
B. R. Meyer, C. A. R. Bain, A. S. M. De Jesus, and D. Stephenson.
Journal of Hydrology, Vol 50, No 1-3, p 259-271, March, 1981. 7 Fig, 1 Tab, 4 Ref.

Descriptors: *Tracers, *Saline water intrusion, Groundwater movement, Iodine radioisotopes, Aquifers, Model studies, Nuclear powerplants, Cape Town area, *South Africa.

In order to assess the possibility of seawater permeating inland to the foundations of the Koeberg Nuclear Power Station near Cape Town, South Africa, the groundwater flow conditions were investigated. The dispersion coefficient of the sandy aquifer had to be determined in order to model the effect of dispersion across the seawater/fresh groundwater interface. Iodine-131 was used as a tracer to obtain the dispersion coefficient and the velocity of fresh groundwater. A mathematical model was developed to describe the groundwater flow and intermixing in several layers. The largest effect on dispersion was due to the different flow speeds of water in the different layers. (Cassar-FRC)

RADIOCARBON DATING OF GROUNDWATER OF THE AQUIFER CONFINED IN THE LOWER TRIASSIC SANDSTONES OF THE LORRAINE REGION, FRANCE,

Paris Univ., Thonon-les-Bains (France). Center for Geodynamic Research.
B. Blavoux, and P. Olive.
Journal of Hydrology, Vol 54, No 1-3, p 167-183, December, 1981. 10 Fig, 11 Ref.

Descriptors: *Groundwater dating, *Aquifer characteristics, *Radioactive dating, Groundwater, Radiochemical analysis, Sandstones, Isotope studies, *Lorraine, *France.

An isotopic study was carried out on groundwater trapped below a confining bed to determine the tritium, radiocarbon, 13-C, 18-O, and deuterium contents of the aquifer confined in the Lower Triassic sandstones of the Lorraine Region of France. Using 40 boreholes, samples were collected and the temperature, pH, alkalinity, and total dissolved carbon were determined. In the laboratory, the major elements were estimated: 3-H, 18-O, 2-H, 13-C, and 14-C. A significant relationship was determined between total dissolved carbon and 13-C, which indicated a gradual enrichment of the total dissolved carbon with 13-C resulting from the escape of dissolved CO2. The stable isotope study indicated two water families. The radiometric rates were lower than rates calculated by means of current hydraulic parameters. This makes the hypothesis of a permanent flow regime questionable. (Small-FRC)

A METHOD OF PERFORMING RESPONSE TESTS ON HIGHLY PERMEABLE AQUIFERS,

Department of the Environment, Edmonton. Div. of Earth Sciences.
D. W. Prosser.
Ground Water, Vol 19, No 6, p 588-592, November/December, 1981. 4 Fig, 1 Tab, 5 Ref.

Descriptors: *Hydraulic conductivity, *Aquifer testing, Permeability, Groundwater movement, Pressure head.

Electronic pressure transducers and pneumatically induced head differences were used to accurately measure response time in small diameter (2 inch) standpipes under conditions of very high hydraulic conductivity. Values of hydraulic conductivity obtained in nine tests using three types of slugs were as follows: solid plastic slug, 0.0053 cm per sec; water slug, 0.0076-0.012 cm per sec; and pneumatic, 0.018-0.021 cm per sec. Response times in seconds ranged from 26 with the solid slug to 6.5 in the pneumatic method. The procedure relies on increasing air pressure in the standpipe to displace the water column. Then the air pressure is suddenly released and the head difference measured. Data can be recorded digitally or by analog chart recorder with fast paper speed. Time lags down to 1.6 sec, corresponding to a hydraulic conductivity of 0.1 cm per sec, have been measured successfully. The inertia of the air and water columns and well losses at the screen put a practical upper limit on the system. (Cassar-FRC)

DETERMINATION OF AQUIFER PARAMETERS FROM LARGE-DIAMETER DUG WELL PUMPING TESTS,

Institute of Geological Science, Wallingford (England).
R. Herbert, and R Kitching.
Ground Water, Vol 19, No 6, p 593-599, November/December, 1981. 7 Fig, 1 Tab, 6 Ref.

Descriptors: *Transmissivity, *Pumping tests, *Aquifer testing, Hydraulic conductivity, Dug wells, Shallow wells, Wells, Partially penetrating wells, Anisotropy, Model studies, Groundwater movement, Drawdown, Water level, *Aquifer characteristics.

Transmissivities of aquifers were determined in dug wells by recovery to 50% and 90% of the maximum drawdown levels. These two methods were developed using a digital model to simulate flow to a partially penetrating large-diameter well. In the 50% test a well is pumped for an hour and the time to recover to the 50% level is noted. Transmissivity is predicted using a given equation. Transmissivity may be in error, high or low, by a factor of 2. Longer pumping times produce more accurate results. In the 90% test the well is pumped for a period of time, and a shape factor is obtained from a graph, knowing the aquifer and well dimensions. The slope of the recovery at 90% recovery level is read from a plot of log drawdown against time. These figures are used in an equation to calculate hydraulic conductivity. Variations are given to account for vertical anisotropy. Neither of these methods can be used if there are nearby hydrogeological boundaries to flow. The recovery test methods are illustrated in two examples. In the second case transmissivity is deduced from both the 50% and the 90% methods (8.4 sq m per day) and the anisotropy determined, 2.8. (Cassar-FRC)

INFLUENCE OF HEAT DISPERSION ON STEADY CONVECTION IN ANISOTROPIC POROUS MEDIA,

Oslo Univ. (Norway). Dept. of Mechanics.
P. A. Tyvand.
Journal of Hydrology, Vol 52, No 1/2, p 13-23, June, 1981. 13 Ref.

Descriptors: *Convection, *Conduction, *Heat transfer, *Thermal conductivity, *Porous media, Capillary water, Permeability, Anisotrophy, Boundaries, Boundary conditions, Flow, Buoyancy, Mathematical studies.

A theoretical investigation of heat dispersion on steady buoyancy-driven convection is described. Buoyancy-driven convection in fluid-saturated porous layers has important applications in insulation techniques and flows in soils, snow layers, and oil reservoirs. This type of flow is primarily caused by vertical density gradients. In the investigation, hydrodynamic dispersion was taken into account at small Peclet numbers. An amplitude expansion was applied to solve the nonlinear problem, and the solution to the second order in the amplitude expansion and in the ratio of grain diameter to layer depth was found. Results of the investigation indicate that uniform basic flow does not influence the Nusselt number to the second order. The combination of anisotropy and dispersion effects may have profound influence on the heat transfer through a porous layer. This influence is believed to be stronger than the individual effects, due to the nonlinear character of the phenomena. (Titus-FRC)

A GEOCHEMICAL METHOD OF DETERMINING DISPERSIVITY IN REGIONAL GROUNDWATER SYSTEMS,

Texas Tech Univ., Lubbock. Dept. of Geoscience.
W. W. Wood.
Journal of Hydrology, Vol 54, No 1-3, p 209-224, December, 1981. 7 Fig, 28 Ref.

Descriptors: *Aquifer characteristics, *Geochemistry, *Groundwater movement, Aquifers, Groundwater reservoirs, Flow, Solutes, Dispersants, Dispersion.

Some easily obtained chemical observations of natural aquifer systems are used to determine numerical values for dispersivity that are regionally valid. The aquifer system is viewed as a large imaginary column, and analysis of hydrodynamic dispersion is made by observing the relative positions of solute contours in space. Curves relating concentration contour and pore volume of fluids are compared to theoretically developed curves. When a conservative solute is used, a true value of dispersivity is yielded, but the use of reacting solutes limits the separation of mechanical mixing from that caused by inhomogeneity of reaction sites. PREPARATION OF FRIABLE AQUIFEROUS SPECIMENS,

Humphreys (Howard) and Partners, Reading (England).
P. F. Worthington.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY2, p 333-337, February, 1980. 2 Fig, 7 Ref.

Descriptors: *Sample preparation, *Sediments, Cores, Soil water, Sample preservation, *Aquifer characteristics, Sedimentary rocks, Sedimentary petrology, Petrology, Petrography, *Groundwater availability.

Laboratory examination of granular aquifer specimens plays an important role in groundwater resource evaluation. Previous studies had not yielded a suitable method for examining the effective porosity, specific yield, and intergranular permeability of loosely consolidated sedimentary strata without destruction of the specimen. As part of regional groundwater resource evaluation program, a procedure was developed for preparing friable limestone and sandstone specimens from the Kalahari Basin. Cubic specimens with a linear dimension up to 37 mm were cut with a diamond-bladed saw, minimizing the application of water. Before saturation studies were attempted, the specimens were cast in a retaining medium, making sure to avoid contaminating the opposite pair of faces which were to remain exposed. The optimum mixture was found to represent a 10:4:1 ratio of epoxy resin, kaolin filler and hardener. Specimens were mounted in cylindrical perspex rins in two phases. Mounted specimens could be readily fixed into permeameter cells for measurement of permeability and electrical resistivity. Except for the invasion zone (from about 0.5 mm in less permeable samples to about 1 mm in the more permeable samples) the specimen is preserved in the same state as in the original core sample. No loss of specimens took place by disintegration during saturation, flushing and drying or due to uncontrolled contamination by the casting mixture. If necessary, the invasion zone can be measured following completion of all petrophysical measurements by slicing through the specimen perpendicular to the cell axis. The optimum casting mixture may vary for different rock formations. (Baker-FRC)

2G. Water In Soils

COUPLED HEAT AND WATER FLOWS AROUND BURIED CABLES,

Geotechnical Consultants, Inc., San Francisco, CA.
O. N. Abdel-Hadi, and J. K. Mitchell.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No GT11, p 1461-1487, November, 1981. 20 Fig, 20 Ref.

Descriptors: *Temperature effects, *Soil water, *Electrical equipment, Soil types, Flow, Mathematical studies, Buried cables.

A field test program was designed to provide a basis of comparison between predicted and actual values of moisture and temperature distributions in a study of the transient flow of water in unsaturated soils under thermal gradients. The Philip and DeVries theory was used. A theoretical analysis of moisture movement and important parameters associated with it indicated that the most important parameters were cable temperature and soil type. Gravitational flow, surface evaporation, and isothermal diffusion effect moisture changes in the backfill and are primarily responsible for early changes of moisture content in the trench backfill. There was excellent agreement between measured and predicted temperature contours up to 40 days and good agreement between contours from 40 days to 100 days. (Small-FRC)

AN ANALYSIS OF AREAL INFILTRATION CONSIDERING SPATIAL VARIABILITY,

Commonwealth Scientific and Industrial Research Organisation, Wembley (Australia). Div. of Mathematics and Statistics.
R. A. Maller, and M. L. Sharma.
Journal of Hydrology, Vol 52, No 1/2, p 25-37, June, 1981. 6 Fig, 18 Ref.

Descriptors: *Infiltration, *Groundwater movement, *Fluctuations, *Frequency distribution, *Statistical methods, Seepage, Prediction, Forecasting, Projections, Monte Carlo method, Mathematical models, Model studies, Soil water.

A direct mathematical procedure for studying the effect of spatial variability on areal infiltration flux and average ponding time is presented. This procedure requires less computer time than conventional Monte Carlo simulation and produces results which are free of sampling errors. The distributions of infiltration flux and of time to ponding are derived. These calculations assume bivariate normality of the log of sorptivity and a parameter from the Philips equation. Under the assumption that the parameters were normally distributed rather than lognormal, the expected infiltration was not significantly different, although the standard deviation was increased. SPATIAL AND TEMPORAL OVERLAP IN LAKE PHYTOPLANKTON COMMUNITIES,

Ottawa Univ. (Ontario). Dept. of Botany.
D. Wall, and F. Briand.
Archiv fur Hydrobiologie, Vol 88, No 1, p 45-57, February, 1980. 5 Fig, 2 Tab, 38 Ref.

Descriptors: Nutrients, Species diversity, Eutrophication, Niches, *Ecological effects, Plankton, Water pollution effects, Lakes, Nitrogen, Phosphorus, Algal growth, *Phytoplankton, Aquatic animals, Temporal distribution, Water depth, Species composition, *Heney Lake, *Quebec.

Field studies of niche overlap in enclosed lake phytoplankton communities were conducted in Heney Lake, Quebec, from June to November, 1976. Planktonic communities studied were enclosed in four polyethyelene tubes, each 1 m in diameter and 10 m deep, two of which were freely connected with sediments while the others were sealed at the bottom. In each set of containers, one was enriched with N and P, while the other was not. Phytoplankton densities and species composition were monitored weekly at 0, 3, 6, and 9 m. Overlap in depth was determined quantitatively, while overlap in time was calculated on the basis of presence and absence data within each water column over the 5 month period. Results showed that depth played a major role in separating the dominant species, while partitioning of dominant species' niches by time periods was of little importance. Addition of nutrients generally decreased niche overlap, probably due to increased interspecific competition. Fragilaria crotonensis and Synedra delicatissima expanded their niches in the presence of N and P nutrients and were regarded as superior exploitive competitors. The relationships of eutrophication to reduced diversity and niche overlaps are discussed. (Geiger-FRC)

CHIRONOMIDAE (DIPTERA) OF BALDWIN LAKE, ILLINOIS, A COOLING RESERVOIR,

Southern Illinois Univ. at Carbondale. Dept. of Zoology.
R. B. Parkin, and J. B. Stahl.
Hydrobiologia, Vol 76, No 1/2, p 119-128, 1981. 2 Fig, 8 Tab, 32 Ref.

Descriptors: *Cooling ponds, *Midges, *Temperature effects, Reservoirs, Ponds, *Baldwin Lake, Illinois, Benthos, Powerplants, Lake sediments.

The effects of water temperature and sediment type were studied on the composition, distribution, and abundance of the chironomid fauna of Baldwin Lake, which is a relatively shallow, rectangular lake with a very regular shoreline consisting largely of levees, and a small watershed. The watershed area is only about 0.7 times the lake area, and it is estimated that is supplies only about one-third of the water in the lake. The lake is a closed-cycle cooling reservoir for a power plant. Samples were taken monthly to semi-monthly for one year at four stations, two in the discharge channel and two in the main basin. Twenty-four species were collected. The annual mean population density was less than 100 larvae per square meter in the channel, and 1037/square meter in the main basin. Three species of Tanypodinae formed over 96% of the larval population in the main basin: Tanypus stellatus, Procladius bellus, and COeflotanypus concinnus. Principal species found on multiple plate samplers were Dicrotendipes nervosus, Gluptotendipes lobiferus, and Parachironomus monochromus. Chironomids were virtually eliminated from the channel at temperatures over 35 degrees C. The numbers of generations of T. stellatus were increased from the usual two to four in the main basin at temperatures of 32 degrees C. The sediments in Baldwin Lake were coarse-grained and low in organic carbon. (Baker-FRC)

THE INFLUENCE OF FLATWORM PREDATION ON ZOOPLANKTON INHABITING SMALL PONDS,

Concordia Univ., Montreal (Quebec). Dept. of Biology.
E. J. Maly, S. Schoenholtz, and M. T. Arts.
Hydrobiologia, Vol 76, No 3, p 233-240, 1980. 1 Fig, 6 Tab, 23 Ref.

Descriptors: *Predation, *Shallow water, *Feeding rates, Daphnia, Invertebrates, Ponds, *Zooplankton, Aquatic life, Population dynamics, *Flatworms, Mesostoma, Colorado.

Predation of a predatory flatworm, Mesostoma ehrenbergii, on zooplankton was studied in laboratory beakers, 30 liter tubs, and small shallow ponds at Mexican Cut, western Colorado. The beaker tests in 1977 revealed that M. ehrenbergii consumes Daphnia at a high rate, fairy shrimp (Branchinecta) at a low rate, and does not consume Diaptomus. The tub tests (1978) showed that the predation rate is correlated with surface to volume ratio of the containers. Feeding rates in 8 natural ponds with surface/volume ratios of 1.90 to 6.26 were flat at high surface/volume ratios of because flatworms are satiated. Rates were low at low surface/volume ratios because prey are unavailable to the predator. Flatworms have definite effects on Daphnia population dynamics in some water bodies, especially in shallow ponds. Evidence also suggests that flatworms are attracted to high densities of Daphnia. THE RESPONSE OF MACROINVERTEBRATES TO AQUATIC MACROPHYTE DECOMPOSITION,

Virginia Commonwealth Univ., Richmond. Dept. of Biology.
L. A. Smock, and D. L. Stoneburner.
Oikos, Vol 35, No 3, p 397-403, November, 1980. 3 Fig, 2 Tab, 38 Ref.

Descriptors: *Littoral zone, *Macrophytes, *Macroinvertebrates, Brown water, *Barrier islands, Limnology, Aquatic life, Decomposition, Aquatic plants, Ponds, Lakes, Leaves, Lake Whitney, *Georgia, Decomposing organic matter.

The data presented describe the relationship between the degree of decomposition of an aquatic macrophyte and the densities of associated macroinvertebrates in Lake Whitney, Georgia. A significant increase in macroinvertebrate density was noted with the onset and progressive senescence of the leaves, as reflected by decreasing chlorophyll a concentrations. The chironomid Polypedilum nymphaeroum Maschwitz and three species of Naididae exhibited positive responses to presumably increasing levels of food as leaf decomposition progressed. P. nymphaeorum larvae probably switched from feeding on periphyton to utlization of decomposing plant tissue and associated microbial decomposers once the Nelumbo leaves began to decompose. Naididae did not become abundant on the leaves until the onset of initial leaf decomposition. Densities of the carnivorous chironomid Ablabesmyia philosphagnos Beck and Beck were more closely related to the age of the leaves than to prey availability, older leaves having been colonized by several generations of individuals while the younger leaves had been colonized by only one generation of individuals. The findings indicate that all stages in the life of macrophytes must be considered before their full importance to macroinvertebrates can be assessed. Both their abundance in a system and their seasonal cycles of growth and decay can be an important regulator of macroinvertebrate densities in the littoral zones of ponds and lakes. (Baker-FRC)

THE FRESHWATER AND BRACKISH-WATER DIATOMS OF PENIKESE ISLAND, MASSACHUSETTS: 1923-1973,

Southeastern Massachusetts Univ., North Dartmouth.
R. K. Edgar.
Rhodora, Vol 82, No 830, p 305-319, April, 1980. 1 Fig, 23 Ref.

Descriptors: *Ponds, *Marshes, *Plankton, *Diatoms, Species composition, *Aquatic populations, Water quality, Lakes, Seasonal variation, Navidula, Gomphonema, Species diversity, Ecology, Succession, Nitzschia, *Penikese Island, *Massachusetts.

The planktonic, epilithic, epipelic and epiphytic diatom assemblages of the ponds and marsh of Penikese Island were examined along with physicochemical parameters and water quality data. In the ponds, 79 diatom species and subspecific taxa were identified. The marsh contained large populations of Gomphonema paravulum, Navicula calida, N. cuspidata, Nitzschia palea, and Pinnularia viridis in 1973. The northernmost reservoir on the hilltop at the southern end of the island contained mostly planktonic populations of Nitzschia kutzingiana and Navicula cuspidata. Notes on eight selected taxa are included as supplemental descriptions of the species identified. Major qualitative differences were found in the diatom flora of Penikese over a 50 year period. No evaluations have been made to determine to what extent these differences are functions of the seasonally variable nature of the ponds and the successional changes in the environment over the past few decades. CHEMISTRY OF A 7.5-M SEDIMENT CORE FROM LAKE VALENCIA, VENEZUELA,

Colorado Univ., Boulder. Dept. of Environmental, Population, and Organismic Biology.
W. M. Lewis, Jr., and F. H. Weibezahn.
Limnology and Oceanography, Vol 26, No 5, p 907-924, September, 1981. 11 Fig, 1 Tab, 55 Ref.

Descriptors: *Sediments, *Geologic history, *Lakes, Salinity, *Chemical composition, Eutrophication, *Lake Valencia, Venezuela, Chemistry of precipitation.

The chemistry of the upper 7.5 m of sediment taken from the middle of Lake Valencia in 37 m of water was studied. This midlake core provides a record of changes in the lake and its watershed over about 13,000 years. The lake began as a dry or seasonal lakebed, accumulating fine clastic materials low in organic matter and essentially devoid of aquatic microfossils. The lake then became permanent, saline, and rather deep. The trend toward freshness and high lake level peaked about 8000 BP, but this moisture peak was brief. There was a return to more saline conditions about 7400 BP, accompanied by high Mg:Ca ratios. The lake is now subject to major artificial eutrophication. Lakes of the lowland tropics have shown radical changes in chemistry, nutrient budgets, and water level over the relatively recent past. The general sequence of events in the lake is similar to sequences documented in the African lowland tropics over the last 13,000 years. (Small-FRC)

COMPARISON OF THE CHEMICAL COMPOSITION OF THE WATERS OF LAKE PIASECZNO (LECZYNSKO-WLODAWSKIE LAKE DISTRICT) AND OF THE SHALLOW GROUND WATERS IN ITS CATCHMENT AREA,

Akademia Rolnicza, Lubin (Poland), Inst. Gleboznawstwa i Chemii Rolnej.
M. Misztal.
Acta Hydrobiologica, Vol 22, No 3, p 239-247, 1980. 3 Fig, 7 Ref.

Descriptors: *Water analysis, *Chemical composition, *Poland, Chemical analysis, *Lakes, *Wells, Potassium, Phosphorus, Sodium, Calcium, Manganese, Seasonal variations, Acidity, Shallow wells.

Water samples were collected from farm wells in the territory of the catchment area of Lake Piaseczno. Lake water samples were also taken. The Lake is small, with part of the catchment territory being covered with forests and others consisting of arable land and a small peat bog. Water level in the wells was highest in the spring of 1975 and subsequently decreased systematically until November. In December and January of the next year a rise in water level was noted, reaching a maximum in April. Lake waters demonstrated rather significant changes in pH, with boundary pH values for waters of the lake taken from the sector adjoining arable land from 6.1 to 8.4 and in the sector bound by forests from 5.8 to 8.6. Variations in the pH of ground waters ranged from 5.8 to 7.8. Phosphorus concentrations also varied considerably, while potassium concentrations remained about the same. Variations in calcium, sodium, and manganese were more similar to the slight changes noted in potassium concentrations. The water from the lake was about 10 times poorer in phosphorus, sodium, calcium, and manganese, and about 5 times poorer in potassium in comparison with the water from the farm wells. The inflow of sodium into the ground water was particularly dependent on the magnitude of rainfall. (Baker-FRC)

SOME HYDROBIOLOGICAL CHARACTERISTICS IN AMVRAKIA LAKE, WESTERN GREECE,

Institute of Oceanographic and Fisheries Researches, Athens (Greece).
T. S. Koussouris, and J. D. Photis.
Acta Hydrobiologica, Vol 22, No 3, p 337-344, 1980. 3 Fig, 1 Tab, 20 Ref.

Descriptors: *Lakes, *Hydrobiology, Tectonics, Thermoclines, *Greece, Aquatic fauna, Plankton, Zooplankton, Phytoplankton, *Amvrakia Lake.

Amvrakia lake is situated in Western Greece and is of tectonic origin, with a northwestern direction. Its water level depends mainly on surface drains, karstic springs, possible underground inlets and invisible discharges. High to mean values of dissolved oxygen were recorded in the lake in the homogenous water column in February, while by June its low values at deep waters were accompanied by hydrogen sulfide. In June fairly stable thermal stratification occurred. The thermocline was between 11 and 13 meters deep. The pH was generally mean to high in the southern basin and high in the northern basin. A vertical variation in pH was noted, probably caused by consumption of carbon dioxide in the epilimnion and release in the hypolimnion. Aquatic macrovegetation was lacking along the shoreline of the lake. The main components of plankton were Cyclotella ocellata (Ehr.) Kutz. and Closterium, Scenedesmus, Prediastrum, Ankistrodesmus species in February, while in June the dominant species comprise some Pennales diatoms and the Chlorophyceae Elakatothrix gelatinosa Wille, Staurastrum leptocladum Wille and Closterium spp. Among the zooplankters the appearance of tintinnopsis lacustris (Entz) Kahl and of Brachionus angularis Gosse, Br. calyciflorus Pall, Polyarthra vulgaris Carl., Filinia longiesta (Ehr.) and Keratella quadrata (Mull.) were characteristic. (Baker-FRC)

LAKE VATTERN,

S. A. Svensson.
Aqua, No 4, p 9-10, 1981.

Descriptors: *Lakes, *Water pollution control, Phosphorus, *Lake Vattern, *Sweden, Nutrients.

Lake Vattern is Sweden's second largest lake and possesses clear, cold water. The biological and chemical studies made of the lake indicate that it contains few nutrients, while it is also a valuable recreational and raw-water source for the area. Vattern contains at least 28 different species of fish, with the principal species being whitefish and char. The question of safeguarding Vattern was raised at the end of the 1950s, when repeated indications regarding changes in the catch of char, increased vegetation, and other changes indicated pollution patterns were occurring. An investigation then showed that in the inflow of organic substances, particularly phosphorus, must decrease if Vattern was not to become a protein-rich lake with accelerated aging. The measures adopted included the requirement that the majority of local authority sewage treatment works be extended to include biological and chemical purification and that effluent treatment and other internal measures be taken within appropriate industries. More natural conditions are now reappearing in the lake. (Baker-FRC)

STANDING CROP DENSITIES AND DISTRIBUTION OF SPIRULINA AND BENTHIC DIATOMS IN EAST AFRICAN ALKALINE SALINE LAKES,

Bristol Univ. (England). Dept. of Zoology.
C. H. Tuite.
Freshwater Biology, Vol 11, No 4, p 345-360, 1981. 7 Fig, 3 Tab, 38 Ref.

Descriptors: *Saline lakes, *Diatoms, Algae, Benthos, Aquatic life, East Africa, *Africa, Spirulina, Lakes, Standing crops.

Information is given about the structure of the primary producer communities in East African alkaline saline lakes and their temporal changes. Measurements were taken of the standing crop densities of phytoplanktonic blue-green algae of the genus spirulina and benthic diatoms. Spirulina abundance was measured as dry mass density, and the validity of the gravimetric estimates was determined by chlorophyll analysis and microscopic counting. Benthic diatom standing crops were assessed by chlorophyll determinations. Spirulina density was extremely variable in time and may appear to fluctuate over more than an order of magnitude. It was not common to see high density blooms of Spirulina as a feature in the lakes. The causes of changes in Spirulina standing crop and the associated alterations in the structure of the primary producer community are discussed. Three qualitative states which may occur are described. Similar standing crops of benthic diatoms were noted in all lakes wherever the water depth was shallow enough to allow light penetration to the sediment surface. (Baker-FRC)

STUDIES ON THE SEASONAL CHANGES OF DISSOLVED ORGANIC CARBON, NITROGEN, PHOSPHORUS AND UREA CONCENTRATIONS IN LAKE BIWA,

Osaka Kyoiku Univ. (Japan). Lab. of Environmental Science.
O. Mitamura, and Y. Saijo.
Archiv fur Hydrobiologie, Vol 91, No 1, p 1-14, March, 1981. 3 Fig, 4 Tab, 35 Ref.

Descriptors: *Seasonal variation, *Dissolved solids, *Lakes, *Japan, Lake Biwa, *Organic carbon, Phosphorus, Nitrogen, Carbon, Urea, Phytoplankton, Algae.

Although there have been many studies of the distribution of dissolved organic matter in the sea, few studies have investigated the concentrations of dissolved nitrogen, carbon, and phosphorus in freshwater. The seasonal variations in dissolved organic carbon (COD), dissolved organic nitrogen (DON), dissolved organic phosphorus (DOP), and urea concentrations in Lake Biwa were investigated in relationship to changes in the thermal stratification of the lake and in the blooming of phytoplankton. Lake Biwa, the largest lake in Japan, has an area of 674.8 square kilometers and a maximum depth of 104 meters. Observations were made at one station in the northern basin (72 meters depth) and one in the southern basin (4 meters depth). The mean DOC values in the upper level layer in the northern basin were consistently higher than those in the lower layer during the thermal stratification period, giving values of 143 and 119 micrograms carbon per liter, respectively. DON, DOP, and urea concentrations showed similar tendencies, giving values of 6.2 and 5.2 micrograms nitrogen per liter, 0.20 and 0.16 micrograms phosphorus per liter, and 0.40 and 0.29 micromoles urea per liter, respectively. The lowest mean values of DON, DOP, and urea in the upper layer were found in November, when the green alga, Staurastrum sp., was blooming profusely. High correlation coefficients were obtained among DOC, DON, and DOP in the lower layer. (Carroll-FRC)

EFFECTS OF SHORT-TERM CHANGES IN RAIN WATER SUPPLY ON THE IONIC COMPOSITION OF ACID MOORLAND POOLS IN THE CAMPINE OF ANTWERP (BELGIUM),

J. H. D. Vangenechten, F. Bosmans, and H. Deckers.
Hydrobiologia, Vol 76, No 1/2, p 149-159, 1981. 6 Fig, 1 Tab, 24 Ref.

Descriptors: *Chemical composition, *Pools, Seasonal variation, Temperature effects, *Belgium, Acidity, Rainfall, *Bogs, Snowmelt, Evaporation, Water level, Rainwater, Water supply.

Physico-chemical characteristics of acid bog lakes were investigated in direct relation to some changes in water supply. During a 3.5 yr survey of 27 bog lakes, very marked changes in water levels were noted as a consequence of climatic conditions. Except for the summer and autumn of 1976, which were very dry and hot, the changes in ionic concentrations from September 1975 through March 1979 were very slight. Most ions exhibited a peak concentration during a few months of 1976. The pH in all pools remained fairly constant. In pools which dried out completely, strongly increased calcium, magnesium and sulfate concentrations were noted during the first months of refilling in autumn. In contrast, pH, potassium and chloride were not changed as compared to values in spring. Only a small increase in sodium was noted. A very high correlation was noted between sulfate and the sum of calcium, magnesium, and sodium, during this time. In pools in which the bottom layer

remained wet during the hot summer, the ionic concentration ratios remained fairly constant. The pH did not change, remaining very acid. It was concluded that during periods of evaporation and subsequent refilling, marked changes in the ionic concentrations and composition can occur. These changes can induce severe stress situations for the aquatic organisms. (Baker-FRC)

ALLOCHTHONOUS PLANT LITTER AS A SOURCE OF ORGANIC MATERIAL IN AN OLIGOTROPHIC LAKE (LLYN FRONGOCH),

University Coll. of Wales, Aberystwyth. Dept. of Zoology.
R. D. G. Hanlon.
Hydrobiologia, Vol 80, No 3, p 257-261, 1981. 2 Fig, 1 Tab, 17 Ref.

Descriptors: *Organic matter, *Oligotrophic lakes, *Litter, Lakes, *Llyn Frongoch, Forest litter, Nutrients, Energy sources, Productivity, *Wales, Carbon cycle.

Planting trees along the shoreline of small oligotrophic lakes with low surface area: shoreline length ratios could provide organic carbon for benthic invertebrates and microorganisms. The contribution of airborne plant litter to Llyn Frongoch, Wales, was estimated to be 100 kg per year (45 kg C per year), equivalent to 5% of the phytoplankton productivity. This lake has an area of 7.2 ha and 23% of the 1450 meters of shoreline is tree-covered. Most of the airborne plant litter was deposited within 10 meters of shore, and the amount of litterfall declined exponentially with distance from the shore. (Cassar-FRC)

THE GAMMARIDAE AND CORIXIDAE OF AN INLAND SALINE LAKE FROM 1975 TO 1978,

Crewe and Alsager Coll., Alsager (England).
A. A. Savage.
Hydrobiologia, Vol 76, No 1/2, p 33-44, 1981. 4 Fig, 5 Tab, 17 Ref.

Descriptors: *Saline lakes, *Benthos, Temperature effects, Seasonal variation, Population dynamics, Vegetation, *Aquatic vegetation, Chemical composition, Salinity, Aquatic organisms.

Changes in the populations of Gammaridae and Corixidae were investigated together with data on sub-aquatic vegetation, chemical conditions and temperature in an inland saline pond, Watch Lane Flash. Comparisons were made with two immediately adjacent pools, Ilse Pool and Red Lane Flash. In 1975, when subaquatic vegetation was virtually absent and summer temperatures and salinities were high, the population consisted almost entirely of Gammarus duebeni and Sigara lateralis. G. tigrinus was first recorded in September. During 1976, when summer temperatures and salinities were again high, G. tigrinus increased rapidly, G. duebeni and fifth instar nymphs of S. lateralis decreased to zero, but adults of the latter species were present. When summer temperatures and salinities were lower during 1977, G. tigrinus increased further; G. duebeni and nymphs and adults of S. lateralis were virtually absent. Subaquatic vegetation redeveloped and nymphs and adults of Sigara concinna were found. The initial success of G. tigrinus coincided with high summer temperatures and salinities. Evidence is presented which suggests that high summer temperatures rather than high salinities especially favor G. tigrinus. It is felt that the exclusion of G. duebeni and S. lateralis was caused by both predation and competition for similar food resources. (Baker-FRC)

ABSORPTION BY CHLORELLA VULGARIS BEIJER. OF PHOSPHORUS COMPOUNDS RELEASED BY THE SUBMERGED MACROPHYTE POTAMOGETON PECTINATUS L.,

Rand Afrikaans Univ., Johannesburg (South Africa). Research Group for Freshwater Biology.
I. S. Van Aswegen, J. H. Swanepoel, and H. J. Schoonbee.
Water SA, Vol 7, No 2, p 76-78, April, 1981. 2 Tab, 9 Ref.

Descriptors: *Phosphorus, *Algal growth, Lakes, Eutrophication, Nutrients, Macrophytes, Algae, Absorption, Accumulation, Chlorella, Phytoplankton, Natural waters, *Phosphorous absorption.

Chlorella vulgaris was used as a test organism to determine the ability of this alga to absorb phosphorus released by both the foliage and the roots of Potamogeton pectinatus. The plants were grown in an aquarium from tubers collected from a lab stream ecosystem. Phosphorus compounds released by both the foliage and roots of the submerged macrophyte were absorbed by Chlorella vulgaris under both light and dark conditions. Chlorella absorbed more phosphorus compounds when incubated in the light than in the dark, which may be related to photosynthetic activity. The P-32 activity of the Chlorella incubation medium derived from the roots of Potamogeton was substantially higher than that derived from the foliage of this hydrophtye. During both light and dark incubation, Chlorella absorbed more or less 40 times more root phosphorus than foliar phosphorus. This may be partly attributed to the higher phosphorus concentration of the incubation medium derived from the root compartment of the culture vessel. It is suggested that in freshwater lakes phosphorus compounds released by the foliage of submerged macrophytes may well be an important source of phosphorus to phytoplankton and epiphytes associated with submerged macrophytes. The ready accessibility of phosphorus released by the roots of aquatic macrophytes for algal absorption may account for the frequent development of dense mats of benthic algae observed on the substrate in water bodies such as Germiston Lake in the Witwatersrand area. (Baker-FRC)
W82-02780

PRODUCTION OF GAMMARUS LACUSTRIS (AMPHIPODA, GAMMARIDAE) IN LAKE SEVAN,

Akademiya Nauk Armyanskoi SSR, Hydrobiological Station.
S. G. Nikolayev.
Hydrobiological Journal, Vol 16, No 4, p 40-44, 1980. 2 Tab, 19 Ref.

Descriptors: *Lakes, *Gammarus, *Amphipods, *Population dynamics, Aquatic life, *Lake Sevan, USSR, Productivity, Water level fluctuations.

The production of Gammarus lacustris in one of the foraging areas of Lake Sevan was determined. The Lake had undergone a reduction in level, which had led to alterations of the thermal regime and appreciably affected hydrobiological processes in the lake. Records of the zoobenthos of one of the main foraging areas of the lake, Noradurskiy Bay, made between April 1975 and November 1976 were used for calculations. Samples were taken in the moss beds at depths between 6 and 12 meters. Eighty such samples were processed. A single sample usually contained the collections of 2 bottom grabs. Changes in the lake have occurred over the years since 1938. As a result of these changes, especially of the more intensive heating of the water in comparison with the period before level reduction and the intensified pressure of predators as a result of the enlargement of the fish stock in the lake, changes were also expected in the production features of the gammarid population. The annual production/biomass (P/B) coefficient recalculated from the 1938 data proved fairly close to the annual P/B coefficient for 15, although it was lower. The data for comparison are the results of year-long observations seperated by an appreciable time interval. They cannot be used to characterize two long periods in the history of the lake in view of annual fluctuations in the production indices of amphipods. It is expected, however, that the mean annual values of the P/B coefficient for the 1938-1939 and 1975-1976 periods would be of similar magnitude. It was concluded that the rate of production of the gammarid population in this area of the lake has apparently remained at the 1938-1939 level. (Baker-FRC)

ON THE SAMPLING SIZE OF ZOOBENTHOS ALONG A LAKE SHORE (IN JANPANESE),

Shibukawa Senior Girls High School, Gunma (Japan).
H. Kurita, and H. Minemura.
Japanese Journal of Limnology, Vol 42, No 1, p 46-51, 1981. 3 Fig, 3 Tab.

Descriptors: *Lakes, *Benthos, Zooplankton, *Lake Haruna, Measuring instruments, Bottom sediments, Sampling, *Japan, Bottom sampling.

A new type of bottom sampler with a circular quadrat was used to analyze the number of replicate samples required to estimate the species number, density and biomass of zoobenthos along a shallow shore of Lake Haruna, Gunma Prefecture, in August of 1978. A very large number of replicate samples were required to estimate the total number of taxa and individuals, and the total biomass, in the shallow part of the stony zone, where the samples presented a poor fauna and a large variation. In the deeper stony and aquatic plant zone, with an abundant fauna and a smaller variation of samples, about six replicate samples were required to estimate the number and the biomass at the permissible 30% error level and the 95% level of confidence of the mean. A large number of samples are required to identify species showing a low density and an aggregated distribution. (Baker-FRC)

THREE COASTAL LAKES ON KAMIKOSHIKI ISLAND, KAGOSHIMA PREFECTURE,

Nagasaki Univ. (Japan). Faculty of Fisheries.
M. Matsuyama.
Japanese Journal of Limnology, Vol 42, No 1, p 52-57, 1981. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Lakes, *Stratification, Bottom sediments, Chlorine, Coastal waters, *Japan, *Lake Kaiike, Saline water intrusion, Limnology.

An outline of Lake Kaiike and two adjacent lakes, Namakoike and Kazakiike, is offered, and the stratified condition of Lake Kaiike is considered in relation to these other two lakes. All these lakes are cut off from the sea by a long gravel bar about 3.5 km long, 50 meters wide, and 2-5 meters high. At present, the leeward half of the gravel bar which faces the lake is overgrown with scrub about 4 meters high except in areas of erosion. The lakes receive little inflow of fresh water except for rainwater runoff, and they have no surface outlet across the bar. Intrusion of seawater into Lake Kaiike is slight compared with Lake Namakoike. The littoral zone is dominated by submerged plants, and the sublittoral area is vegetated by plants such as Cyperaceae and Gramineae. On the southeast side of the lake, a swamp called Suguchiike is present. In Lake Namakoike both temperature and dissolved oxygen decreased with depth, but chlorinity exhibited only a slight increase with depth. Hydrogen sulfide was restricted to the bottom water, and a significant exchange of water with the sea through the gravel bar was important in preventing the lake from becoming stratified like Lake Kaiike. Chlorinity was low in Lake Kazakiike and there is no indication of stratification. It is important to clarify whether a stratified stage occurs only in Lake Kaiike or is ubiquitous in basins produced by deposition of a gravel bar across the indentations of sea coast. (Baker-FRC)

FUNCTIONAL RELATIONSHIPS BETWEEN NUTRIENT DYNAMICS, OXIDATION-REDUCTION CAPACITY, AND EUTROPHICATION IN A SOFT-WATER LAKE,

Connecticut Univ., Storrs. Dept. of Biological Sciences.
R. W. Kortmann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168550, Price codes: A08 in paper copy, A01 in microfiche. PhD Dissertation, June, 1981. 140 p, 17 Fig, 17 Tab, 69 Ref. OWRT-A-071-CONN(6), 14-31-0007-6007.

Descriptors: Nutrient behavior, Dissolved nitrogen, Phosphorus budgets, Benthic fluxes, *Lakes, *Limnology, *Nutrients, Phosphorus, Benthos, Hypolimnion, Epilimnion, Inflow, Oxidation-reduction potential, *Eutrophication.

The net nutrient behavior (Net System Flux) of a softwater lake was determined on a weekly schedule using steady-state compartment modeling. The watershed hydrology (upon which budget accuracy depends) was defined using storm event sampling, unit-hydrograph simulation, groundwater simulation and in situ seepometers. Highly significant correlation was found between flowrates predicted by unit hydrograph simulation and observed flow-rates. Phosphorus concentration and hydrograph flowstage exhibited a significant relationship (prepeak postpeak baseflow). Chemical and hydrological data were combined using 'flow-interval' and 'typical concentration' techniques, resulting in dissolved nitrogen and phosphorus budgets of high resolution. Hypolimnetic-epilimnetic and benthic fluxes of nutrients and reduced chemical compounds (products of anaerobic respiration) were determined by in situ incubation and application of eddy diffusion coefficient estimates. Transport of ferrous iron, methane (dissolved gas) and total sulfide across the sediment-water interface was about 50, 700, and 10, x10exp-7 moles per square centimeter per year, respectively. Transport of ferrous iron, total phosphorus, ammonia, carbon dioxide, oxygen and silica across the 2.5 meter plane was about +0.0237, +0.016, +0.432, +0.0015, -3.71, and +0.368 micromoles per square meter per day, respectively, while the hypolimnion was anoxic. Benthic flux of total phosphorus, determined by in situ incubation was about 30.6 (+ or - 15%) milligrams per square meter per day, which compared well with literature values. Nutrient cycling between sediments and epilimnetic water represents a significant budget contribution.

HYDROLOGIC DESCRIPTION OF LAKE HANCOCK, POLK COUNTY, FLORIDA,

Geological Survey, Tallahassee, FL. Water Resources Div.
K. M. Hammett, L. J. Snell, and B. F. Joyner.
Geological Survey Open-File Report 81-131 (WRI), 1981. 1 Sheet, 13 Fig, 2 Tab, 21 Ref.

Descriptors: *Lakes, *Limnology, *Lake morphometry, Hydrologic budget, Lake stages, Eutrophication, Surface-groundwater relations, Water quality, Chemical analysis, Water analysis, Data collections, *Florida, Polk County, *Lake Hancock.

Available data were evaluated to document hydrologic conditions in the Lake Hancock basin. Bathymetric data indicate that Lake Hancock is very shallow, having a maximum depth of about 3 feet. The lake bottom is covered by a layer of organic material that may be more than 5 feet thick near the center of the lake. Lake Hancock's stage fluctuates within 0.5 foot of average stage about 40 percent of the time. Lake outflow is through an operable control. There are many days with no outflow in some years. A water-budget analysis of the lake indicates that substantial lake stage declines in 1968 and 1975 followed successive years of deficient precipitation and were primarily the result of a net loss of water from the lake to the ground-water system. During a period in 1971-72 when lake stage remained relatively stable, the ground-water system contributed a significant volume of water to the lake. Water-quality data indicate that Lake Hancock is in a eutrophic state. The eutrophication process appears to have been accelerated through the addition of nutrients from inflow of wastewater effluent from secondary treatment plants. (USGS)

SOME ECOLOGICAL ASPECTS OF LAKE QARUN, FAYOUM, EGYPT. PART I. PHYSICO-CHEMICAL ENVIRONMENT,

Institute of Oceanography and Fisheries, Cairo (Egypt). Inland Waters and Fish Culture Div.
M. M. Ishak, and S. A. Abdel-Malek.
Hydrobiologia, Vol 74, No 2, p 173-178, September, 1980. 4 Fig, 4 Tab, 21 Ref.

Descriptors: *Salinity, *Nutrients, *Water quality, Lakes, *Lake Qarun, *Egypt, Saline lakes, Drainage canals, Fertilizers, Nitrogen compounds, Nitrates, Nitrites, Phosphates, Water pollution sources, Physicochemical properties.

Physicochemical changes in Lake Qarun, Egypt, are described. The 235 sq km lake is 40 km long and 9.25 km at the widest point. Mean depth is 4.2 meters and the lake level is 44 meters below sea level. The lake receives 390 million cu meters of water annually from two drainage canals. An equal amount evaporates, leaving 430,000 tons of salts from two drainage canals. An equal amount evaporates, leaving 430,000 tons of salts each year and thus increasing salinity with time. Construction of the Aswan Dam in 1965 has decreased suspended matter in Nile water, necessitating use of artificial fertilizers, which also increases salinity. Salinity has increased from 10.65-11.26 o/oo in 1906 to 30.6 o/oo in 1955 and 30.9-34.5 o/oo in 1974-76. Present values are 26-29 o/oo in winter and 33-34 o/oo in summer. Other water quality parameters are: transparency, 60 cm near the drainage canal to 200-300 cm in the western part; nitrates, 36.83-55.92 mg-atom per liter nitrate-N; nitrates, 0-0.125 mg-atom per liter nitrate-N; and phosphates, 0-0.7 mg-atom per liter phosphate-P. Descriptors: *Antarctic, *Lakes, *Benthic flora, Aquatic plants, Productivity, Algae, Polar regions, Phytoplankton, Ice cover, Iced lakes, Seasonal, Aquatic productivity, Limnology, Oxygen, Respiration, Mosses, Signy Island, Light intensity.

Three oligotrophic lakes on Signy Island, Antarctica, were studied May 1976 to March 1977 to characterize their productivity. Phytoplankton was sparse; benthic plants predominated. This community had adapted to the low light intensity under the ice cover, so that growth stops only during early winter (June to early August) when plants are below the compensation point. Irradiance at the bottom of the lakes ranged from 1 in midwinter to 2600 kJ per sq meter per day in early summer. Production rates were no higher during the open water period, and no photo-inhibition was observed. Annual production (carbon in g per sq meter) for three benthic communities was: Tolypothrix-Plectonema (Sombre Lake), 9; Phormidium dominated algal felt (Changing Lake), 3.3; and aquatic mosses Calliergon and Drepanocladus (Moss Lake), 4. Maximum productivity rates of the above three communities (measured as oxygen evolution rate per unit ash-free dry weight, micrograms per mg per day) were 10.8, 4.2, and 7.7, respectively. More eutrophic lakes on the same island have a seasonal phytoplankton growth as well as the benthic and mixed vegetation. (Cassar-FRC)

THE PRODUCTION ECOLOGY OF BENTHIC PLANTS IN SOME ANTARCTIC LAKES. II. LABORATORY PHYSIOLOGY STUDIES,

Natural Environment Research Council, Cambridge (England). British Antarctic Survey.
J. Priddle.
Journal of Ecology, Vol 68, No 1, p 155-166, March, 1980. 5 Fig, 1 Tab, 23 Ref.

Descriptors: *Iced lakes, *Photosynthesis, *Algae, *Mosses, *Water temperature, *Antarctic, Polar regions, Lakes, Aquatic plants, Respiration, Light penetration, Light intensity, Irradiation, Plant physiology, Oxygen uptake, Oxygen, Temperature effects.

The photosynthetic physiology of two algal communities and two aquatic mosses from the Antarctic lakes of Signy Island were studied in laboratory tests. Blue-green algae Tolypothrix and Plectonema displayed a light compensation point of 0.17 W/sq m. These algae had a maximum net rate of oxygen production per unit ash-free weight of about 0.6 micrograms/milligram/hour, with a high and variable rate of respiratory oxygen uptake. A predominantly Phormidium community with a compensation point of 0.09 W/sq m had a lower maximum net rate of oxygen production and respiration rate. The mosses Calliergon sarmentosum and Drepanocladus sp. had similar respiration rates (about 0.3 micrograms/milligram hour per unit ash-free dry weight) at normal lake temperatures. Between 1.2 and 30 degrees, respiration rate increased linearly with temperature at different rates for the two mosses. Drepanocladus displayed a compensation point similar to the algal communities studied, while Calliergon had a higher compensation point. When temperature was increased in the experimental range of irradiance, the compensation point also shifted to a higher irradiance, especially in the Calliergon mosses. (Geiger-FRC)

CYCLOPS SCUTIFER SARS - ONE AND TWO-YEAR LIFE CYCLES WITH DIAPAUSE IN THE MEROMICTIC LAKE BLANKVATN,

Oslo Univ. (Norway). Inst. of Zoology.
K. Elgmork, and A. Langeland.
Archiv fur Hydrobiologie, Vol 88, No 2, p 178-201, March, 1980. 15 Fig, 45 Ref.

Descriptors: *Cyclops, *Meromictic lakes, *Life cycles, Lakes, *Copepods, Aquatic animals, Crustaceans, Mixolimnion, Chemocline, Plankton, Lake sediments, Seasonal distribution, Monimolimnion, Limnology, Hydrobiology, Aquatic populations, *Lake Blankvatn, *Norway.

A detailed life history study of a freshwater copepod population of Cyclops scutifer Sars was undertaken at the 55 m deep, meromictic lake Blankvatn just north of Oslo, Norway. The copepod life cycle consists of both a one- and a two-year developmental sequence with diapause in the sediment lasting from September to April. Members in the plankton and in diapause in the sediment are restricted to the mixolimnion, with greatest numbers close to the sediment are restricted to the mixolimnion, with greatest numbers close to the surface and to the chemocline for the planktonic phase and near the chemocline for the diapause phase. C. scutifer exhibits three main reproductive periods, one in spring, one in late summer, and one in winter. Part of the diapause population was also found in sediments of the monimolimnion. A long residence near the chemocline was noted for copepods preparing for diapause. No vertical migration was observed. (Geiger-FRC)

POST-GLACIAL SEDIMENTS IN LAKE LINNEVATN, SPITSBERGEN,

Oslo Univ. (Norway). Inst. of Limnology.
A. Boyum, and J. Kjensmo.
Archiv fur Hydrobiologie, Vol 88, No 2, p 232-249, March, 1980. 9 Fig, 2 Tab, 15 Ref.

Descriptors: *Lake sediments, *Sedimentology, *Paleolimnology, Core logging, Glacial sediments, Bottom sedimentation, Sedimentation basins, Limnology, Radioactive dating, Carbon radioisotopes, Carbon, Carbonates, Leaching, *Lake Linnevatn, *Norway.

A sediment core of 560 cm from Lake Linnevatn, Spitsbergen, Norway was studied in efforts to reveal the post-glacial history of the lake basin which once was part of the Isfjorden. Chemical studies on sediment clearly showed the seawater and freshwater periods of the basin. The entire post-glacial history of the lake was characterized by highly inorganic sediments. In sediments of the seawater period, total carbon content was high, and carbonate fractions caused severe errors when radiocarbon dating was used. Examinations of the transition sediments, a sandy layer at 300 cm marking the change from seawater to freshwater, resulted in calculations of 3,300 years as the freshwater period of Lake Linnevatn. Leaching in a freshwater environment caused increases in sediment aluminum levels. Additional changes in the composition of sediments at 300 cm in the core were attributed to a shift in the parent rocks from which the sediments were derived. (Geiger-FRC)

PERIPHYTON IN THE VOLTA LAKE. I. SEASONAL CHANGES ON THE TRUNKS OF FLOODED TREES,

Volta Lake Research and Development Project, Akosombo (Ghana).
E. K. Obeng-Asamoa, D. M. John, and H. N. Appler.
Hydrobiologia, Vol 76, No 3, p 191-200, 1980. 7 Fig, 1 Tab, 16 Ref.

Descriptors: *Periphyton, *Population dynamics, *Seasonal variation, *Volta Lake, *Ghana, Lakes, Nutrients, Algae, Cyanophyta, Chlorophyta, Diatoms, Species diversity, Water level, Nitrates, Ammonia.

The seasonal changes in periphyton growing on four flooded trees in the Volta Lake, Ghana, were studied for a year starting in October 1974. The quantitatively most important species of the 47 found were Navidula, Synedra, and Melosira (diatoms); Spirogyra, Oedogonium, and Stigeoclonium (green algae); and Oscillatoria and Anabaena (blue-green algae). The species diversity and cell numbers of diatoms and green algae were high in October and November, corresponding to a period of lake stabilization after the flood period. Species diversity and cell numbers rapidly declined with the drop in lake level over the dry season to a low in June-July. The blue-green algae and diatoms peaked in March-May, the early part of the wet season, when water was warmest (29.7 C) and pH was highest, 7.2. At this time the green algae were at a minimum. Nitrate was high during October-November (0.5 mg per liter) and during March-April (0.8 mg per liter), while ammonia was high in December-January (0.2 mg per liter). At the period of minimum lake level (July) some green filamentous algae began significant increases in cell number until September and declined with a rise in lake level. (Cassar-FRC)

PERIPHYTON IN THE VOLTA LAKE. II. SEASONAL CHANGES ON WOODEN BLOCKS WITH DEPTH,

British Museum of Natural History London (England). Dept. of Botany.
D. M. John, E. K. Obeng-Asamoa, and H. N. Appler.
Hydrobiologia, Vol 76, No 3, p 207-215, 1980. 4 Fig, 1 Tab, 13 Ref.

Descriptors: *Periphyton, *Population dynamics, *Seasonal variation, *Volta Lake, *Ghana, Algae, Cyanophyta, Chlorophyta, Diatoms, Species diversity, Water depth, Nitrates.

Periphyton were allowed to colonize and grow for one year on wooden blocks suspended at 0, 0.5, 1, 2, and 5 m in the Volta Lake, Ghana. Forty-seven species were recorded (26 diatoms, 9 green algae, and 10 blue-green algae). Diatoms were most numerous in the first 3 months (October to December, 1974) and again in the last month of the study. Green and blue-green algae, nearly absent for the first 3 months, increased in number as the year progressed. Green algae were the most numerous group after a year's growth. All numbers decreased with depth, especially below 2 m. species diversity of the 3 types of algae generally followed the cell number seasonal and depth patterns. Blue-green algae and diatom numbers increased in April-May with the higher levels of nitrate during the early rains. (Cassar-FRC)

OBSERVATIONS ON SOME COMMON PARASITES OF BAGRUS DOCMAC FORSKAHL (PISCES: SILUROIDEA) OF LAKE VICTORIA,

East African Freshwater Fisheries Research Organization, Jinja (Uganda).
G. B. Mbahinzireki.
Hydrobiologia, Vol 75, No 3, p 273-280, November, 1980. 5 Fig, 30 Ref.

Descriptors: *Lake fisheries, *Fish parasites, *Parasites, *Lake Victoria, Bagrus docmac, Fihseries, Leeches, Nematodes, Crustaceans, Invertebrates, Fish farming, Catfish.

Specimens (1340) of Bagrus docmac Forskahl, an important commercial catfish in Lake Victoria, were examined for 3 common parasites: external crustaceans and leeches and internal nematode larvae. Almost every fish in the susceptible size group (16.0 cm) was infected with 1 or more types of parasites. Argulids were recovered from 36% of the samples. However, 88% carried 6 or less argulid parasites per fish. There was a positive correlation between fish size and argulid incidence; maximum was 37 on a 110.3 cm fish. Leeches occurred on only 4% of fish, but those infected had as many as 50. Leeches were especially common on fish living in water less than 10 m deep. Eustrongylides sp. and Contracaecum sp. were the most common nematodes, infecting 57% of the fish. Smaller fish (< 16.0 cm) had none or few of these parasites. Fish probably acquire the nematode larvae by ingesting prey. Possible pathological effects are: inflammation and sores on the skin and gills, poisoning from toxins, damage to internal organs, and impairment of digestion. Infected fish in the lake were in good condition (K = 3.12), but the overcrowded conditions common in fish farms could cause serious mortality. (Cassar-FRC)

ZOOPLANKTON OF LAKE TAUPO,

Department of Scientific and Industrial Research, Taupo (New Zealand). Ecology Div.
D. J. Forsyth, and I. D. McCallum.
New Zealand Journal of Marine and Freshwater Research, Vol 14, No 1, p 65-69, 1980. 6 Fig, 16 Ref.

Descriptors: *Zooplankton, *Lakes, *Lake Taupo, *New Zealand, Rotifers, Aquatic animals, Seasonal variation, Trophic level.

Seasonal changes in species composition and abundance of zooplankton were measured in Lake taupo at three sites each month from August 1974 to January 1976. The zooplankton were dominated by adult and immature stages of Boeckella propinqua Sars at 38.0%, the cladocerans Ceriodaphnia dubia Richard at 8.4% and Bosmina meridionalis Sars at 3.6%, and the cyclopoid copepod Macrocyclops albidus (Jurine) at 1.0%. These crustaceans made up 50.3% of the zooplankton, with the remaining 49.7% being rotifers. The most common rotifers were Polyarthra vulgaris (carlin) at 36.0% of the total zooplankton numbers, Conochilus coenobasis (Skorilow) at 10.3%, Asplachna brightwelli Gosse at 2.2%, and Hexarthra sp at 1.1%. Zooplankton populations were generally low in winter, increasing in spring and declining in autumn, in other parts of New Zealand. In Lake Taupo, however, numbers tended to be highest in autumn, mainly due to the greater number of rotifers caught with the small mesh size net used in this study. (Baker-FRC)

OCCURRENCE, DISTRIBUTION AND SEASONAL PERIODICITY OF SOME AQUATIC FUNGI OF SAT-TAL (NAINITAL), INDIA,

Kuman Univ., Naini Tal (India). Dept. of Botany.
G. S. Mer, S. C. Sati, and R. D. Khulbe.
Hydrobiologia, Vol 76, No 3, p 201-205, 1980. 2 Tab, 22 Ref.

Descriptors: *Fungi, *Seasonal variations, Aquatic fungi, Soil fungi, Distribution patterns, Microorganisms, *India, *Lakes.

Aquatic fungi (Blastocladiales, Saprolegnailes, Lagenidiales, and Peronosporales) were studied in 3 lakes and their surrounding soils in the Sat-Tal area of India. The 23 species were grouped into three categories according to occurrence (aquatic, amphibious, and terricolous) and three categories with respect to temperature range (low temperature, below 18C; moderate temperature, 18.1-26.8C; and constant species, 8-26.8C). The aquatic molds varied seasonally according to temperature. In water the highest number of species was observed in the rainy season and the minimum in other seasons, according to site. In soils, the aquatic fungi were most numerous in spring, summer, or the rainy season and least numerous in winter. (Cassar-FRC)

FACTORS INFLUENCING THE COMPOSITION, STRUCTURE AND DENSITY OF A POPULATION OF BENTHIC INVERTEBRATES,

Alberta Environmental Center, Vegreville.
J. W. Moore.
Archiv fur Hydrobiologie, Vol 88, No 2, p 202-218, March, 1980. 5 Fig, 2 Tab, 46 Ref.

Descriptors: *Eutrophication, *Lakes, *Seasonal variation, *Species composition, *Benthic fauna, *Ecological effects, Algal growth, Aquatic animals, Aquatic populations, Midges, Oligochaetes, Molluscs, Subarctic zone, Water quality, Population density, Species diversity, Food chains, Littoral zone, Bays.

The composition, structure, and seasonal abundance of benthic invertebrate populations were studied in a eutrophic bay on the north shore of Great Slave Lake in the Canadian subarctic between May 1977 and May 1978. Shoreline communities consisted of 55 species, with predominant representations of chironomids, molluscs, and oligochaetes. During winter months, chironomids were most abundant, with maximum densities of 1500 larvae/sq m, while molluscs and oligochaetes nearly equaled each other in number throughout the year. Gut content analyses showed that there were few algae-eating microfaunal species in the summer. Offshore communities contained 46 species, of which chironomids and molluscs were predominant. Most offshore chironomids emerged 2 weeks later than their nearshore counterparts. Offshore herbivores subsisted mainly on detritus. It was concluded that the density of oligochaetes was correlated with algal abundance, and that the quantities of food ingested had little effect on benthic populations. Water quality had noticeable effects on species composition, while water temperature and sediment organic content affected emergence times of some species. (Geiger-FRC)

SCREEN MESH SIZE AFFECTS ESTIMATES OF MACRO- AND MEIO-BENTHOS ABUNDANCE AND BIOMASS IN THE GREAT LAKES,

National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
T. F. Nalepa, and A. Robertson.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, No 9, p 1027-1034, September, 1981. 2 Fig, 7 Tab, 25 Ref.

Descriptors: *Benthos, *Lakes, *Great Lakes, *Biomass, Aquatic life, Measuring instruments, Sampling.

A study was performed to determine the relation of mesh size to sampling efficiency for Great Lakes benthic animals. The efficiencies of screens with meshes of two different sizes, 595 micrometers and 106 micrometers, in retaining the macro- and meiobenthos from Lake Michigan sediment samples have been determined. Samples were taken at nine stations in southeastern Lake Michigan near the mouth of the Grand River. The 595-micrometer screen was much less efficient in retaining chironomids and oligochaetes other than mature Limnodrilus. This coarse screen retained only about half of all chironomids. Obviously, the mesh size used to quantify the macrobenthos should vary with the purpose of the study. Retention of certain macrobenthic taxa was significantly related to sampling date and water depth, indicating that future studies concerned with those variables should use mesh sizes small enough to retain all of the individuals from the taxa of interest. BLUE-GREEN ALGAL AMMONIA UPTAKE IN HYPERTROPHIC PRAIRIE LAKES,

National Water Research Inst., Burlington (Ontario). Aquatic Ecology Div.
T. P. Murphy, and B. G. Brownlee.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, No 9, p 1040-1044, September, 1981. 3 Fig, 1 Tab, 19 Ref.

Descriptors: *Lakes, *Trophic level, *Ammonia, Nitrogen, Nutrients, Algal growth, Absorption, Prairies, *Manitoba, Canada, Kinetics.

It is proposed that N-uptake experiments can determine the degree of algal N demand and thus confirm that N limitation in the hypertrophic prairie lakes occurs only for short periods. The lakes chosen for this kinetic study are located in the Erickson-Elphinstone area of southwestern Manitoba, Canada. They have virtually unialgal compositions. The Aphanizomenon samples were at least 98% pure, and the Microcystis samples were at least 90% pure. Two types of ammonia uptake were noted in this study. Active uptake kinetics, a hyperbolic response to increased ammonia ion concentration, was encountered in water samples with low ambient ammonia. Saturation kinetics, a linear response to increased ammonium ion levels, was measured in samples collected with high ambient concentrations of ammonia. When the in situ ammonia-uptake velocity per unit particulate nitrogen of each Michaelis-Menten experiment was plotted as a function of the lake ambient ammonia concentration, the algal ammonia uptake was shown to adapt to the new nutrient levels. The adaptation shown by Aphanizomenon and Microcystis to changing ammonia ion cncentrations has important ecological consequences. The ability to take up large quantities of ammonia when or where it is concentrated and either grow quickly or use it later in ammonia-deficient water would give these algae a great competitive advantage. This could explain why blue-green algae dominate lakes with large but ephemeral supplies of ammonia but are unimportant in lakes with little ammonia. (Baker-FRC)

AMMONIA VOLATILIZATION IN A HYPERTROPHIC PRAIRIE LAKE,

National Water Research Inst., Burlington (Ontario). Aquatic Ecology Div.
T. P. Murphy, and B. G. Brownlee.
Canadian Journal of Fisheries and Aquatic Sciences, Vol 38, No 9, p 1035-1039, September, 1981. 3 Fig, 1 Tab, 16 Ref.

Descriptors: *Trophic level, *Ammonia, Absorption, *Lakes, Volatility, Nitrogen cycle, Prairies, *Manitoba, Canada, Eutrophication, Kinetics, Storms, Water quality management, *Fishkill, Algal growth.

This paper proposes that some processes of the ammonia cycle can be mediated by weather, and that this is an important factor in the development or decline of phytoplantkton biomass. Lake 885 in the Erickson-Elphinstone area of southwest Manitoba, Canada was used, as it has a history of many algal bloom collapses. The lake has an area of 2.4 ha and a maximum depth of 2.9 meters. Ammonia uptake was measured with Michaelis-Menten kinetic analysis. The first storm event sampled was in a phosphorus-enriched limnocorral. The storm resulted in high ammonia concentrations only in the P limnocorral. There was a large increase in the number of airinetes and many of the Aphanizomenon flakes had separated into individual filaments. During two periods of high pH and high ammonia concentrations, ammonia disappearance rates of 20-30 micrograms N/liter/hour were noted. At these times rates of ammonia uptake by phytoplankton were 2.6-4.3 microgram N/liter/hour as measured by a N-15 method. The high excess rates of ammonia disappearance are best explained by volatilization of ammonia from the lake surface. The loss of ammonia induced nitrogen fixation; however, much larger quantities of ammonia were lost via ammonia volatilization after the algal bloom collapsed than the algae could fix in one season. PHYSICOCHEMICAL INFLUENCES ON PHYTOPLANKTON PRODUCTION IN A TROPICAL ALPINE LAKE,

Hawaii Univ., Honolulu. Dept. of Botany.
J. E. Massey.
Archiv fur Hydrobiologie, Vol 91, No 2, p 133-143, May, 1981. 2 Fig, 5 Tab, 23 Ref.

Descriptors: *Phytoplankton, *Alpine regions, *Lakes, Tropic zone, Population dynamics, Nitrogen, Light intensity, Cycling nutrients, Nutrients, Eutrophication, *Hawaii.

The roles of the physical and chemical environments in primary production were explored, using a small tropical alpine lake as the study site. The lake was monitored during May through September of 1977 and is located at 3969 meters on the summit plateau of an extinct Hawaiian volcano. Lake Waiau is moderately productive by alpine standards. The shoreline was heart shaped with a maximum diameter of 73 meters and a total surface area of 0.60 ha. Maximum depth was 2 meters. Acidity ranged from 8.4 to 9.8. Water temperatures varied from 4.5 to 13.0 degrees C. Thermal stratification was not noted. Primary phytoplankton production ranged from 59.3 to 350.0 mgC/square meter/day. The maximum volumetric rate of carbon assimilation was 38.0 mg C/cubic meter/hour. Algal population composition was determined by chlorophyll concentrations and silicon depletion rates. The flora consisted of a few species of planktonic algae and an epilithic mat composed of Cyanophyta and some Chlorophytes. The photosynthetic capacity of the system did not vary significantly over the five month study period. Three regression models were developed to assess specific physical or nutritional influences and their interactive effects on production. Light levels, rate of nutrient cycling, and nitrogen concentrations appear to limit, whereas nickel may act to inhibit, phytoplankton production. (Baker-FRC).

THE SCHOOLING MECHANISM OF YOUNG PERCH (PERCA FLUVIATILIS) IN THE OPEN PART OF LAKE-TYPE RESERVOIRS (AS EXEMPLIFIED BY RYBINSK RESERVOIR),

Akademiya Nauk SSSR, Borok. Inst. Biologii Vnutrennykh Vod.
V. K. Konobeyeva, A. G. Konobeyev, and A. G. Poddubnyy.
Journal of Ichthyology, Vol 20, No 2, p 49-62, 1980. 7 Fig, 3 Tab, 29 Ref.

Descriptors: *Fish behavior, *Intakes, *Reservoirs, Rybinsk, *USSR, *Perch, Lakes, Wind-driven currents.

A method of predicting the distribution of young fish was developed and tested on data from the Rybinsk Reservoir, USSR. The distribution of larvae is determined by wind currents and the bottom contour. The fish young, which move passively with water masses, are widely and evenly distributed during June and July. At the end of summer, fingerlings are passively carried into the sedimentation zones, where they remain with the maximum biomass of benthic invertebrates and plankton. The main areas where young fish aggregate may be predicted knowing the spawning places, time of mass hatching of the young, the velocity and direction of the wind currents, and the bottom contour at the time of aggregation. This information is helpful in placing water intakes to minimize fish mortality. Intakes must not be set up in zones of ooze accumulation, in the sheltered coastal zone with vegetation, in river mouths, or near main routes along which young fish are moved by the currents. (Cassar-FRC)

2I. Water In Plants

WINTER WATER RELATIONS OF RED SPRUCE ON MOUNT MONADNOCK, NEW HAMPSHIRE,

Harvard Univ., Cambridge.
D. T. Kincaid, and E. E. Lyons.
Ecology, Vol 62, No 5, p 1155-1162, October, 1981. 3 Fig, 1 Tab, 36 Ref.

Descriptors: *Water potentials, *Spruce trees, *Altitude, Seasonal variation, Temperature effects, *Mount Monadnock, *New Hampshire.

This study was designed to test the hypothesis of Baldwin (1977) that severe water deficits occur for red spruce and to determine whether stem water potential decreases with altitude and decreases cumulatively during winter. Also, the level (shoot, tree, altitude, season) where the greatest variability occurs in water status was determined, and the temperatures of tree tissues and microenvironments were measured at different altitudes. In addition, an electron scanning microscope was used to xamine old, dead, or exposed needles to determine cuticular damage. Water potential averaged -1.14 MPa for 545 shoots over two winters, indicating that severe dehydration did not occur. No clear trends were found between altitude and water potential, and the coldest collection days did not correspond to the lowest water potentials. A study of water potential variations of modular parts of single trees may be more useful. (Small-FRC)

MINERAL NUTRIENT AVAILABILITY IN WATERCRESS BED SUBSTRATES,

Bath Univ. (England). School of Biological Sciences.
I. P. Cumbus, L. W. Robinson, and R. G. Clare.
Aquatic Botany, Vol 9, No 4, p 343-349, December, 1980. 1 Fig, 3 Tab, 10 Ref.

Descriptors: *Aquaculture, *Nutrients, *Watercress, *Substrates, Phosphates, Manganese, Nitrates, Calcium, Potassium, Magnesium, Iron, Zinc, Minerals.

Three commercial watercress beds were selected as experimental sites for a preliminary survey of mineral nutrient availability. Substrate water samples contained low levels of nitrate-nitrogen in comparison with surface waters at each site. This supports the finding that watercress crops are almost entirely dependent on surface irrigating water for their nitrate supply and therefore the water throughput must be maintained at a high level. Total nitrogen in shoot and root tissues from all three sites were above the tissue critical levels. Phosphorus concentrations in substrate waters were at least a factor of 10 greater than those in surface waters. Potassium levels were similar in both surface and substrate waters. Levels of calcium and magnesium at each site were higher in the substrate than in surface waters. Root systems of watercress penetrate the bed substrates and may use mineral nutrients within this environment. (Baker-FRC)

VERTICAL VARIATION IN STEMFLOW GENERATION,

Simon Fraser Univ., Burnaby (British Columbia). Dept. of Geography.
I. Hutchinson, and M. C. Roberts.
Journal of Applied Ecology, Vol 18, No 2, p 521-527, August, 1981. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Interception, *Stemflow, *Canopy, Trees, *Fir trees, Conifers, Simulated rainfall, Rainfall, Precipitation, Throughfall.

Stemflow resulting from simulated rainfall was measured at four heights (about 0, 1, 2, and 4 m from the base) on a 15-year old open grown Douglas fir tree, 9 m high. The branch interception area increased exponentially with the branch length, yielding a total interception area of 37.4 sq m. Total stemflow was less than 2% of the total precipitation (0.61 cm per hour for 1 hour, 0.77 cm per hour for 2 hours, and 0.41 cm per hour for 4 hours). Although the branches on the lower 2 m of trunk would be expected to produce 31% of the stemflow according to interception capacity, they were actually responsibile for only 1.7%. The branches attached between 2 and 4 meters on the trunk and the branches attached between 4 meters and the top contributed 58.2% and 40.1% of total stemflow, respectively. This pattern is caused by differences in the stem-branch angles, which are 70-80 degrees near the top and 80-90 degrees near the bottom. Lower branches are horizontal or drooping and thus contribute more to throughfall than to stemflow. (Cassar-FRC)

2J. Erosion and Sedimentation

MODELING RILL DENSITY,

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
R-M. Li, V. M. Ponce, and D. B. Simons.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No IR1, p 63-67, March, 1980. 1 Fig, 4 Ref.

Descriptors: *Rills, *Turbulent flow, *Laminar flow, Model studies, Rainfall-runoff relationships, Channel flow, Erosion, Sediment yield, *Agricultural engineering, Erosion control.

The development of a rill density model would permit a quantitative estimate to be made of the factors influencing soil erosion and sediment yield, with important potential applications. Rill development is a complex physical process involving the interaction of hydrologic, geomorphic, and geotechnical components of the agricultural landscape. A mathematical formulation of rill density was developed, based on stream morphology concepts. The equations derived give the rilling density in laminar and turbulent flow as a function of the slope of the plane measured along a specific distance, threshold rainfall intensity, armoring diameter, and several constants for friction, transport and morphology. These equations agree with statements in the literature that rilling density increases with increasing threshold runoff rate and decreasing particle diameter. (Cassar-FRC)

EROSION RESISTANCE OF COHESIVE SOILS,

Rhode Island Univ., Kingston. Dept. of Civil Engineering.
W. E. Kelly, and R. C. Gularte.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY10, p 1211-1224, October, 1981. 8 Fig, 3 Tab, 31 Ref.

Descriptors: *Erosion, *Soil stability, *Cohesive soils, Creep strength, Shear stress, Mathematical studies.

The applicability of both the rate process and double layer theories to the erosion of cohesive soils was investigated. The results demonstrated the applicability and utility of the rate process theory for qualitatively describing surface erosion of cohesive soils. Interparticle bonds in both erosion and creep were found to be similar. Flow volumes depended primarily on salinity. Resistance to erosion was measured by the critical shear stress and exhibited the same dependency on the number of interparticle bonds per unit area as soil strength did. This interpretation may explain in part why attempts to relate erosion resistance to undrained shear strength have had only limited success. (Small-FRC)

RECENT INSHORE SEDIMENTS IN MUSANDAM, OMAN,

University Coll., London (England).
C. Vita-Finzi, and S. J. Phethean.
Marine Geology, Vol 36, No 3/4, p 241-251, July, 1980. 5 Fig, 2 Tab, 23 Ref.

Descriptors: *Organic carbon, *Sediments, Chemical composition, *Musandam Peninsula, North Oman, Carbon, Coasts, Sediment transport, Sediment distribution, Ephemeral streams.

The organic carbon content was investigated in sediments recovered from an expedition to North Oman on which grab samples were taken of some of the inlets and bays of the Musandam Peninsula. This peninsula forms the northern tip of Oman, in eastern Arabia, and is separated from Iran by the narrow Strait of Hormuz. It consists of a series of plateaus and headlands, separated by bays and fjord-like gulfs. The coast is bounded by steep cliffs which in places exceed 200 m in height. The bulk of the peninsula is underlain by the massive, gently-dipping limestones and dolomitic limestones of the Musandam Series, ranging in age from Triassic to Lower Cretaceous. The deepest parts of the Persian Gulf lie close to the Iranian shore, with depths of over 100 m occurring in the Strait of Hormuz. The samples were dominated by clay- and silt-sized particles with subordinate fine to coarse sand. Much of the silt consisted of comminuted skeletal material. The sand was partly skeletal in origin and contained foraminifers, ostracods, serpulid tubes and bivalve fragments. The organic carbon content ranged from 0.15 to 3.34% and is related to median grain size. Although in general texture it is related to water depth, the content of organic carbon is also influenced by distance from the open sea. The effect of terrigenous sedimentation is confined to the mouth of the area's major watercourse, the ephemeral Wadi al'Ayn, and to inshore areas supplied by the products of bioerosion. It is suggested that differential preservation, rather than supply, of organic carbon accounts for the observed distribution pattern. (Baker-FRC)

PALEOLIMNOLOGY OF LAKE KIZAKI,

Kyoto Univ. (Japan). Inst. of Paleolimnology and Paleoenvironment on Lake Biwa.
S. Horie, K. Yaskawa, A. Yamamoto, T. Yokoyama, and M. Hyodo.
Archiv fur Hydrobiologie, Vol 89, No 4, p 407-415, August, 1980. 6 Fig, 9 Ref.

Descriptors: *Sedimentology, *Paleolimnology, Sediment deposition, Volcanoes, *Lake Kizaki, *Japan, *Lake sediments, Glacial lakes.

Sediment cores of Lake Kizaki, Japan, revealed that this mesotrophic lake was once a closed body of water having a low deposition rate. At the 28 meter depth (at least 20,000 years old) a gravel bed, probably of glacial origin, was located. In the lower half of the core, 12 layers of volcanic ash were found by geomagnetic industry and bulk density measurements. Nine of the ash layers were 0.1-0.5 cm thick; the others ranged from 2 to 23 cm thick. (Cassar-FRC)

SOIL EROSION AND TOTAL DENUDATION DUE TO FLASH FLOODS IN THE EGYPTIAN EASTERN DESERT,

Cairo Univ., Giza (Egypt). Dept. of Natural Resources.
T. M. Labib.
Journal of Arid Environments, Vol 4, No 3, p 191-202, September, 1981. 6 Fig, 4 Tab, 31 Ref.

Descriptors: *Floods, *Soil erosion, *Denudation, Erosion, Sediment load, Sediment discharge, *Nile River, Egypt, Solute transport, *Flash floods, Deserts, Arid lands, Runoff, Suspended sediments, Deltas.

A sudden rain that fell on the whole eastern desert of Egypt on February 19 and 20, 1975, caused the Nile River to rise 2 meters and the suspended matter to increase to 3040 ppm (Feb. 23). Total precipitation input was estimated at 539,361 million cu meters. Flash flood water input to the river during the 20 day flood period was estimated at 454,200 million cu meters; total suspended load during the flood period, 1,850,811 tons; and total discharge of sediment carried to the Nile by the flash flood water 2,790,189 tons. Average solutes during the flood were 595 ppm, vs. 320 ppm nonflood. Dissolved solutes attributed to flash flood waters were 692,787 tons. The total sediment discharge for the 98,506 sq km area (3/4 of sediments reaching the Nile, 1/4 deposited in wadi) was 37.8 tons per sq km, higher than the average for the African continent (27 tons per sq km). Chemical denudation in the eastern desert was 9.4 tons per sq km; total denudation 42,858 cu meters per sq km per storm or 4 cm per 1000 years. The volume of the Nile cone was estimated, considering flash flood contributions over the last 25 million years, at a total of 191,760 cu km, with flash floods accounting for 16,000 cu km of this. The soil

erodibility factor was calculated at 0.05 tons per ha per storm. Only 8% of the precipitation reached the groundwater reservoir. Water conservation, diversion, and storage, as well as soil conservation including planting trees and crops and controlled grazing, are urgently recommended for the eastern desert region. (Cassar-FRC)

FLOW RESISTANCE IN COARSE GRAVEL BED RIVERS,

Ministry of Works and Development, Christchurch (New Zealand).
G. A. Griffiths.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY7, p 899-918, July, 1981. 2 Fig, 5 Tab, 41 Ref.

Descriptors: Flow, Rivers, *Channel flow, *River flow, *Friction loss, Hydraulics, Fluid mechanics, Critical flow, Gravel, Sand, River beds, *Sediment transport, *Bed load, Experimental design, Roughness, *Flow resistance.

Results of the study of two sediment transport regimes are presented. In one regime, the channel boundary is rigid, and in the other, the boundary is deformable. The study included a dimensional analysis of the two regimes, calibrated by linear multiple regression. It also included the collection of 136 field data sets from 72 reaches on 46 New Zealand gravel bed rivers. Results indicate that resistance to turbulent flow is primarily dependent on roughness under the rigid channel regime, and that resistance is primarily dependent on a mobility parameter under the deformable boundary regime. MAPPING SEDIMENT SOURCES IN A NEW ZEALAND MOUNTAIN WATERSHED,

Forest Research Inst., Christchurch (New Zealand).
M. P. Mosley.
Environmental Geology, Vol 3, No 2, p 85-95, 1980. 6 Fig, 2 Tab, 18 Ref.

Descriptors: *Sediment control, *Mapping, *Surveys, Watershed management, Sediment loads, *Sedimentology, Sediment distribution, Mountain lakes, New Zealand.

A survey technique was developed to provide an inventory of sediment sources, where sediment sources are classified in terms of geomorphic type and degree of activity or severity. The procedure, originally developed by the New Zealand Ministry of Works, was refined, tested for validity and reproducibility, and evaluated for research and management purposes. The Harper-Avoca River, Canterbury, was studied, as this is a major water supply source for the Lake Coleridge power scheme and has had problems with sediment load. Over 700 individual sediment sources were identified and mapped in the watershed, requiring 15 days in the field. The techniques provided useful information on the locations of major sources of sediment and on the relative importance of each feature. Thus, sites whose treatment or control would bring the most benefit in reducing sediment loads were identified. (Small-FRC)

EROSION CONTROL ALONG TRANSPORTATION ROUTES IN NORTHERN CLIMATES,

Komex Consultants, Ltd., Calgary (Alberta).
F. B. Claridge, and A. M. Mirza.
Arctic, Vol 34, No 2, p 147-157, June, 1981. 12 Fig, 1 Tab, 3 Ref.

Descriptors: *Erosion, *Engineering, Permafrost, Erosion control, Erosion rates, Revegetation, Frozen ground, North America, Cold regions.

Erosion problems encountered in the planning of roads and pipelines for the transmission of natural gas and oil along routes in Northern climates in North America are considered. Erosion involves the physical and chemical weathering of rock and the transport and deposition of unconsolidated materials by water and wind action, gravity and thermal processes. The rate of erosion is affected by soil type, climate, vegetation, and drainage basin characteristics. Various construction activities contribute directly to erosion. Hydraulic erosion is caused by rainfall and flowing water. The loosening and transport of soil particles results from surface runoff occurring as channelized flow or sheet flow. Susceptibility of an exposed site to hydraulic erosion depends primarily on the soil properties, slope and corresponding flow velocities. Silts and fine sands low in cohesion are most susceptible to erosion. Gravels are much less susceptible because of the large sizes of particles. Although clays are finer in grain size, they are often less susceptible to erosion than are silts and sands, owing to their structure and cohesion. Most instances of severe erosion occur when drainage is uncontrolled through an area of ground disturbance. Where the ground cover has been disturbed or removed, subsidence and entrapment of water may follow, leading to ponding which can accelerate the degradation of permafrost. If water begins to flow, hydraulic erosion may follow and result in the formation of erosion gullies. Erosion control efforts are discussed, including granular blankets, channel liners, ditch checks, rock aprons and energy dissipators, and siltation basins. (Baker-FRC)

BED LOAD DISCHARGE COEFFICIENT,

National Water Research Inst., Burlington (Ontario). Hydraulic Research Div.
P. Engel, and Y. L. Lau.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1445-1454, November, 1981. 4 Fig, 2 Tab, 12 Ref.

Descriptors: *Bed load, *Discharge coefficient, Flow discharge, Sediment load, *Sediment transport, Sedimentation, Bottom sediments, Dunes, Dimensional analysis, Flow separation, Flow velocity, Flow pattern, Flow measurement, Sand, Multiphase flow.

The bed-load discharge coefficient for the case of two-dimensional flow over dunes is expressed in terms of bed-form geometry and the sand size of the bed material using dimensional analysis. Experiments were conducted in a rectangular flume using artificial dunes and a flow visualization method to measure the flow separation length, from which the bed-load coefficients were determined. The results of the study indicated that the position of zero transport on the back of a dune varies with the steepness of the dunes and the grain size of the bed material. The bed load coefficient is quite sensitive to changes in dune steepness and, to a lesser degree, to changes in grain size of the bed material. When dunes are flat, the effect of grain size on the bed load coefficient is significant. When dunes are steep, the coefficient depends on dune steepness only. The use of the bed load coefficient resulted in some improvement by decreasing the overall average error in a set of 10 separate flume tests. The value of the bed load coefficient K = 1.32 as used by Engel and Lau appears to be a special case representing the value for maximum dune steepness of 0.006. The application of the bed-load coefficient results in some improvement in estimating bed load. (Baker-FRC)

FLUORESCENCE SPECTRA OF WATER-SOLUBLE HUMIC MATERIALS AND SOME POTENTIAL PRECURSORS,

Academy of Natural Sciences of Philadelphia, Avondale, PA. Stroud Water Research Center.
R. A. Larson, and A. L. Rockwell.
Archiv fur Hydrobiologie, Vol 89, No 4, p 416-425, August, 1980. 2 Fig, 3 Tab, 24 Ref.

Descriptors: *Streams, *Fluorescence, *Humic acids, *White Clay Creek, *Pennsylvania, Springs, Microbial degradation, Degradation, Organic matter, Chemical reactions, Lignin, Coumarin, Dissolved organic matter.

Fluorescence characteristics of water samples from White Clay Creek, Pennsylvania, and its tributaries differed among the 6 sites studied. Water from the spring at the source showed fluorescence spectra similar to those of substituted cinnamic acids and partly degraded lignins. Further downstream in the third-order stream reach, samples had spectra characteristic of coumarins. Photooxidation of caffeic acid (3,4-dihydroxy cinnamic acid), concentration 0.18-18 ppm, produced a 36% yield of esculetin (6,7-dihydroxy coumarin) within 1.5 hours. A combination of biotic processes, such as lignin degradation, and abiotic processes, such as sediment adsorption, may contribute to the changes in dissolved organic matter fluorescence in the downstream direction. Lignin biodegradation forms catechols, which may undergo radical coupling, ring cleavage, quinone formation, and other chemical reactions to produce cis-cinnamic derivatives, which lactonize to coumarins. DISSOLVED IODINE FLUX FROM ESTUARINE SEDIMENTS AND IMPLICATIONS FOR THE ENRICHMENT OF IODINE AT THE SEDIMENT WATER INTERFACE,

Chicago Univ., IL. Dept. of Geophysical Sciences.
W. J. Ullman, and R. C. Aller.
Geochimica et Cosmochimica Acta, Vol 44, No 8, p 1177-1184, 1980. 5 Fig, 1 Tab, 50 Ref.

Descriptors: *Iodine, *Sediment-water interfaces, Interfaces, Halogens, Fluctuations, *Estuaries, Chemical reactions, Sediments.

Some of the diagenetic redistribution processes are examined which influence the distribution of iodine in surficial earth environments, with emphasis on the sediment-water interface. Rates of exchange of dissolved iodine between sediment and overlying water are determined, and the transport-reaction regime that these rates must reflect is elucidated. Sediment and water samples used in the study were obtained from a station in Mud Bay, South Carolina. Mud Bay is a shallow, muddy embayment on the north side of the larger and deeper Winyah Bay of 10 to 12 meters in maximum depth. Surface water salinity is highly variable, but a mean chlorinity of about 0.25M is evident from pore water profiles taken from 1 meter length cores. The yearly temperature range is about 6-30 degrees C. The results show that the flux, pore water and production rate data are consistent with the release of iodine into solution during the anaerobic decomposition of organic matter. The exponential decrease of the production rate with depth in sediment is similar to that found for the release rates of other mineralized organic constituents such as nitrogen and with the general distribution of microbial metabolic activity in sediments. Flux estimates ranged between about 5 and 41 micromoles per square meter per day. These estimates, predicted from either the pore water iodine concentration gradient across the sediment-water interface or the dissolved iodine production rate, were higher than the apparent flux measured directly at the same site. This suggests that iodine which is released to the pore water under the anoxic conditions below the sediment surface reacts with a sedimentary component at or near the sediment-water interface and is lost from solution. MULTIVARIATE ANALYSIS AND GEOCHEMICAL INTERPRETATION OF SPATIAL VARIABILITY OF THE WATER QUALITY OF SOUTHERN QUEBEC RIVERS, (ANALYSE MULTIVARIEE ET INTERPRETATION GEO-

CHIMIQUE DE LA VARIABILITE SPATIALE DE LA QUALITE DE L'EAU DES RIVIERES DU QUEBEC MERIDIONAL),

Quebec Univ., Sainte-Foy.
B. Bobee, M. Lachance, and L. Potvin.
Journal of Hydrology, Vol 53, No 1/2, p 95-116, September, 1981. 5 Fig, 2 Tab, 12 Ref.

Descriptors: *Statistical analysis, *Geochemistry, *Rivers, Water analysis, Variability, *Chemical analysis, *Quebec, Water pollution sources, Chemical composition, Solutes, Water quality.

Correspondence analysis was used to analyse the spatial variability of a group of parameters measured at 62 sampling sites along southern Quebec (Canada) rivers. The parameters were conductivity and content of calcium, magnesium, sodium, potassium, sulphate, chloride, and silica. A clustering method was applied to the results of correspondence analysis, which led to the definition of four homogeneous zones. Three of the zones corresponded to the Laurentian Plateau, the Appalachian Mountains, and the St. Lawrence Lowlands. The fourth overlaps the appalachian Mountains and the St. Lawrence Lowlands. The behavior of each zone was related to the topography and geological characteristics of its geographical location. (Small-FRC)

DETERMINATION OF THE SOLUBILITY OF FERROUS SULFIDE IN A SEASONALLY ANOXIC MARINE BASIN,

Freshwater Biological Association, Windermere (England).
W. Davison, and S. I. Heaney.
Limnology and Oceanography, Vol 25, No 1, p 153-156, January, 1980. 1 Fig, 1 Tab, 18 Ref.

Descriptors: *Marine environment, *Sulfides, Basins, Limnology, *Iron, Seasonal variation, Temperature effects, Ferrous sulfide.

Measurements were made of iron (II) and sulfide levels for a seasonally anoxic marine basin. Water samples were taken at a moored site over the deepest part of the basin in September of 1978. Dissolved oxygen, temperature and turbidity were measured on site. Sulfide was measured polarographically and spectrophotometrically. Total iron was measured by acid digestion and spectrophotometric measurement of the iron chloride complex, and alkalinity was determined by Gran titration. The pH of the residue was measured with an electrode system. The field observations suggested that ferrous sulfide saturation would most probably be achieved in waters deeper than 19 meters. Sampled water initially looked clear, but on standing for 1 to 2 hr, developed a fine black precipitate. This change in appearance could be due either to the fine colloidal ferrous sulfide originally present becoming visible as its particle size increased or to fresh precipitation of ferrous sulfide. The latter would result from either a genuine solubility change on exposure to atmospheric temperature and pressure or shock-induced precipitation of a slightly supersaturated water. It was concluded that in dynamic seasonally mixed systems, irrespective of the ionic strength, the effective solubility of ferrous sulfide is similar to the measured value for freshly formed amorphous ferrous sulfide. ANALYSES OF SOLUTE DISTRIBUTIONS IN DEEPLY WEATHERED SOILS,

Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
A. J. Peck, C. D. Johnston, and D. R. Williamson.
Agricultural Water Management, Vol 4, No 1/3, p 83-102, 1981. 8 Fig, 1 Tab, 25 Ref.

Descriptors: *Solute transport, *Salinity, *Water quality, Water resources development, Soil properties, Erosion, Chlorine, Salts, Farming, Chemical analysis, Saline soils, *Australia.

The storage and distribution of solutes in lateritic soils and deeply weathered materials which blanket the Archean shield of granitic and gneissic rocks in Western Australia are discussed. Methods for the analysis of solute distributions in soil profiles are considered and applied to the examination of data from boreholes representative of those in the area. At borehole sites 1551 and 8251 there is evidence to support chloride ion flux densities at depths between 11 and 17 meters which are less by factors 6 and 12 respectively than the local average rates of chloride ion deposition in rainfall. In these regions it is concluded that there are spatially uniform water flux densities. This flux density is negligible at site 8251, so that diffusion is the dominant chloride ion transport mechanism in this part of the profile. At site 1551 the water flux density between 10 and 18 meters is estimated to be -0.5 mm per year. The small upward flux of water at this site reflects net discharge from the permanent groundwater which is consistent with the site location in a gentle saddle. (Baker-FRC)

IRON AND MANGANESE IN LAKE VECHTEN (THE NETHERLANDS): DYNAMICS AND ROLE IN THE CYCLE OF REDUCING POWER,

Institute of Limnology, Nieuwersluis (Netherlands).
H. Verdouw, and E. M. J. Dekkers.
Archiv fur Hydrobiologie, Vol 89, No 4, p 509-532, August, 1980. 12 Fig, 8 Tab, 22 Ref.

Descriptors: *Iron, *Manganese, *Chemical reactions, Heavy metals, Metals, Sediments, Lake sediments, *Lake Vechten, *Netherlands, Lakes, Hypolimnion, Deposition, Sediment transport, Chemical precipitation, Solubility, Chaoborus, Stratification.

Concentrations of iron and manganese were measured in the hypolimnion and sediments of Lake Vechten, The Netherlands, maximum depth 10.5 m, during March-November 1973, 1974, and 1975. Fe levels in the hypolimnion ranged from zero at the beginning and end of the sampling season to 20-22 mg per liter in September at the 10 m depth. Mn levels in the hypolimnion ranged from a low of 0.5 mg per liter to 4.5-7.5 mg per liter in September at the 10 m depth, and from 0-6.5 mg per liter at 9 m. The water was supersaturated with respect to FeCO3 from the bottom to 9 m and for MnCO3 up to 8 m. Total Fe concentrations in the sediments were 7.2-14.1 mg per g wt weight; Mn concentrations, 0.19-0.41 mg per g wet weight. Lowest levels of total metals were found in the surface sediments, 0-3 cm, and highest levels in the deepest, 9-12 cm. About 4-6% of Fe and 10-20% Mn were in exchangeable form, and 0.3-0.5% Fe and 1.2-2.0% Mn were dissolved in the interstitial water. Of the total Fe and Mn found in the 0.12 cm sediment layer, only 1% Fe and 25% mN were released to the hypolimnion. It was concluded that at least 12 cm of the upper sediment must be involved in interaction with the overlying water. A probable mechanism is perturbation by Chaoborus flavicans larvae. The reducing power represented by the Fe/Mn system was about 0.5% of primary production, and sulfate reduction, about 1%. (Cassar-FRC)

METEOROLOGICAL INTERPRETATION OF THE CHEMICAL COMPOSITION OF RAIN-WATER AT ONE MEASURING SITE,

Utrecht Rijksuniversiteit (Netherlands). Inst. voor Meteorologie en Oceanografie.
W. A. H. Asman, J. Slanina, and J. H. Baard.
Water, Air, and Soil Pollution, Vol 16, No 2, p 159-175, August, 1981. 5 Fig, 6 Tab, 19 Ref.

Descriptors: *Rainfall, *Mathematical studies, Wind, Coasts, Meteorological data collection, Coastal waters, Rain, Nitrogen compounds, Hydrogen ion concentration, Air masses, Rainfall rate, *Water pollution sources, *Netherlands, Rain water, Chemical composition.

During 42 periods of 2 or 3 days each at one coastal site of the Netherlands, rainwater levels of H, NH4, Ca, Mg, K, Na, SO4, NO3, Cl, F, Pb, Fe, Br, Mn, V and Al were determined. No clear correlations were found between the coefficients of variation in the amounts of rainfall and the wind speed. When the air mass originates from the land (continental period), rainwater shows a larger concentration of terrestrial components. When the air mass comes from the sea (maritime period), the concentration of marine components is greater. Other meteorological factors had only minor effects on the chemical composition of rainwater. Nitrate and nitrite compounds were responsible for generating about 36% of the H-ions in rainwater. The most important neutralizing agent was NH3. When there was no neutralization by NH3 during continental periods, levels of H were about 2.55 times greater. A chemical definition of the continentality of rain is given and applied to rain samples collected during a meteorological event. (Geiger-FRC)

A SEDIMENT TRAP EXPERIMENT IN FUNKA BAY, JAPAN: 'UPWARD FLUX' OF PARTICULATE MATTER IN SEAWATER,

Hokkaido Univ., Hakodate (Japan). Dept. of Chemistry.
S. Tsunogai, M. Uematsu, N. tanaka, K. Harada, and E. Tanque.
Marine Chemistry, Vol 9, No 4, p 321-334, August, 1980. 5 Fig, 5 Tab, 22 Ref.

Descriptors: *Marine sediments, *Suspended sediments, *Bottom sediments, Bays, Fluctuations, Sampling, Sedimentology, *Funka Bay, Japan.

Settling matter was collected from Funka Bay, Japan, and the results were compared with other particles found in sea water, such as suspended particles and plankton. Analysis of this data lead to the development of an hypothesis for the transport of suspended substances in the marine environment. The existence of an upward flux of particulate matter is proposed, where the ascending paticles are not resuspended old bottom sediments. When the material obtained in the traps was analyzed for metals, organic elements, and radionuclides together with the suspended material in the water column, tow groups with different downward fluxes were determined. One group had a small flux that increased with depth, while the other had a rather constant large flux which was observed only in winter. The specific activity of 243Th did not decrease in winter, indicating that the large winter flux was not caused by resuspension of bottom sediments. Thus, the downward flux is not a net removal rate, and there must be an upward particulate flux in the bay. (Small-FRC)

KINETICS AND PRODUCT OF FERROUS IRON OXYGENATION IN AQUEOUS SYSTEMS,

California Inst. of Tech., Pasadena. W. M. Keck Lab. of Environmental Engineering Science.
W. Sung, and J. J. Morgan.
Envirnomental Science and Technology, Vol 14, No 5, p 561-568, May, 1980. 9 Fig, 5 Tab, 28 Ref.

Descriptors: *Iron compounds, *Oxidation, *Kinetics, Chemical reactions, Oxygenation, Saline water, Seawater, Lepidocrocite.

The effects of ionic media, alkalinity, and temperature on the kinetics of ferrous iron oxygenation and the chemical nature of oxidation products were studied. This knowledge is of interest to the fields of water supply and treatment, wastewater, limnology, and oceanography. Solutions of NaClO4,

NaCl, and Na2SO4, each buffered with bicarbonate-CO2, were used. For solutions of pH less than 7, the general rate law was found to be consistent with earlier work: -d times concentration of ferrous ion/dt = k times concentration of hydroxyl ions squared times P02 times concentration of ferrous ion, where k is the rate constant and PO2 is the oxygen pressure in atmospheres. Increases in ionic strength increase oxidation times, and increases in temperature decrease oxidation times. At pH 6.5-7.2 oxygenation half times are in the sequence SO4 > Cl > ClO4 for constant ionic strength. This explains the observation that ferrous ion oxidation in seawater is usually 100 times slower than in fresh water compositions. For pH greater than 7, kinetic data show catalysis of aqueous ferrous ion disappearance by the reaction product, which was identified by infrared spectra and X-ray diffraction as gamma-FeOOH, or lepidocrocite. These findings help explain the reported differences in ferrous ion behavior in fresh, estuarine, and marine waters. (Cassar-FRC)

AN ANALYSIS OF THE FIRST YEAR OF MAP3S RAIN CHEMISTRY MEASUREMENTS,

Washington Univ., Seattle. Dept. of Civil Engineering.
M. B. Baker, D. Caniparoli, and H. Harrison.
Atmospheric Environment, Vol 15, No 1, p 43-55, 1981. 11 Fig, 1 Tab, 13 Ref.

Descriptors: *Rain, *Chemical analysis, Model studies, Sulfates, Nitrates, *Water pollution sources, *Acid rain, Acidity, Sampling, Meteorological data collection, Data collection.

General considerations are presented of the sampling problems inherent in rain chemistry measurements, along with an analysis of preliminary data from four stations of the Multistate Atmospheric Power Production Pollution Study (MAP3S). A primitive theoretical model of the scavenging of certain kinds of pollutants, notably sulfates, is reviewed, in which the variable nature of the removal precesses is explicitly considered and from which are derived certain measurement priorities. A description of the MAP3S data from the first year of operation is offered, along with an analysis of the available data and conclusions and recommendations for improved network design. The analysis of rain chemistry measurements from the MAP3S program has given numerical values for parameters of theroetical models of wet deposition of sulfur in general agreement with values estimated earlier for Western Europe. Thus, the probability of rain is about equal to 0.12, the characteristic rainout rate is about 0.3/hr, and the residence time for atmospheric sulfur species is about 100 hr. Both sulfate and nitrate affect the pH readings at all stations. Factor analyses and meteorological analysis of selected high deposition events revealed inadequacies in the present reporting and collecting procedures. Without adequate meteorological data and ambient vertical concentration profiles, the rain chemistry data will be of only limited value. (Baker-FRC)

NONTIDAL CIRCULATION AND MIXING PROCESSES IN THE LOWER POTOMAC ESTUARY,

State Univ. of New York at Stony Brook. Marine Sciences Research Center.
A. D. Hamilton, and R. E. Wilson.
Estuaries, Vol 3, No 1, p 11-19, March, 1980. 10 Fig, 4 Tab, 10 Ref.

Descriptors: *Estuaries, *Nontidal currents, *Mixing, Destratification, Currents, Salinity, Potomac River estuary, Rivers, Eddies, Water currents.

Current meter and hydrographic data collected over a 60 kilometer reach of the lower Potomac River Estuary from Dahlgren to Lewisetta, Virginia were analyzed. Attempts were made to relate variations in estimates for vertical eddy viscosity and eddy diffusivity to variations in Richardson number and to relate variations in the shear effect to variations in Richardson number. Over the length of this reach there is both a marked increase in stratification and a substantial decrease in tidal current amplitude toward the seaward end. The analysis suggests that values for vertical eddy viscosity and eddy diffusivity scale with water depth, tidal current amplitude and bulk Richarson number according to conventional empirical formulas. However, the constant which relates the vertical eddy coefficients under conditions of neutral stability to the product of water depth and tidal current amplitude is found to be an order of magnitude less than that expected for tidal conditions. Analyses also suggest that the degree of enhancement of longitudinal dispersion by the shear effect associated with the nontidal currents is a strong function of bulk Richardson number. (Baker-FRC)

ON MODELING THE TURBULENT TRANSPORT OF PASSIVE BIOLOGICAL VARIABLES IN AQUATIC ECOSYSTEMS,

Dalhousie Univ., Halifax (Nova Scotia). Dept. of Oceanography.
J. S. Wroblewski, and J. J. O'Brien.
Ecological Modelling, Vol 12, No 1, p 29-44, March, 1981. 10 Fig, 38 Ref.

Descriptors: *Turbulent flow, *Hydrologic models, *Cycling nutrients, *Eddy diffusion, *Upwelling, *Ocean circulation, Phytoplankton, Ecosystems, Mixing, Limiting nutrients, Euphotic zone, Advection, Aquatic drift, Velocity, Vertical flow, Model studies.

Turbulence in aquatic ecosystems is recognized as an important factor for nutrient and phytoplankton mixing to enhance primary production in the lighted zone. The present work demonstrates that plankton models which incorporate time-dependent, mixed layer dynamics in their velocity fields give rise to an implicit turbulent flux of passive scalars, making complex formulations of the eddy diffusivity unnecessary. An Oregon upwelling ecosystem model is used to calculate the complex eddy diffusivity which would be needed to replace incorporations of realistic advection. The use of this substitution is not recommended. Ways in which an apparent negative eddy diffusivity may arise in advective plankton models and create gradients in biological fields are illustrated. ACOUSTIC REFLECTION FROM ESTUARINE PYCNOCLINES,

Western Australian Inst. of Tech., South Bentley. Dept. of Physics.
J. D. Penrose, and T. Beer.
Estuarine, Coastal and Shelf Science, Vol 12, No 3, p 237-249, March, 1981. 3 Fig, 1 Tab, 24 Ref.

Descriptors: *Estuarine environment, *Acoustics, Stratification, Estuaries, Pycnocline, *Plankton, Zooplankton, Salinity, Temperature effects, Remote sensing, Sounding, Population density, Sound waves, Moore River, Australia.

The nature of acoustic back scattering from pycnoclines and appropriate scattering centers was investigated in order to comment on the performance of echo sounding as a sensing tool for mid-water layered plankton populations in an estuarine environment. The Moor River was used as a test site, as it is one of a number of Western Australian river-estuary systems which form well defined pycnoclines during at least part of the year. Several trips were made to the site, where acoustic reflection from a mid-water layer was noted on an echo sounder, measurements were made of temperature and salinity in the water column, and an assessment of plankton density was formed. The site yielded a relatively sharp, well defined pycnocline with a backscatter signal equivalent in magnitude to that expected from a single -86 dB target in the beam center, at the level of the pycnocline. Such a target strength could arise, at 200 kHz, from large zooplankton and at higher frequencies, from smaller organisms. The acoustic reflectivity from an estuarine pycnocline which is diffusion-controlled could be expected to drop with frequency because of the graded interface mechanism discussed. These findings suggest that by the use of very high sounder frequencies, the contribution of zooplanktonic scatters to the return echo can be made to exceed that due to the impedance contrast provided by temperature salinity variation with depth. In many estuarine situations, some degree of turbulence of various origins may be compatible with a recognizable pycnocline structure. The effect of such turbulence on acoustic echo formation needs further study. (Baker-FRC)

SOME FIELD MEASUREMENTS CONCERNED WITH THE BEHAVIOR OF RESISTANCE COEFFICIENTS IN A TIDAL CHANNEL,

Birmingham Univ. (England). Dept. of Civil Engineering.
D. W. Knight.
Estuarine, Coastal and Shelf Science, Vol 12, No 3, p 303-322, March, 1981. 20 Fig, 20 Ref.

Descriptors: *Estuaries, *Shear stress, Resistance, Tidal effects, Tidal rivers, Coastal waters, Mathematical models.

Analytical, field and laboratory studies were undertaken of the nature of resistance in unsteady open channel flow. The studies were carried out on a 1.2 km reach of the Conwy Estuary, North Wales, and were measurements made of the local resistance and dispersion parameters under varying tidal and fluvial conditions. Along the entire length of the estuary additional measurements of water level, velocity, salinity and water quality parameters were also taken for the purpose of modeling the entire system. The variations in the five terms of the unsteady flow equation throughout a tidal cycle were illustrated and an assessment made of their relative importance. The water surface slope term was the dominant one except for an hour either side of high slack water. The Manning and Darcy-Weisbach resistance coefficients for the 1.2 km test reach varied significantly with stage, particularly towards low water. At high values of stage, Manning's n was approximately constant around 0.028. The longitudinal density gradient term was important in that without it a marked hysteresis effect was noted on certain tides. The Nikuradse roughness height varied with stage, increasing from 0.2 meters at high water to a value comparable to the depth at low water. Computed values of shear velocity and boundary shear stress were within generally accepted values. It is advised that selecting a single roughness parameter to represent conditions in an individual element of a one-dimensional model is not wise. A stage-dependent resistance coefficient would represent a wide range of tidal conditions. (Baker-FRC)

Open-File Report 81-213, February, 1981. 150 p, 1 Fig, 5 Tab, 8 Ref, Append.

Descriptors: *Estuaries, *Phytoplankton, *Chlorophyll, Biomass, Population dynamics, Data collections, Sampling, Sites, *San Francisco Bay, California, Water quality, Salinity, Turbidity, Water temperature.

This report summarizes the distribution of phytoplankton biomass and selected hydrographic properties measured in the San Francisco Bay Estuary, on a near-monthly basis, from July 1977 through December 1979. Parameters measured were: chlorophyll a, phaeopigments, in-vivo fluorescence, turbidity, size distribution of phytoplankton, salinity and temperature. (USGS)

R. L. J. Wong, and J. E. Cloern.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225. Price: $13.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 81-214, February, 1981. 103 p, 1 Fig, 3 Tab, 20 Ref, 5 Append.

Descriptors: *Estuaries, *Phytoplankton, *Taxonomy, Biomass, Population dynamics, Data collections, Sampling, Sites, *San Francisco Bay, California, Nutrients, *Ecological effects, Fish, Invertebrates, Hydrogen ion concentration, Dissolved oxygen, Water quality.

Data are presented on the phytoplankton species composition and abundance in San Francisco Bay from July 1977 through December 1979. Phytoplankton identification and enumerations were made at selected stations. Sample collections were made at selected stations in the main channel of the Bay from Rio Vista on the Sacramento River to Calaveras Point in South San Francisco Bay, and at shoal stations in the central portion of South San Francisco Bay, San Pablo Bay, and Suisun Bay. Also reported, from October 1978 through December 1979, are the calculated phytoplankton carbon and percent nondiatom carbon, and the species list. This study is one component of an ongoing interdisciplinary study of San Francisco Bay. (USGS)

DEVELOPMENT OF THE RIVER SEINE ESTUARY: CASE STUDY,

Societe Grenobloise d'Etude et d'Applications Hydrauliques (France).
F. Parthiot.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1283-1301, November, 1981. 5 Fig, 10 Ref.

Descriptors: *Model studies, *Estuaries, Estuarine environment, Rivers, *Seine River, France, Tides, Water currents, Waves, Field studies, Mathematical models, Case studies.

The study of an estuary is described on a movable bed scale model; the study began in 1950 and still continues. In spite of the schematic way in which this movable bed model represents the actual phenomena of nature, it is a true measuring apparatus, which is altogether accurate, sensitive and representative. The designing, building, calibrating and operation of the model are described to provide valuable information for designing of the channel training works completed in 1963. After the first success, a new version of the model was built in 1967 with certain changes in detail; this continues to serve for studies of development works in the estuary up to the present time. Hydraulic and sedimentological characteristics of the estuary are described, as well as the model design criteria which led to the choice of scales and bed material. Other modeled features include waves, tides, and offshore current. The calibration tests included the successful reproduction of the natural evolution of the estuary, observed over a period of almost 100 years. The conclusion demonstrated how optimum efficiency can be achieved by using a mathematical model of estuary tides and currents in combination with a movable bed scale model. (Baker-FRC)

SEASONAL SALINITY VARIATIONS IN CLEVELAND BAY, NORTHERN QUEENSLAND,

James Cook Univ. of North Queensland, Townsville (Australia). School of Biological Sciences.
T. Walker.
Australian Journal of Marine and Freshwater Research, Vol 32, No 1, p 143-149, 1981. 5 Fig, 11 Ref.

Descriptors: *Salinity, *Runoff volume, *Evaporation, Estuaries, *Cleveland Bay, Burdekin River, *Australia, Great Barrier Reef, Lagoons, Rivers, *Seasonal variation.

Salinity was determined weekly on the surface and at 1 meter from the bottom at various stations in Cleveland Bay, Australia, during the period July 1976 to August 1979. Salinity varied from year to year and from season to season. There was a correlation between minimum salinity (27 to 33 o/oo) and high river discharge during rainy periods, generally January-March. Salinities remained high (35-36 o/oo) during the dry months from about September to the beginning of the rainy period. Maximum differences between surface and bottom salinities were no greater than 1 o/oo in a wet year and 0.1 o/oo in a dry year. During the dry months the surface salinity in near-shore, shallow water was 1 o/oo more saline than offshore, deeper water, as a result of evaporation. (Cassar-FRC)

FINE STRUCTURE OF SALINITY IN THE WATER OFF THE DANUBE ESTUARY,

Institute of Biology of the Southern Seas, Sevastopol (USSR).
V. I. timoshchuk, and N. S. Risik.
Hydrobiological Journal, Vol 16, No 4, p 80-85, 1980. 7 Fig, 7 Ref.

Descriptors: *Salinity, *Estuaries, *Danube estuary, Chemical properties, Salinity currents, Water currents, Water quality, Rivers, Europe.

The object of the study was to establish the fine structure of salinity in the sea area off the Danube estuary and to determine its principal variables. Water temperature and salinity were determined at depths of 0.5, 7, 10, and 15 meters, and currents were recorded at depths of 0, 5, and 10 meters. At the start of the observation period a 2-layered current was recorded. The surface current, the velocity of which was 5-20 cm/sec, coincided with the direction of the wind, but its direction was reversed in the thermohalocline (5-7 meters), where its velocity was 5-20 cm/sec. A current of compensational origin, the velocity of which varied between 5 and 13 cm/sec, was noted in the benthopelagic zone. When wind direction changed, the change was accompanied by an appreciable reconstruction of the currents in a definite sequence. Upon comparing the vertical profiles of salinity obtained by gradient water bottle and by standard procedures the values were found to coincide at depths of 0.5, 10, and 15 meters. The action of the wind on the surface of the water caused a current coinciding in direction with the wind and induced a counterflow in the pycnocline. Movement of the water toward the wind also develops immediately beneath the pycnocline. The study concluded that the main fine structure elements in the sea in front of the Danube are distinguishable on vertical salinity profiles from gradient water bottle data. The formation and variability of vertical structural heterogeneities is connected with the effect of the wind. There is a statistically significant reduction in the effect of the variability of structural heterogeneities between the surface and the bottom. (Baker-FRC)

THE VARIATION IN SUSPENDED SEDIMENT AND WATER PROPERTIES IN THE FLOOD-WATER FRONT TRAVERSING THE TIDAL FLAT,

New Hampshire Univ., Durham. Jackson Estuarine Lab.
F. E. Anderson.
Estuaries, Vol 3, No 1, p 28-37, March, 1980. 9 Fig, 2 Tab, 41 Ref.

Descriptors: *Tidal flats, *Floods, Sedimentation, *New Hampshire, *Sediment transport, Physicochemical properties, Water properties, Temperature effects, Salinity, Chemical analysis, Chemical properties, Suspended sediments, Estuarine environment.

The changes in water and sediment properties were examined in an estuarine environment with progressive flooding of the intertidal zone. Day-to-day changes in water temperatures, salinities, and particulate matter concentrations were examined, and changes in sediment concentrations occurring across the tidal flat during flooding were examined. The study site was a tidal flat adjacent to the Jackson Estuarine Laboratory of the University of New Hampshire. The study revealed that heat was gained or lost from the flood front during its passage across the tidal flat, depending on the time of flooding as well as on insolation. While water temperature changes were great across the middle and upper intertidal zones, there was little relationship between water temperature and the particulate matter concentration. Salinities increased from the middle to upper intertidal zones in the flood front, regardless of sampling time or insolation. The particulate matter concentration appeared related to the interaction of small ripples with varying bottom slopes in the intertidal zone. The amount of particulate matter between stations was extremely variable and appeared related to coarser sediment alternately being resuspended and settling during flooding. The size of the particulate matter appeared coarser in the upper intertidal zone, where the bottom slopes were steeper and wave resuspension was more effective. (Baker-FRC)

CARBON DIOXIDE ASSIMILATION, PHOTOSYNTHETIC EFFICIENCY, AND RESPIRATION OF A CHESAPEAKE BAY SALT MARSH,

Smithsonian Institution, Rockville, MD. Radiation Biology Lab.
B. G. Drake, and M. Read.
Journal of Ecology, Vol 69, No 2, p 405-423, July, 1981. 9 Fig, 2 Tab, 44 Ref.

Descriptors: *Salt marshes, *Assimilative capacity, *Carbon dioxide, Diurnal distribution, Mathematical models, Photosynthesis, Respiration, *Chesapeake Bay, Estuarine environment.

The difference between net community CO2 accumulated during the day and the amount lost at night were determined for two Chesapeake Bay salt marshes during a typical season. A model for net community CO2 assimilation was constructed, based on the seasonal patterns of solar radiation, community photosynthetic efficiency, and respiration. The maximum value for day-time net CO2 assimilation per unit area of salt marsh between sunrise and sunset was 0.95 mol/m in June. Net CO2 assimilation by both communities during the summer accounted for 3.5 plus or minus 0.9% of the incident photosynthetically active radiation. The model estimated total CO2 assimilation for the entire growing season to be 62 mol/sq m. Photosynthetic efficiency from June to August was 1.9% but the net ecosystem efficiency was 0.8%, equivalent to 0.4% of total solar radiation. (Small-FRC)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

SEA WATER DISTILLATION IN JERSEY AND ITS USE TO AUGMENT CONVENTIONAL WATER RESOURCES,

Jersey New Waterworks Co. (England).
J. M. Hobbs.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 2, p 115-128, March, 1980. 8 Fig, 3 Tab.

Descriptors: *Seawater, *Water supply, *Water treatment, *Desalination, *Distillation, Coastal waters, Distilled water, Reservoirs, Boreholes, Long-term planning, Management planning, Projections, Technology, Design criteria, Cost analysis, Urban planning.

The factors that led to the building of a 6.8 million liter per day distillation plant in Jersey in 1969 are outlined. Operational problems and the costs of the plant and the water produced are discussed. Construction of a desalination plant was in response to projected water demands and to the popularity of desalination procedures in 1965, when the plant was first proposed. Operational problems have been relatively routine. The evaporator has scaling and corrosion problems. Abrasion of the pump impellers, jamming of motor seals in the sea water intake, and difficulties with feed water pumps are among the most significant problems. The largest expense is for fuel oil, the price of which has increased sharply due to international decisions. Unless there are substantial environmental considerations to take into account, less expensive means of storing surplus winter rain would be preferable to desalination. (Titus-FRC)

SCANNING ELECTRON MICROSCOPY STUDY ON REVERSE OSMOSIS MEMBRANES PREPARED FROM INDIAN CELLULOSIC POLYMERS,

Water Pollution Control Board, Baroda (India). Gujarat Regional Lab.
R. N. Kapadia, and V. P. Pandya.
Desalination, Vol 34, p 199-215, 1980. 12 Fig, 2 Tab, 9 Ref.

Descriptors: *Reverse osmosis, *Membrane processes, Membrane filters, *Cellulose acetate membranes, Desalination.

Indigenous cellulosic polymers were used to prepare five different reverse osmosis (RO) membranes under optimized conditions. The casting solutions were prepared by dissolving the polymer in a known quantity of the solvent and subsequently adding swelling agents in specific proportions. The entire mass was mixed to prevent acetone from escaping. Casting solutions were pressure filtered to remove undissolved particles and fibers. Membranes were cast in a flat sheet. In cross sectional studies, membranes were fixed vertically; for top surface studies, membranes were fixed horizontally on the sample holder. They were then immpersed in liquid nitrogen and coated with an Au-Pd alloy by evaporation under vacuum. Silver paint was applied to ensure that the specimen was at ground potential. The membranes prepared were cellulose diacetate, cellulose triacetate, cellulose indigenous acetate blend, cellulose di-tri acetate blend, and cellulose diacetate-polymethyl methacrylate blended membranes. Studies of the morphology and performance suggest that optimization conditions should be established so that the scanning micrograph shows a uniform top layer and the cross section shows a thin dense layer. The layer below the dense layer should have graded layers communicating with a large number of pores of inter-cellulose triacetate, either separately or blended in the component system, may lead to RO membranes showing product water flux above 10 fgd and solute rejection above 92%. SELECTION OF IRRIGATION SYSTEMS FOR LAND APPLICATION OF MUNICIPAL WASTEWATER,

Williams and Works, Grand Rapids, MI.
J. C. Sutherland, and E. A. Myers.
Public Works, Vol 112, No 10, p 69-72, 91-92, October, 1981. 3 Fig.

Descriptors: *Wastewater irrigation, *Soil types, *Drainage, *Agriculture, Water table, Groundwater, Discharge, Watersheds, Flow, Seasonal variation, Sprinkler irrigation, Surface irrigation, Irrigation design, Land disposal, Land management, Water reuse, Land application, Municipal wastewater, Impaired water use.

Criteria for the selection of irrigation systems for land application of municipal wastewater are discussed. The major considerations are land costs, climate, and soil and groundwater characteristics. Soil texture must be evaluated along with the expected management practices and types of crop production. Groundwater quality, depth and direction of flow must be considered, in addition to potential seasonal fluctuations and the potential for manipulation. Three general irrigation processes are described. Rapid infiltration, slow-rate infiltration, and overland flow differ in their annual application amounts, averaging 80, 6, and 10 feet, respectively, where wastewater is applied for 6 months of the year. (Titus-FRC)

PP AND L USES DISCHARGE WATER FOR FISH FARMING.

Power Engineering, Vol 85, No 10, p 96, October, 1981. 1 Fig.

Descriptors: *Aquaculture, *Fish, *Powerplants, Water reuse, Heated water, Wastewater, Wastewater disposal, *Fish farming, *Catfish, Pennsylvania.

An aquaculture plant is being opened by Pennsylvania Power and Light Co. at its Brunner Island powerplant along the Susquehanna River south of Harrisburg. Catfish are being grown in an atmosphere enhanced by the warm water discharging from the plant. The commercial success of the project can be realized in two ways. First, a good use has been found for the waste heat from the powerplant. Second, a good source of food energy has been found at low cost. Under normal conditions in that area catfish may grow to about one pound in two to three years. Under the enhanced warmth, this same size can be attained in 32 to 36 weeks. The water is maintained between 80 and 85 degrees F, a temperature at which catfish thrive. By the time the project is completed, it is estimated that 500,000 lb of fish can be produced in a year. It is felt that the catfish may be used by the fast food chains now serving increasing amounts of fish. Other species than catfish may also be attempted. (Baker-FRC)

LAND APPLICATION OF WASTEWATERS: AN OVERVIEW.

D. B. Aulenbach.
Clearwaters, Vol 10, No 1, p 9-10, March, 1980.

Descriptors: *Wastewater disposal, *Land disposal, *Wastewater irrigation, Spray irrigation, Heavy metals, Overland flow, Infiltration.

The use of wastewaters for irrigation and fertilization of growing crops was practiced at least 400 years ago. At present, the concept of land application of wastewater takes on three major ideas: spray techniques used for irrigation, overland flow used for both crop production and wastewater renovation, and rapid infiltration used for treatment and recharge of groundwater. In spray irrigation the basic principle is to provide just enough liquid to support the roots of the crops to be grown and gain some fertilizer value from the wastewaters applied. Chlorination is recommended for any wastewaters applied to a food crop that is consumed without cooking. The overflow technique involves applying a thin sheet of water over a gently sloping field. The liquid flows over the surface of the ground, providing moisture to the roots and using the stem as a surface for attachment of bacteria that will consume the organic material in the applied wastewater. The rapid infiltration technique requires the use of relatively coarse soil or sands for the disposal system. A basin is carved into a sandy soil to above 1 meter depth. Wastewater is applied to a depth of 0.3 to 0.7 meters and the liquid allowed to infiltrate the soil, followed by about one day's drying prior to the next application. In general these treatments are inexpensive. The uptake of undesirable materials by the plants may be overcome by growing a non-edible crop such as trees or grass. (Baker-FRC)
W82-02650

WATER RECLAMATION BY THE USE OF SOIL-TURFGRASS SYSTEMS IN THE SOUTHWEST USA,

Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
I. L. Pepper, W. R. Kneebone, and P. R. Ludovici.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168626, Price codes: A04 in paper copy, A01 in microfiche. Project Completion Report, 1981. 49 p, 40 Tab, 9 Ref. OWRT-B-072-ARIZ(1), 14-34-0001-9106.

Descriptors: *Reclaimed water, *Secondary wastewater treatment, *Groundwater recharge, *Land disposal, *Turfgrasses, Filtration soil-water-plant relationships, Water pollution control, Water reuse.

Application of wastewater to a soil-turf filter in excess of consumptive use allows reclamation of wastewater in the form of leachate into ground waters. This study investigated the maximum rates of effluent which could be applied to soil-turf filters without harming turfgrass or water quality of leachate. Recharge increased with rates of application and decreasing clay content of soil. Overall recharge was affected little by the type of grass grown as long as the grass was actively growing. Recharge was at a maximum in the winter and a minimum in the summer. Linear regression equations relating recharge to effluent loading rates were developed allowing prediction of recharge for a given rate with a given clay content. Nitrate nitrogen leachate concentrations are likely to be the limiting factor in determining the maximum loading rate for any given filter. Nitrate values increased with increased rate of application and decreased clay content. Values peaked during the cold months of December, January and February, and the hot summer months of June and July. Linear regression equations for each soil, and for different seasons were developed. These equations allow prediction of the maximum effluent loading rate which can be applied and still keep leachate NO3-N concentration less than 10 ppm. Boron, P and Na, Ca and Mg values of leachate were low, and not hazardous to water quality or turfgrass. Both virus particles and coliform bacteria were effectively removed by all soil filters listed.

3E. Conservation In Industry

COMBINED FLUE GAS DESULFURIZATION AND WATER TREATMENT IN COAL-FIRED POWER PLANTS,

Environmental Protection Agency, Research Triangle Park, NC. Utilities and Industrial Power Div.
R. H. Borgwardt.
Environmental Science and Technology, Vol 14, No 3, p 294-298, March, 1980. 4 Fig, 2 Tab, 14 Ref.

Descriptors: *Water reuse, *Powerplants, *Cooling water, *Wastewater treatment, Water treatment, Water conservation, Air pollution, Coal, Fuel, Boiler water, Industrial water, Water pollution control, Sulfur, Electric powerplants.

An improvement in powerplant water reuse efficiency and a reduction in the uncontrolled discharge of soluble salts and trace elements were attained by adding sodium sulfate to the flue gas desulfurization (FGD) limestone scrubbers and including a water treatment unit such as the vapor compression evaporator. It was possible to replace all the makeup water with cooling water blowdown containing up to 690 ppm Na+ (for low-sulfur coal) when operating under appropriate conditions (less than 2500 ppm SO2 in flue gas at a Na+ level of 15,000 ppm in the scrubbing liquor or 3000 ppm SO2 and 8000 ppm Na+). By integrating the water treatment system into the FGD, rather than into the cooling water blowdown stream, water recovery was increased 50% because the FGD scrubber preconcentrates the blowdown prior to water treatment. In addition, the evaporator produces high-quality condensate usable as boiler makeup water. (Cassar-FRC)

3F. Conservation In Agriculture

PLANTING DATE AND WATER DEFICIT EFFECTS ON DEVELOPMENT AND YIELD OF IRRIGATED WINTER WHEAT,

Southwestern Great Plains Research Center, Bushland, TX.
J. T. Musick, and D. A. Dusek.
Agronomy Journal, Vol 72, p 45-52, January/February, 1980. 6 Fig, 2 Tab, 14 Ref.

Descriptors: *Water stress, *Wheat, *Irrigation effects, Crop yield, Grain crops, Water deficit, Plant growth.

Three planting dates (Sept. 15, early; Oct. 12, normal; and Nov. 7, late) and 4 to 6 water deficit treatments were evaluated with 2 short winter wheats, TAM W-101 and Vona. Early and normal planting as compared with late planting increased dry matter and grain yield and favored development at all stages: phenological level, vegetative period, blooming period, and tillering. Plant water deficits were selected to cause water stress at 1 or more of the following stages: leaf and tiller vegetative growth, spikelet differentiation to late boot-heading, and flowering through grain filling. Plant water deficits reduced yields of wheat by increasing tiller and stem senescence and grain numbers. The yields of both varieties were similar, but Vona had smaller and more numerous grains. TAM W-101 was more resistant than Vona to severe desiccation and tiller stem senescence under severe water deficits. (Cassar-FRC)

RESPONSE FUNCTIONS OF CROPS YIELD TO SOIL MOISTURE STRESS,

Escuela Nacional de Agricultura, Chapingo (Mexico). Colegio de Postgraduados.
E. V. Palacios.
Water Resources Bulletin, Vol 17, No 4, p 699-703, August, 1981. 10 Ref.

Descriptors: *Soil moisture deficiency, *Crop yield, Estimating equations, Mathematical studies, Economic aspects, Plant growth, Available water, Irrigation, *Irrigation efficiency, Irrigation practices.

Efforts were made to define a methodology for determining an optimal irrigation policy to attain a maximum economic yield of crops or, in rain fed farming, to forecast the effect of various precipitation regimes on crop yield by means of a simulation model of the soil-plant-atmosphere system. The method is based on an empirical response function, relating crop yield to soil moisture stress in different stages of plant growth. The function was developed from data obtained during field experiments on several crops and may be useful in determining when and how much to irrigate. A mathematical expression was also derived from that function which estimates the economic loss if irrigation is not applied at the opportune moment. (Baker-FRC)

INFLUENCE OF IRRIGATION RHYTHM AND WATER SUPPLY ON GROWTH, WATER STATUS AND YIELD OF EGG-PLANT (SOLANUM MELONGENA L.),

Institut National de la Recherche Agronomique, Paris (France).
P. Cornillon, and P. Dauple.
Plant and soil, Vol 59, No 3, p 365-379, 1981. 6 Fig, 2 Tab, 11 Ref.

Descriptors: *Irrigation requirements, *Eggplants, *Crop yield, Evapotranspiration, Water use, Water requirements, Consumptive use, Trickle irrigation, Furrow irrigation, Plant growth, Soil-water-plant relationships, France.

Irrigation regimes were tested on two varieties of eggplant grown in France on St. Paul silt loam during 1975 and 1976. Best marketable fruit yield was produced by irrigation amounting to 80% of the potential evapotranspiration. Daily trickle irrigation produced better fruit yields than did biweekly furrow irrigation. The cultivar Violette de Barbentane produced 20% more fruit and used less water than Ronde de Valence. Violette, of tropical origin, responded better to trickle irrigation, and Ronde de Valence, a northern variety, responded better to furrow irrigation. (Cassar-FRC)

WATER LEVELS AND LOSSES AND CLEANING IN WATERCOURSES,

Pakistan Water and Power Development Authority, Lahore.
M. Akram, W. D. Kemper, and J. D. Sabey.
Transactions of the ASAE, Vol 24, No 3, p 643-650, May/June, 1981. 16 Fig, 1 Tab, 8 Ref.

Descriptors: *Water loss, *Irrigation ditches, *Vegetation effects, Revegetation, Cleaning, Water level, Hydraulic roughness, Water conservation.

The role of cleaning in reducing earthen watercourse water loss was explored. First, an operating level was determined for two waterways. The rate of flow in the watercourse was determined, and the water width was determined at 3 cm above operating level. The watercourses were cleaned by removing the grass from the sides and bottom of the channels along with a little sediment. After cleaning, the water level was determined with respect to the datum marks (3 cm above operating level before cleaning). Earthen watercourses are generally designed by assuming a roughness coefficient in Manning's equation of 0.04, and the roughness coefficient of a smooth earthen ditch is closer to 0.03. Thus, the water level in a clean watercourse will be a few centimeters lower than the designed level. Economically, the optimum time for cleaning will depend on the value of the water that will be saved, the cleaning cost, and the functional relation between loss rate and water surface level. Ponding and recession measurement of water loss are simple and economic ways to help determine the optimum schedule for cleaning. (Small-FRC)

MANAGEMENT OF SOIL WATER BUDGETS OF RECHARGE AREAS FOR CONTROL OF SALINITY IN SOUTH-WESTERN AUSTRALIA,

Western Australia Univ., Nedlands. Dept. of Agronomy.
R. H. Sedgley, R. E. Smith, and D. Tennant.
Agricultural Water Management, Vol 4, No 1/3, p 313-334, 1981. 4 Fig, 2 Tab, 35 Ref.

Descriptors: *Soil water, *Water conservation, *Salinity, Cropland, Water resources development, Farming, Cereal crops, Grain crops, Farm management, *Australia.

Theory relating to analysis and simulation of soil water budgets in recharge areas is outlined. Ways in which their components may be affected by the interaction between weather patterns and changes caused by clearing of the original deep-rooted flora are summarized. Limited local data from the cereal belt are presented to indicate the scope for minimizing recharge by agronomic approaches. Recharge is simulated as a function of rainfall patterns in a first step toward a systematic analysis of the control of salinization by management of recharge. The objective in controlling salinity by better management of recharge areas is to increase evapotranspiration. This largely involves increasing the duration and extent of plant cover. Management of water budgets in recharge areas involves two processes. First, recharge must be minimized below root zones of agricultural species by careful selection and cultivation of deeper-rooted agricultural types. Secondly, interception and extraction of recharge below the root zone of agricultural species must be carried out by strategic placement of deep-rooted indigenous or exotic tree species. Water budgets in recharge areas can be modified through better management of subterranean clover pastures, replacement of such pastures with a grain legume phase using lupins, or with cereal-legume mixtures. Better adapted and higher yielding wheat cultivars for closer rotations and the development of cereal cultivars and clover strains with root systems better able to extract water at depth will also help. RESOURCE ALLOCATION IN A SIERRA-NEVADA FOOTHILL BEEF COW-CALF OPERATION THROUGH LINEAR PROGRAMMING,

California Univ., Davis. Dept. of Agronomy and Range Sciences.
D. M. Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168543, Price codes: A11 in paper copy, A01 in microfiche. PhD Dissertation, March, 1981, 221 p, 14 Fig, 31 Tab, 3 Append. (California Water Resources Center Project UCAL-W-495). OWRT-B-175-CAL(9).

Descriptors: *Range management, *Cattle, *Ranges, *Grazing, Forages, Fodder, Economics, Model studies, Sensitivity analysis, Productivity.

Using a Sierra-Nevada foothill beef cow-calf operation as a case study, two methods of developing the production coefficients needed to develop a profit maximizing linear programming model were compared. One method, called the grazing record method, used existing grazing records and historical stocking rates as a data base for deriving production coefficients. The other method, called the forage production method, used estimates of seasonal forage production from the literature augmented by the results of a dynamic simulation model (ELMAGE) to derive needed production coefficients. In both models a cow-calf operation producing weaner calves was selected over purchased stocker steers or calcus held over and seed or yearlings. In the grazing record model none of the possible range improvements were chosen. Sensitivity analysis showed the optimal solution to be robust to both decreases in the price of various improvements and increases in cattle prices. The optimal solution of the forage production model included nitrogen fertilization of open rangeland and the purchase of alfalfa har or profitable sources of additional feed. Sensitivity analysis indicated that these two fed sources were economically interchangeable. But both models showed a shortage of feed in the inadequate green feed period to be limiting to beef production and ranch income. It was concluded that until a much larger data base is accumulated for seasonal forage production and nutrient requirements for cattle on range, the grazing record method is as illiminating to the ranch operator decision maker as the more demanding forage production model. 4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

COMPUTERIZED CONTROL OF AN OPEN-CHANNEL WATER DISTRIBUTION SYSTEM,
Arizona State Univ., Tempe.
D. D. Zimbelman.
PhD Dissertation, May, 1981. 316 p, 55 Fig, 10 Tab, 44 Ref, 6 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-17192.

Descriptors: *Water distribution, *Open channel flow, *Algorithms, Water demand, Automation, Computers, Water control, Water level.

The objective of this research was to develop an algorithm for the computerized control of an open-channel water distribution system that would allow the system to be operated on a demand basis rather than on a scheduled basis. Downstream control introduces water into the system in direct proportion to the amount of water withdrawn. The input to the algorithm is the water surface upstream of each control structure. The output from the algorithm is an adjustment in gate opening to be implemented at the adjacent upstream control structure. The adequacy of the algorithm was verified by simulating the interaction between the algorithm and two different typical canal systems. On each canal, six cases representing automated control and four cases representing manual control were simulated. These simulations were used to first establish viability of the algorithm in an automated control environment, and secondly to compare automated control to manual. It is the conclusion of this research that the control algorithm is capable of controlling an open-channel water distribution system at a higher level of efficiency than manual control, where efficiency is measured in terms of the stability of the water surface elevations within the system. SUPPLEMENT TO PREDICTIVE MODELING OF EFFECTS OF THE PLANNED KINDRED LAKE ON GROUND-WATER LEVELS AND DISCHARGE, SOUTHEASTERN NORTH DAKOTA,
Geological Survey, Bismarck, ND. Water Resources Div.
C. A. Armstrong.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $8.25 in paper copy, $6.00 in microfiche. Geological Survey Open-File Report 81-646, June 1981. 15 p, 1 Fig, 3 Plates, 39 Ref.

Descriptors: *Model studies, *Preimpoundment, *Reservoir sites, Dam construction, Planning, Forecasting, *Groundwater level, Groundwater movement, Aquifer characteristics, Surface groundwater relations, Water table, Hydraulic conductivity, Recharge, Evapotranspiration, Computer models, Water level fluctuations, *North Dakota, *Sheyenne River.

A digital model was used to describe a groundwater system in glacial deltaic deposits near Kindred, N.D., and to predict the effects on groundwater levels of a planned lake at the 950-, 960-, 970-, 984-, and 995-foot stages. Model analysis indicates that only the area within a radius of about 2 miles of the dam on the present Sheyenne River would be affected by rising water levels as a result of a lake stage at 995 feet. The rise of water levels depends on time and hydraulic properties of the aquifer. The maximum projected rise in water levels at the various stages should occur in about 50 to 100 years. Evapotranspiration and existing drains will be effective in limiting the extent of water-level rise. (USGS)

TECHNICAL AND ECOLOGICAL IMPACTS OF THE HIGH ASWAN DAM,
Yarmouk Univ., Irbid (Jordan). Dept. of Civil Engineering.
A-A. I. Kashef.
Journal of Hydrology, Vol 53, No 1-2, p 73-84, September, 1981. 1 Fig, 2 Tab, 20 Ref.

Descriptors: *Dams, *Environmental effects, *Erosion control, Weirs, *Nile River, *High Aswan Dam, *Irrigation effects, Water resources development, Ecological effects, Channel erosion, Beach erosion, Bank erosion, Silting, Reservoir silting, Human diseases, Fishing, Watershed management.

The High Aswan Dam was constructed in 1952 to provide for the irrigation demands of agricultural expansion, to generate electricity, to supplement the water supply during low-stage years and to protect the land from high floods. Channels from the reservoir downstream of the dam are to be used in a new irrigation project to feed the Western Desert areas. A proposed submerged weir could improve the performance of the channel by diverting lost silts back to Egypt. The diverted silts would lessen the need for chemical fertilizers, prevent erosion along the Nile and other waterways, and hinder the advance of the Mediterranean shoreline. Other environmental impacts that have been associated with the High Aswan Dam since its building include the deterioration of Mediterranean summer resorts due to beach erosion, the spread of water-borne diseases, the flooding of villages near the dam reservoir, and losses suffered by the fishing industry due to the lack of silting along salmonid spawning areas. 4B. Groundwater Management

AN ECONOMIC ANALYSIS OF GROUND WATER MANAGEMENT ALTERNATIVES,
Nebraska Univ., Lincoln. Dept. of Agricultural Economics.
D. A. D. Comer.
PhD Dissertation, 1981. 147 p, 11 Fig, 24 Tab, 37 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-13280.

Descriptors: *Groundwater management, Groundwater storage, *Economic aspects, *Model studies, Groundwater mining, Water resources development, Income, Agriculture, Aquifers, *Nebraska, Upper Big Blue Natural Resources District.

Alternatives for managing existing ground water are similar for all areas facing ground water mining problems. The specific impact of an option will depend upon the specific hydrologic and soil characteristics of the area, the cropping patterns, and climatic conditions. These factors lend themselves well to a case study approach. Within Nebraska, there are several areas with ground water mining problems and one of these areas, the Upper Big Blue Natural resources District has been selected as the study area. Several options are examined to see how they impact on farm and regional income over time. The objectives were to evaluate the impacts of options on farm level income, on aggregate farm income and on the aquifer. The model was structured to determine how producers might respond to three-year allocations. A recursive, polyperiod linear program formed the basis of the farmer's decisions. The polyperiod component was necessary to reflect the opportunity cost of using water in year one rather than year two or three. It was recursive to allow for reflection of the impact of action in earlier years on costs in subsequent years. Producers were assumed to plan based on average values but could adjust their intentions according to the weather conditions. A 400-node, three dimensional finite element hydrologic ground water model was used to simulate the impact of annual pumpage on the aquifer. New pump costs were estimated annually to reflect changing aquifer conditions. (Sinha-OEIS)

MANAGING CRISIS: THE EFFECTIVENESS OF LOCAL DISTRICTS FOR CONTROL OF GROUND WATER MINING,
Colorado Univ., Denver. Graduate School of Public Affairs.
L. F. Keller, C. G. Heatwole, and J. W. Weber.
Water Resources Bulletin, Vol 17, No 4, p 647-654, August, 1981. 8 Fig, 3 Tab, 10 Ref. OWRT-B-046-KAN(3).

Descriptors: *Groundwater mining, Management, Decision making, Water supply development, Water management, *Groundwater management, Water supply, Available water, Design criteria, *Ogallala Aquifer, Legal aspects, Public opinion, Political aspects, Surveys.

The willingness and ability of local districts to control groundwater mining of the Ogallala Aquifer in the High Plains has been studied. A survey was conducted among district officials, irrigators, and citizens. While the assessment is preliminary in nature, it is possible to highlight critical issues concerning effectiveness of districts in dealing with the problem. Most of the states experiencing groundwater mining are using local groundwater districts or more broadly based Natural Resource Districts. Though the exact authority granted to districts varies, their importance as the policy focus for dealing with groundwater mining will probably continue to expand. Districts do appear to have potential effectiveness. A local consensus has developed that ground water mining problems are serious, and that controls such as metering and well spacing are needed. District officials appear to have some expertise in the area and are dedicated to service to the local community. However, there does not appear to be a similar feeling of agreement regarding additional regulatory policies. Most of those surveyed appear willing to change

some behavior, but there does not seem to be much interest in going beyond the minimum change. It may be difficult to mobilize popular support for regulatory policies, as district officials oppose regulation more strongly than does the general population. In New Mexico, however, more extensively planned and regulated use of groundwater is taking place. In this area the management district becomes more of a service agency, maintaining meters and brokering marketable permits, rather than conducting research or making basic policy. (Baker-FRC)

METHOD OF CONSTRUCTING A SYSTEM FOR CONTROLLING REGIONAL EXPLOITABLE GROUNDWATER RESOURCES,
Moscow State Univ. (USSR).
V. S. Zil'berg, and M. S. Krass.
Water Resources (English Translation), Vol 7, No 6, p 536-545, November/December, 1980. 8 Ref. Translated from Vodnye Resursy, No 6, p 108-119, November-December, 1980.

Descriptors: *Groundwater management, *Control systems, *Linear programming, Computers, Computer models, Groundwater availability.

A control system for regional exploitable groundwater resources is an algorithm which should provide for determination of the capacity of any number of operating and planned intakes arbitrarily arranged within the investigated territory. It will deal with three things: initial information, prediction of the capacity of oriented intakes, and optimization of the number of intakes, their capacity, and location. Problems can be formulated and reduced to linear programming. They can be solved using computers. High speed computers can solve the problems quickly; this facilitates the optimization of the number of intakes, their capacity, and location within a large region. In the future, real time programming can be used in control systems. (Small-FRC)

SCIENTIFIC AND TECHNICAL ASPECTS OF THE RATIONAL USE AND CONSERVATION OF GROUNDWATERS IN THE UKRAINIAN SSR,
Ministerstvo Geologii, Moscow (USSR).
N. I. Beseda, and P. I. Yakovenko.
Water Resources (English Translation), Vol 7, No 6, p 528-536, November-December, 1980. 5 Tab, 7 Ref. Translated from Vodnye Resursy, No 6, p 97-107, November-December, 1980.

Descriptors: *Groundwater management, *Water conservation, *Groundwater potential, Water management, Groundwater depletion, Ukrainian SSR.

Management of groundwater resources in the Ukrainian SSR was investigated because about 23% of the resource has been used in each of recent years. The first step is the estimation of exploitable groundwater supplies, which requires a regional study and the quantitative evaluation of exchange between ground and surface waters. A survey of the Ukrainian SSR indicated that about 50% of all resources are confined to the Dnepr-Donets artesian basin, and about 24% are concentrated in the Volyn-Podolia basin. Current groundwater withdrawals amount to about 12.9 million cu m/day. Groundwater resources in 30% of the Ukraine are insufficient to meet future needs, but when the Ukraine is looked at as a whole, if use of surface water is reduced in the northern regions, there should be sufficient groundwater in the southern regions. Suggestions are presented for promoting rational use and conservation measures in the arrea. (Small-FRC)

AQUIFER THERMAL ENERGY STORAGE: A NUMERICAL SIMULATION OF AUBURN UNIVERSITY FIELD EXPERIMENTS,
California Univ., Berkeley. Lawrence Berkeley Lab.
C. F. Tsang, T. Buscheck, and C. Doughty.
Water Resources Research, Vol 17, No 3, p 647-658, June, 1981. 20 Fig, 5 Tab, 36 Ref.

Descriptors: *Aquifer management, *Energy storage, Geothermal studies, Computer models, Model studies, Groundwater management, *Thermal water, Wells, *Injection wells, Water storage, Auburn University, Confined aquifers.

A computer simulation of two 6-month cycles of injection-storage-production of hot water in confined aquifers, the Auburn University Thermal Energy Storage Project, agreed very well with field data. The first cycle involved the injection and recovery of about 55,000 cu m of water, heated to an average of 55.2 degrees C, in 79 days. The warm water was stored for 52 days, then pumped out until the recovered water temperature fell to 32.8 degrees C. By that time, 66% of the water had been recovered. The second cycle was similar, although somewhat more prolonged, and 76% of the energy injected was recoverd. Although there were discrepancies between calculated and experimental data in the detailed temperature distribution comparisons, some cancelled themselves during the injection-production process, so that final prdduction temperatures were very well simulated. (Cassar-FRC)

INJECTION, RECHARGE AND RETURN WELLS,
T. Gass.
Water Well Journal, Vol 35, No 10, p 36-37, October, 1981.

Descriptors: *Wells, *Groundwater management, Injection wells, Recharge wells, Return wells, Water pollution sources, *Groundwater recharge, Groundwater contamination, Aquifer management.

Definitions are proposed for three types of wells (injection, recharge, and return) in order to alleviate the confusion caused by interchangeable use of these terms. An injection well is a well into which water, gas, or liquid waste is injected under pressure or gravity flow to dispose of wastes and/or maintain formation pressures. These wells pose the highest risk to the environment. A recharge well is a well into which water is allowed to flow by gravity or injected under pressure for the purpose of aquifer management. The recharge water must be of sufficient quality so that the groundwater quality is not degraded. A return well is a well into which water that was previously withdrawn for heating or cooling purposes is returned to the same aquifer. Water quality of return water should be comparable to that of the water originally drawn. (Cassar-FRC)

THE INFLUENCE OF STREAM SALINITY ON RESERVOIR WATER QUALITY,
Western Australia Univ., Nedlands. Dept. of Civil Engineering.
J. Imberger.
Agricultural Water Management, Vol 4, No 1/3, p 255-273, 1981. 9 Fig, 1 Tab, 19 Ref.

Descriptors: *Salinity, *Reservoirs, Lakes, Water quality, *Australia, Land management, Water supply, Water pollution sources, Catchments, Solute transport, Model studies, Land use, *Saline water intrusion.

The salt content of the Wellington Reservoir is examined as it may relate to the increased salinity of drylands in Western Australia. During periods of rain, the perched aquifer builds up, causing leaching of the salt accumulated by direct water ponding during the end of the previous winter and that accumulated by the upward percolation. In areas of saturation of the perched aquifer, direct runoff will occur, leading to a very rapid response of the streams. The salt stored on the surface and in the perched aquifer will be flushed out once the water has travelled a distance characterized by the width of the contributing area. Deep-rooted vegetation may prevent the buildup of the upward flows into the contributing areas and may also drain much of the perched aquifer during the winter months. The dynamic reservoir simulation model, DYRSEM, is a one-dimensional numerical simulation model for the prediction of temperature and salinity in small to medium lakes. It is based on the assumption that in such lakes the thermal structure plays a dominant role, and the isotherms are mostly horizontal planes. These assumptions place some restrictions on the applicability of the model. The major evaluation of the model was made using the Wellington Reservoir. An examination of the salinity variations in the Collie River revealed a structure dependent on the peak and base flow salinity, the phase during storms and the flushing time of the whole system. This variation was used to modify an existing salinity record to simulate possible future trends. The exact nature of salinity variations is not the most significant prediction, but the mixing in the reservoir which acts as a strong filter is important. Without drastic action, the salinity in the Wellington reservoir will become excessive in the near future. A by-pass strategy is suggested. (Baker-FRC)

ROLE OF ORGANIC DEBRIS DAMS IN REGULATING THE EXPORT OF DISSOLVED AND PARTICULATE MATTER FROM A FORESTED WATERSHED,

Cornell Univ., Ithaca, NY. Div. of Biological Sciences.
R. E. Bilby.
Ecology, Vol 62, No 5, p 1234-1243, October, 1981. 5 Fig, 5 Tab, 31 Ref.

Descriptors: *Streamflow, *Detritus, *Dams, Particulate matter, Runoff, Erosion, *Forest watersheds.

This experiment was designed to quantify the effect of organic debris dams on the export of materials from a small forested watershed ecosystem. All debris dams were removed from a 175-m section of a second-order stream, just above a gauging weir. The material being exported from the watershed was collected for one year before dam removal and for one year following removal. Export of dissolved material increased slightly following dam removal, while fine particulate matter export increased dramatically at high discharges. Coarse particulate matter export was also increased. Dam removal brought about a 6% increase in the export of dissolved matter and a 500% increase in the export of fine and coarse particulate matter. THE EVOLUTION OF A REGIONAL APPROACH TO SALINITY MANAGEMENT IN WESTERN AUSTRALIA,

Perth Public Works Dept. (Australia).
B. S. Sadler, and P. J. Williams.
Agricultural Water Management, Vol 4, No 1/3, p 353-381, 1981. 4 Fig, 3 Tab, 11 Ref.

Descriptors: *Salinity, *Water resources development, Water management, *Australia, Land use, Groundwater management, River basins, Catchment areas, Revegetation, Reforestation, Vegetation establishment, *Water pollution control, Saline water intrusion, Saline diversiions.

Efforts to contain and minimize the risk of increasing areas of dryland salinity in Western Australia are needed. To define the regional variations of the problem, south-west Australia has been divided into four zones: the coastal zone between the coast and the Darling Scarp, the high rainfall zone from the scarpeastwards to the 1100 mm rainfall isohyet, the intermediate zone with about 1100 to 900 mm of rainfall, and the low rainfall zone inland from the 900 mm isohyet. In this fourth zone salt storage is high and clearing almost invariably causes salt release. The third zone has highly variable potentials for salt release. Management strategies to control the release of salts include the prevention or limitation of clearing of the land and the restoration or amelioration of areas already cleared. Adaptation of land and water use is viewed as one means of adapting to the release of salts. Another method of adaptation may be abandonment of seeps through substitution of developed sources for alternatives. Salt disposal, reservoir management, seasonal withdrawals, saline diversions and desalination are possible means of adjusting to the release of salts by salt disposal. Dilution of salts can be obtained by blending fresh and brackish water, or by increasing runoff in salt free areas. Salt tolerant vegetation can be planted in efforts to cope with the situation. While partial reforestation, deep-rooted vegetation and deep drainage have all been proposed as possible control measures, none has yet been developed to provide economical control of salt seeps. 5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

RAINWATER ACIDITY MEASUREMENT PROBLEMS,

William and Mary Coll., Williamsburg, VA. Dept. of Chemistry.
S. Y. Tyree, Jr.
Atmospheric Environment, Vol 5, No 1, p 57-60, January, 1981. 1 Fig, 5 Tab, 19 Ref.

Descriptors: *Acid rain, *Measuring instruments, Chemical analysis, Water analysis, Rainfall, Acidity, Air pollution, Water pollution sources, Titration.

Three methods which are currently used to determine the acidity of rainwater have been studied. The first method relies on pH measurement, the second on titration, and the third assumes that any charge discrepancy in favor of anions is due to hydronium ion concentration. In this third method only strong acid is measured, and the method is used only for those solutions at or below a pH value of 5.6. The method requires the determination of concentrations of all principal ions in the rainwater sample, usually considered to be chloride, nitrate, sulfate, ammonium, sodium, potassium, calcium, and magnesium. The accuracy and reproducibility of such a method are no better than the properly combined accuracy and reproducibility of each of the principal solute ion values. The first method, the pH measurement, measures the concentration of strong acids plus some of the weak acids in rainwater. However, the accuracy and reproducibility are not sufficient. Similarly, the accuracy and reproducibility of the titration method are also unacceptable. The results of two collaborative intercomparison laboratory studies on simulated rainwater show that adequate analytical reproducibility is not being attained at present. (Baker-FRC)

TO INHIBIT OR NOT TO INHIBIT: THAT IS THE QUESTION,

E. F. Barth.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1651-1652, November, 1981.

Descriptors: *Biochemical oxygen demand, *Water analysis, *Nitrification, Ammonium nitrogen, Water quality, Water quality standards, Evaluation.

The Federal discharge standard for BOD5 content may not be achieved if ammonium nitrogen in the sample is biologically oxidized to nitrite or nitrate nitrogen. Techniques to inhibit this reaction and allow the BOD5 test to respond only to carbonaceous material are available, and the extent of this nitrification reaction is erratic and nonpredictable under conditions of the standard test. Regulatory agencies should endorse the inhibited BOD5 test to more accurately reflect carbonaceous removal efficiency in regard to municipal compliance with secondary treatment standards. The inhibited BOD5 test can be supplemented with a separate determination of total Kjeldahl nitrogen. (Small-FRC)

CONCENTRATION OF VIRUS FROM TAP WATER AT AMBIENT SALT AND PH LEVELS USING POSITIVELY CHARGED FILTER MEDIA,

University Coll., London (England). Dept. of Civil Engineering.
H. Garelick, and J. E. Scutt.
Water Research, Vol 15, No 7, p 815-816, July, 1981. 2 Tab, 18 Ref.

Descriptors: *Viruses, *Filter media, *Asbestos, *Pollutant identification, Water analysis, Water purification, Adsorption.

Positively charged asbestos filters (Carlson-Ford type 4) were investigated for the detection of coliphage f2 and poliovirus 1 from tap water at low concentrations. The adsorption was performed at ambient pH 7.8, without addition of multivalent cations. Water samples inoculated with stock virus were pressure filtered. Adsorbed viruses were eluted by passing through the filter three sucessive 25 ml volumes of concentrated nutrient broth. Eluates were neutralized with glycine and assayed individually for virus. Average recoveries of coliphage f2 from 50 ml and 20 liter volumes were 64 and 65% respectively; the average recovery of poliovirus 1 in 20 liter volume was 68%. The large variability of coliphage results may have been due to virus aggregation or disaggregation in the course of the experiments. Other nominally positive media including alumina fibers and glass fibers coated with cationic polymers were also investigated for phase recovering ability, but were much less efficient than asbestos. (Cassar-FRC)

APPLICATION OF HYDRIDE GENERATION TO THE DETERMINATION OF TRACE CONCENTRATIONS OF ARSENIC BY INDUCTIVELY-COUPLED PLASMA ATOMIC EMISSION SPECTROMETRY,

Osaka Prefecture Univ. (Japan). Dept. of Applied Chemistry.
T. Nakahara.
Analytica Chimica Acta, Vol 131, p 73-82, 1981. 3 Fig, 5 Tab, 34 Ref.

Descriptors: *Arsenic, *Detection limits, *Water analysis, Wastewater treatment, Water pollution control, Emission spectroscopy.

A proposed method for the determination of traces of arsenic was applied to the determination of ng/ml levels of arsenic in wastewaters. The detection method is based on sodium tetrahydroborate reduction of arsenic, followed by introduction of the arsine formed to a relatively low-powered inductively-coupled plasma. The method was applied to water samples collected at the inlet of the Wastewater Treatment Facility, University of Osaka Prefecture. Results indicated good agreement between the proposed method and hydride-generation-non-dispersive atomic fluorescence spectrometry. Thus, the sensitivity of the method is adequate for the determination of arsenic in wastewater. The method has a detection limit of 0.1 ng As/ml and the linear calibration range spans almost four orders of magnitude. (Small-FRC)

VOLATILE ORGANIC ACIDS IN LAKE WATER; THEIR GAS CHROMATOGRAPHIC DETERMINATION AND ECOLOGICAL SIGNIFICANCE,

Nagoya Univ. (Japan). Water Research Inst.
T. Hama, and N. Handa.

Japanese Journal of Limnology, Vol 42, No 1, p 8-19, January, 1981. 9 Fig, 2 Tab, 27 Ref.

Descriptors: *Lakes, *Volatile acids, Organic compounds, Water analysis, Chemical analysis, Chromatography, Organic acids, *Pollutant identification.

A study was conducted in an attempt to establish analytical procedures for volatile organic acids by gas chromatography after conversion of the acids to corresponding benzyl esters on the basis of the method developed by Bethge and Lindstrom, to apply this procedure to the analysis of volatile organic acids dissolved in lake water, and to understand the significance of volatile organic acids in terms of the dynamics of organic matter in lake water. Using this method only 50-250 ml of lake water was needed for determination of the volatile organic acids. The identification of benzyl esters was conducted by combined gas chromatography-mass spectrometry. Acetic, propionic, n-butyric and lactic acids were found in the water samples from Lake Kizaki. However, formic acid was identified only by the retention time in gas chromatography. Formic, acetic and propionic acids measured were in the range of 0-30 microg C/l, 30-120 microgC/l and 0-90 microgC/l, respectively, in the various depths of Lake Kizaki. To determine the molecular weight distribution of dissolved organic matter in the water samples from Lake Kizaki, gel-filtration using Sephadex G-25 was applied. Volatile organic acids consisting of formic, acetic and propionic acids accounted for 59% of the dissolved organic carbon in the fraction of organic matter with a molecular weight of less than 200. The volatile organic acids were suggested to be the most ecologically significant materials in the matter cycle in the waters of the lake. (Baker-FRC)

PARTICULATE AND DISSOLVED LIPIDS IN SEA WATER,

Texas A and M University, College Station. Department of Oceanography.
M. C. Kennicutt, II.
PhD Dissertation, 1980. 239 p, 69 Fig, 44 Tab, 190 Ref, 7 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-23041.

Descriptors: *Seawater, Water properties, Organic compounds, Variability, *Lipids, *Water chemistry, Gulf of Mexico, Scotia Sea, Cariaco Trench.

Dissolved and particulate lipid extracts were collected at a number of locations in the Gulf of Mexico, the Scotia sea, and in and near the Cariaco trench. All concentrations of lipids measured were extremely low and apparently of biogenic origin. Seasonal, diurnal, vertical, and areal variations were observed in lipid content. The dissolved lipids were less variable than the particulate lipids. The lipid content of particulate organic carbon decreased with depth. Lipid concentrations reflected variations in routine oceanographic parameters such as salinity and temperature and the aperiodicity of sources. Anoxic conditions appeared to preserve lipid materials in the particulate phase. N-alkanes may have two sources (marine and terrestrial) superimposed on a low fairly constant background of hydrocarbons caused by lowlevel chronic oil pollution in the Gulf of Mexico. Fatty acid alkyl esters may be the product of the degradation of humic substances and glycerides; as such their distribution may indicate rates of degradation and the stability of the organic matter present in aquatic environments. Indanes, phenols, benzoates, and other compounds detected in this study may prove to be useful indicators of source. Lipids of temperate climates (Gulf of Mexico) and polar climates (Scotia Sea) had similar gravimetric concentrations and similar dominant compounds. The fractionated lipids had different distributions for the two locations. (Sinha-OEIS)

ECOLOGICAL MAGNIFICATION OF PERSISTENT ORGANOCHLORINE PESTICIDES IN AN ILLINOIS WATERSHED,

Illinois Univ. at Urbana-Champaign.
J. C. Marlin.
PhD Thesis, 1980. 114 p, 2 Fig, 49 Tab, 60 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX80-26556.

Descriptors: *Water pollution, *Watersheds, *Pollutant identification, Insecticides, *Pesticides, Aquatic life, Ecology, Agriculture, Data collections, Fungicides, *Lake Decatur watershed, Illinois.

Data is provided on the accumulation of selected organochlorine insecticides in aquatic organisms in the heavily agricultural Lake Decatur watershed. Emphasis was placed on the collection of a wide vaariety of organisms in order to add to the data base on bioaccumulation within an ecosystem. DDT and DDE were chosen because they are known to be ubiquitous in the environment. Aldrin and heptachlor and their products, dieldrin and heptachlor epoxide, were selected because they have been widely used in the watershed to control soil insects, particularly corn rootworms. The fungicide HCB (hexachlorobenzene) was included since it was present in unexpectedly high concentrations in the first samples analyzed. The data show that aquatic organisms in the Lake Decatur watershed contain an abundance of organochlorine insecticide residues. Relatively high residues of aldrin and heptachlor were expected since their use was prevalent during the time data were collected. The ubiquitous presence of HCB was not anticipated. It provides another warning that the ultimate fate of chemicals in the environment should be studied prior to their use. The failure of insecticides to provide a permanent solution to insect pest problems as well as their threats to the environment and public health have prompted renewed interest in alternate control methods. Integrated pest management (IPM) combines cultural and biological control techniques with insect scouting, the judicious use of pesticides, and the acceptance of a limited amount of crop damage. THE DISTRIBUTION AND SEASONAL FLUCTUATIONS OF HETEROTROPHIC BACTERIA AND COLIFORM BACTERIA IN THE RIVERS AND ESTUARIES IN OSAKA CITY, JAPAN (IN JAPANESE),

Osaka City Inst. of Public Health and Environmental Sciences (Japan).
T. Yoshikura, K. Oda, and S. Iida.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 46, No 2, p 231-236, February, 1980. 6 Fig, 7 Ref. (English summary).

Descriptors: *Coliforms, *Bacteria, *Water pollution effects, Rivers, Estuaries, Seasonal distribution, Temperature effects, *Japan, Microbial analysis, Fate of pollutants.

Water samples were collected at several stations in the rivers and estuaries in Osaka City and analyzed for microbial and chemical content. The waters were sampled monthly from April 1974 through March 1977. Heterotrophic bacteria were determined by the standard plate count at 37 deg C. Fluctuations in heterotrophic bacteria and coliform bacteria depended upon the concentrations of organic pollutants and on water temperature. Both bacteria concentrations reached a maximum at the most polluted station. When river water was diluted in the estuaries, coliform levels were higher than other bacterial levels. The maximum number of heterotrophic bacteria occurred during the summer. (Small-FRC)

DETECTION OF OIL POLLUTANTS ON THE SURFACE OF INLAND WATERS BY A PROJECTOR-BASED OPTICAL DETECTOR,

Leningrad Electrical Engineering Inst. (USSR).
M. A. Kropotkin, T. Yu. Sheveleva, and V. A. Ivanov.
Water Resources (English Translation), Vol 7, No 6, p 582-585, November/December, 1980. 2 Fig, 2 Ref. Translated from Vodnye Resursy, No 6, p 167-171, November-December, 1980.

Descriptors: *Measuring instruments, *Oil pollution, *Optical properties, Oil spills, Oily water, Water pollution, Water properties, Weather.

An optical detector based on a light projector was evaluated on the Volga for the detection of oil spills. The detector was installed on a projecting boom mounted on the bow of the research ship so that the axis of the light beam was oriented to the water's surface. Direct and reflected solar radiation, changes in ambient air temperature, cloud cover, and light fog had no effects on the operation of the instrument. The detector operated successfully at ship speeds up to 15 knots and on fairly rough seas (wave height = 20-50 cm, wind speed to 10 m/sec). The minimum oil slick detectable was about 1.0 sq m. The optimal angle of incidence was 3-5 deg for the detection of oil pollution. The detector was used to determine the degree of oil pollution in the Volga and on Lake Baikal. (Small-FRC)

THE APPLICATION OF A WATER-QUALITY MODEL TO THE RIVER WYE, WALES,

University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
A. C. Oborne.
Journal of Hydrology, Vol 52, No 1/2, p 59-70, June, 1981. 6 Fig, 3 Tab, 14 Ref.

Descriptors: *Model studies, *Water quality, Rivers, Aquifers, Runoff, Flow, Chlorides, Phosphates, Hardness, Recharge, Chemical properties, Water pollution sources, *Wye River, *Wales.

The application of a simplified version of a flow separation model to modeling concentration changes of four water-quality determininands in the lower reaches of the River Wye was investigated. Mean daily river flows and levels of chloride, orthophosphate, total hardness and alkalinity for 1970-1977 were used to develop the model. Total river flow was assumed to consist of at least one baseflow component, a runoff component, and effluent return flows. The total mass flow of a given water quality determinand was assumed to represent the sum of the mass flows from all of these components, with correlation for the effect of storage in the river channel. A computer program with an iterative algorithm was used to obtain optimal values for the set of parameters. Performance of the model was assessed by comparing generated concentrations with observations from a data set other than that used for calibration. At least 79% of the test data variance was explained by the model for orthophosphate, alkalinity and total hardness, but only 59% for chloride. Prediction was significantly improved over that of the simple regression equation. The major source of error in the water quality model is the separation of flow into baseflow and runoff. The use of more than one baseflow component may have better represented this system. Further improvements in the quality model may also be achieved by using a longer flow record for calibration and a more complex approach to aquifer-recharge response than the present fixed recharge period approach. DIFFERENTIAL PULSE POLAROGRAPHIC DETERMINATION OF INORGANIC AND ORGANIC ARSENIC IN NATURAL WATERS,

Consiglio Nazional dele Ricerche, Bologna (Italy).
P. L. Buldini, D. Ferri, and Q. Zini.
Mikrochimica Acta, Vol 1, No 1-2, p 71-78, 1980. 1 Fig, 1 Tab.

Descriptors: *Pollutant identification, *Arsenic compounds, *Polarographic analysis, *Arsenic, Water analysis, Natural streams, Natural waters, Heavy metals, Oxidation, Anion exchange, Electrolysis.

A method for the determination of inorganic arsenic (III), arsenic (V), and organic arsenic at the microgram/liter level in natural waters by differential pulse polarography is described. For the determination of As(III), 4.2 ml of sample are transferred into a 5-ml standard flask and diluted to the mark with concentrated hydrochloric acid. After the solution is transferred to a polarographic cell and deaerated for 2 minutes, the peak heights are recorded and compared with a standard curve. For the determination of total inorganic arsenic, 100 ml of sample are placed in a 150-ml test tube to which 10 milligrams of potassium permanganate are added. The mixture is heated in the aluminum block until the volume is reduced to 2 ml. After anhydrous sodium sulfite and concentrated hydrochloric acid are added, the solution is heated for 1 hour at 90 degrees, cooled, then diluted to 5 ml in a standard flask. Polarographic analysis procedures are the same as those used for As(III). For determinations of total arsenic, 4 grams of magnesium nitrate hexahydrate and 20-50 milligrams of potassium permanganate are added to 100 ml of sample in a 150 ml test tube. The sample is subjected to nitrate removal steps. After the addition of anhydrous sodium sulfite and concentrated hydrochloric acid to the dry residue, polarographic procedures are the same as for total inorganic arsenic. Techniques to overcome Cu(II) and Pb(II) interferences are described. The overall efficiency of the method is 70-80%. (Geiger-FRC)

POLYCHLORINATED BIPHENYLS IN SEWAGE SLUDGE AND SEDIMENTS OF THE NEW YORK BIGHT,

National Oceanic and Atmospheric Administration, Miami, FL. Atlantic Oceanographic and Meteorological Labs.
R. H. West, and P. G. Hatcher.
Marine Pollution Bulletin, Vol 11, No 5, p 126-129, May, 1980. 4 Fig, 2 Tab, 25 Ref.

Descriptors: *Polychlorinated biphenyls, *Sludge, *Marine sediments, Bottom sediments, Sediments, *New York Bight, Pollutants, *Ocean dumping, Waste disposal, Spoil banks, Municipal wastewater, Bights.

The horizontal and vertical distribution of PCBs in sediments in the New York Bight were measured, and particulate and dissolved PCB concentrations were monitored over several hours following the dumping of sewage sludge in the Bight. Analyses of four sewage sludge samples demonstrated the presence of high concentrations of PCBs, in spite of the current limited use of these substances. Sampling of the surface plume shortly after ocean dumping of sewage sludge revealed dramatic increases in dissolved and particulate PCB levels. After the initial increase, an overall decrease in dissolved PCBs and increase in particulate PCBs was observed as a function of time. Large quantities of PCBs are rapidly removed from the water column by scavenging particulate matter and transported to surficial sediments over a relatively limited area, usually less than 1 to 2 kilometers in breadth. A significant concentration of PCBs is retained in the water column and remains in suspension in the mixed layer for longer periods of time. Concentration of the sedimentary PCBs in the Christiaensen Basin, where sewage sludge is known to accumulate, suggests that this sludge is the primary source of PCBs in the Bight. High PCB levels appear to be restricted to a very small area typified by mud accumulation, and widespread transport of PCBs out of the Bight is not evident. Analysis of the vertical concentrations of PCBs in a box core taken from the most heavily contaminated areas shows that the surface PCB concentration is significantly higher than concentrations detected further down in the core. The analyses indicate that high PCB levels have existed ever since widespread use of the compounds began in 1955, and that the levels of PCBs are correlated with dramatic increases in the volume of sludge dumped in the Bight since 1952. URANIUM ISOTOPES AND 226RA CONTENT IN THE DEEP GROUNDWATERS OF THE TRI-STATE REGION, U.S.A.,

Florida State Univ., Tallahassee. Dept. of Geology.
J. B. Cowart.
Journal of Hydrology, Vol 54, No 1-3, p 185-193, December, 1981. 3 Fig, 3 Tab, 10 Ref.

Descriptors: *Isotope studies, *Radium, *Drinking water, *Groundwater, Deep wells, Public health, Brines, Missouri, Oklahoma, Kansas.

Uranium isotopes 238U and 234U, precursors of 226Ra, were studied in an investigation of the unacceptably high radium concentration (greater than 5 pCi/liter) in public water supply wells in the Missouri, Kansas, and Oklahoma area. The high-Cl brine in the area may be the source of the radium. There are no appropriate samples presently available from the area, although high radioactivity has been reported from oil-field wells further west in Kansas and Oklahoma. At least part of the dissolved uranium in the westward flowing water is precipitated in the zone of mixing. The waters mix, then flow southwestward. Thus, the radium is not due to present day accumulation. (Small-FRC)

DEVELOPMENT OF A MULTIDETECTOR PETROLEUM OIL-IN-WATER MONITOR,

Rockwell International, Newburg Park, California.
R. W. Melvold.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-105206, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-206, October, 1981. 3 Fig, 1 Tab.

Descriptors: *Monitoring, *Petroleum products, *Oil, Water pollution, Fluorescence, *Oil pollution, Brackish water, Seawater, Pollutant identification.

No satisfactory commercially available instrument or concept presently exists for continuously measuring all types of oil in various physical states (free, suspended, dissolved, or emulsified) in water containing various types and concentrations of matrix materials. The complex chemical composition of petroleum-derived oils and the similarities of oil components to nonpetroleum water contaminants dictate the use of a multidetector monitoring system for the improved measurement of petroleum oil in water containing nonpetroleum contaminants. To determine the feasibility of developing a multidetector monitoring system, a survey was conducted of commercially available oil monitors. Three monitors were recommended for inclusion in the multidetector system: the Sigrist Fluorescence Monitor Model FLJ (UV fluorescence) the CE Invalco D.O. W. Monitor (UV absorbance), and the Horiba OCMA-32A Oil Content Monitor (infrared absorbance). A comprehensive evaluation of the selected oil meters was critically conducted under laboratory conditions to identify their ability to detect and quantify petroleum oil in fresh, brackish, or sea water. The multidetector concept has been demonstrated as a viable technique for the measurement of petroleum oil in water containing nonpetroleum contaminants. A preprototype multidetector system has been assembled and tested; it is a definite improvement over any single commercially available detector. (Moore-SRC)

DETERMINATION OF PHTHALATES IN INDUSTRIAL AND MUNICIPAL WASTEWATERS,

Southwest Research Inst., San Antonio, TX.
J. W. Rhoades, R. E. Thomas, D. E. Johnson, and J. B. Tillery.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-232167, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S4-81-063, October, 1981. 5 p, 3 Tab.

Descriptors: *Pollutant identification, *Municipal wastewater, *Industrial wastewater, *Phthalates, *Gas chromatography, Electron capture gas chromatography, Sample preservation, Water sampling.

As part of a series of investigations of the analytical behavior of selected priority pollutants and suitable test procedures for their measurement, the following compounds were studied: dimethyl phthalate (DMP); diethyl phthalate (DEP); dibutyl phthalate (DBP); benzyl butyl phthalate (BBP); diethylexyl phthalate (DEHP); and dioctyl phthalate (DOP). All six phthalates have been chromatographed on two columns. Column 1 is packed with 1.5% SP-2250 plus 1.95% SP 2401 on 100/120 mesh Supelcoport. Column 2 has 3% OV-1 as its liquid phase but is otherwise the same as Column 1. Investigations with both columns gave comparable results. The electron capture detector is preferred over the flame ionization detector on the bases of the greater sensitivity and selectivity. Based on extraction studies using clean water, 15% dichloromethane in hexane should be used as the solvent for extracting wastewaters. Acceptable recovery was obtained for phthalate esters when the background of electron capture sensitive materials was low. When interferences were present, clean-up procedures did not allow the phthalates to be quantitated in microgram/l concentrations. The recoveries that can be expected for the compounds studied ranged from 40 to 100%, depending upon the compound and the wastewater studied. Storage frequently resulted in significant losses of the study materials and in less precise determinations. (Moore-SRC)

5B. Sources Of Pollution

MANAGEMENT OF GROUND WATER CONTAMINATED BY AROMATIC HYDROCARBONS IN THE AQUIFER SUPPLYING AMES, IOWA,

Southern Illinois Univ. at Carbondale. Coal Extraction and Utilization Research Center.
H. Yazicigil, and L. V. A. Sendlein.
Ground Water, Vol 19, No 6, p 648-665, November/December, 1981. 12 Fig, 3 Tab, 34 Ref.

Descriptors: *Aromatic compounds, *Coal gasification, *Water pollution treatment, Path of pollutants, Water pollution sources, Hydrocarbons, Organic compounds, Ames, Iowa, Model studies, Water pollution control, Waste disposal, Chemical wastes, Industrial wastes, Waste dumps, *Groundwater pollution.

A digital model and field monitoring data were used to evaluate alternatives for handling a coal tar residues dump and the resulting pollution of the unconsolidated buried channel aquifer supplying Ames, Iowa. Wastes from a coal gasification plant were deposited in a pit from 1910 to the late 1920's. Several city wells were abandoned and some are presently threatened because of tastes and odors from the chemicals. A variety of hydrocarbons and other organic compounds, mostly aromatic, have been identified in contaminated well water: benzenes, indenes, naphthalenes, styrenes, indoles, and many others. Management practices considered were: (1) removal of the residue with maintenance of the present pumping practices, (2) construction

of a pump trough barrier and a protective pump well, (3) regulation of drawdown and recovery periods in municipal wells, (4) regulation of pumping in city wells, (5) expansion of the well field to the northeast, and (6) a new well field to the southeast. None of the alternatives, used alone, offered a practical solution to the problem. It was recommended that two localized coal tar residue sources be excavated and a pumping trough barrier with protective pumping well be constructed. If no remedial measures are taken, the well field must be expanded to the west or the water system connected with the Iowa State University well system. (Cassar-FRC)

IMPACT OF DREDGED MATERIAL DISPOSAL UPON GROUND-WATER QUALITY,

Calscience Research, Inc., Huntington Beach, CA.
R. D. Morrison, and K. Y. Yu.
Ground Water, Vol 19, No 3, p 265-270, May/June, 1981. 2 Fig, 2 Tab, 10 Ref.

Descriptors: *Water quality, *Dredging, *Land disposal, Fate of pollutants, Water pollution sources, *Leachates, Solute transport, Sodium, Chlorides, Potassium, Sediments, Dilution, Chelation, Chemical precipitation, Sulfides, Manganese, Iron, Alkalinity, Water hardness, *Groundwater pollution, Adsorption, Weathering, Chemical reactions, Trace metals.

Groundwater was monitored over a 2-yr period at three dredge disposal sites: Grandhaven, Michigan (freshwater); Mobile, Alabama; and Sayreville, New Jersey (both estuarine). Leachate samples collected from monitoring wells and vacuum/pressure lysimeters were analyzed for 27 water quality parameters. Na, Cl, and K concentrations were high (maximum 4310, 8330, and 250 mg per liter, respectively) in groundwater sites where saline dredge material was deposited. Dilution is the major mechanism regulating transport of these ions. Mg and Ca maxima were 720 and 380 mg per liter, respectively, representing significant increases in water hardness over background levels. Mechanisms for transport of Mg and Ca are dilution, precipitation/dissolution, and ion exchange. Alkalinity ranged from undetectable to 1000 mg per liter and was controlled by dissolution of carbonates, weathering, and oxidation-reduction reactions. Total organic carbon was highly correlated with alkalinity. Maximum iron and manganese levels were 538 and 12 mg per liter, respectively, above the recommended EPA drinking water quality standards. Sulfides were generally below 20 mg/kg. Phosphate, Cd, Cu, Pb, Ni, Hg, and Zn occurred in concentrations too small to have significant effects on groundwater quality. Major controlling factors for these ions are complexation, adsorption, and precipitation/dissolution. (Cassar-FRC)

THE PREDICTION OF RAIN ACIDITY AND SO2 SCAVENGING IN EASTERN NORTH AMERICA,

Atmospheric Environment Service, Downsview (Ontario).
L. A. Barrie.
Atmospheric Environment, Vol 15, No 1, p 31-41, 1981. 9 Fig, 3 Tab, 19 Ref.

Descriptors: *Acid rain, North America, Rainfall, Model studies, Prediction, *Hydrogen ion concentration, *Sulfur compounds, Air pollution, Water pollution sources, Forecasting, Acidity, Projections, Sulfates, Aerosols, Path of pollutants.

The role of sulfur dioxide as a rainwater acidifying agent is examined. A quantitative relationship between the sulfur (IV) content of rain, rainwater pH and temperature is derived which can be used in long-range transport models to simulate the sulfate scavenging process mathematically. Methods of calculating precipitation acidity and thus sulfur dioxide washout are demonstrated for various rainwater chemistry data sets. Based on the equilibrium solution chemistry of sulfur dioxide, it is concluded that, for the purposes of long-range transport models, sulfur dioxide scavenging by rain can be calculated using a washout ratio approach, provided that the temperature and acidity of rain are taken into account. It is also concluded that dissolved sulfur dioxide can contribute a significant fraction of the total hydrogen ions deposited in rainfall, particularly at near zero degrees C, in air containing aerosols of low acidity such as ammonia neutralized sulfuric acid particles. If long term trends in the acidity of rain are to be explained, dissolved sulfur dioxide should be measured in precipitation. The sulfur dioxide scavenging process must also be realistically simulated in models. To accomplish this one must be able to predict precipitation acidity. The strong relation between the hydrogen ion and sulfate ion contents of rain in acid sensitive areas of eastern North America enables one to predict precipitation acidity from models of the sulfur cycle. Nitrogen oxides are also important, but their cycles are not so well known. More study is also needed in order to parameterize sulfate aerosol washout. (Baker-FRC)

FARM, URBAN DRAINAGE POLLUTING GREAT LAKES.

Water and Pollution Control, Vol 118, No 7, p 26, July, 1980.

Descriptors: *Lakes, *Nonpoint pollution sources, *Great Lakes, Farming, Urban runoff, Lead, Mercury, Phosphorus, Eutrophication, Algal growth, Drainage effects, Environmental effects, Urban drainage, Agricultural runoff, Industrial wastes.

A comprehensive study was conducted over 11 years of pollution problems in the Great Lakes area. A new approach was seen as needed for controlling land drainage non-point pollution. The approach recommended calls for closer coordination between and within the Governments of the two joining countries, Canada and the United States. Such cooperation is necessary to overcome gaps and inconsistencies in the several government programs that affect the actions of individual firms, urban dwellers, cottagers and farmers, all of whom contribute to this type of pollution. Considerable attention must be given to the local level implementation of the programs. Specific instances where regulation is needed include the disposal of hazardous industrial wastes, sediment control in urban areas, and the spreading of manure on frozen agricultural land during the winter. At present agricultural practices are responsible for the majority of phosphorus which finds its way into water bodies and causes excessive algal growth. Toxic and hazardous chemicals are also of great concern, and while some have been declining in their presence in water and fish, other problems are emerging. Lead, largely from vehicle exhausts carried through the air, is now found throughout the Great Lakes sediments and could present a problem similar to that of mercury contamination. Hazardous waste disposal must be more closely controlled. Conservation of resources and recycling of many products are urged. (Baker-FRC)

KINETICS OF MONOCHLORAMINE DECOMPOSITION IN THE PRESENCE OF BROMIDE,

North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
T. W. Trofe, G. W. Inman, Jr., and J. D. Johnson.
Environmental Science and Technology, Vol 14, No 5, p 544-549, May, 1980. 9 Fig, 3 Tab, 19 Ref.

Descriptors: *Chlorine, *Monochloramine, *Cooling water, Electric powerplants, Chemical reactions, Toxicity, *Bromides, Seawater, Estuarine environment, Kinetics, Organic compounds, Biocides, Water treatment, Fate of pollutants, *Cape Fear River estuary, North Carolina.

Monochloramine, a reaction product of chlorine and natural waters (especially estuarine and marine) found in cooling waters discharged from electric powerplants, is persistent and toxic to aquatic life. Decomposition in the presence of bromide, which occurs naturally in seawater, produced a previously unidentified product, NHBrCl. In artificial seawater, the reaction between monochloramine and bromide ion was first order with respect to monochloramine, bromide ion, and hydrogen ion concentration over the pH range 6.8-8.2. The overall empirical rate constant at 25C was evaluated as 2.8 times 10 to the 6th power M squared/sec. Bromide oxidation is the primary pathway for monochloramine removal in highly saline waters. This conclusion was confirmed by spiking a sample of unfiltered water from the Cape Fear River estuary with monochloramine and measuring the concentration by UV absorbance. The water salinity was 33.6 parts per thousand. The observed half-life of monochloramine, 3-4 hr. was in good agreement with the predicted half-life of 5 hr. Bromochloramine (NHBrCl) is expected to be less stable in aqueous solution than monochloramine. However, research is needed on NHBrCl toxicity to marine organisms. (Cassar-FRC)

SEEPAGE FROM FREE WATER ABOVE IMPERMEABLE TAILINGS,

Queensland Univ., Brisbane (Australia). Dept. of Civil Engineering.
L. T. Isaacs, and B. Hunt.
Journal of the Geotechnical Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No GT11, p 1563-1577, November, 1981. 8 Fig, 14 Ref.

Descriptors: *Seepage, *Mine wastes, *Mathematical models, Spoil banks, Dams, Stability analysis, Water pollution sources, Methematical studies.

A model is proposed for the entry region of the discharge from free water above impermeable tailings, and an analytical solution is presented. Seepage analysis was performed to estimate the amount of water leaving a tailing structure as seepage, to determine pore pressures for stability analysis, to estimate the exit point, and to estimate the seepage velocities. Experimental results indicated that the theory will yield reasonably accurate estimates of the discharge when field conditions are close to those assumed in the model. Results were compared to those of Thomson and Rodin and with the half triangular ditch solution. (Small-FRC)

FORMS OF HEAVY METALS IN THE SETTLING MATTER FROM A MAN MADE LAKE (IN JAPANESE),

Aichi Environmental Research Center, Nagoya (Japan).
H. Otsuka.
Japanese Journal of Limnology, Vol 42, No 1, p 28-39, 1981. 6 Fig, 8 Tab, 20 Ref.

Descriptors: *Heavy metals, *Sedimentation, *Fate of pollutants, *Organic matter, *Adsorption, Iron, Manganese, Copper, Nickel, Cadmium, Zinc, Metals, Metal complexes, Artificial lakes, Separation techniques, *Lakes, Suspended sediments, Suspended solids, Path of pollutants.

Heavy metal settling in a productive man-made lake was examined by selective extraction of water samples collected at various depths each month for an 18 month period. The largest amount of metals was extracted with hydrochloric acid. More than 80% of the Fe recovered was by extraction with hydrofluoric acid. A small amount of Cu was extracted with hydrogen peroxide. The quantities of metals extracted varied seasonally, with distinctive patterns among metals and fractions. The most important form of metals in lake water appeared as adsorbed or coprecipitated forms on organic matter or as hydrous Fe/Mn oxides. Significant amounts of Cu were bound to organic matter. Zn, Ni, and Cd were associated with Mn oxides and organic matter, while Cu was found frequently with Fe and Mn oxides. It was suggested that the sedimentation of metals within the lake was closely related to the cyclic patterns of Fe, Mn, and organic matter. (Geiger-FRC)

STUDIES ON THE ABILITY OF A POTAMOGETON PECTINATUS COMMUNITY TO REMOVE DISSOLVED NITROGEN AND PHOSPHORUS COMPOUNDS FROM LAKE WATER,

Rhodes Univ., Grahamstown (South Africa). Inst. for Freshwater Studies.
C. Howard-Williams.
Journal of Applied Ecology, Vol 18, No 2, p 619-637, August, 1981. 5 Fig, 9 Tab, 41 Ref.

Descriptors: *Aquatic plants, *Algae, *Nutrient removal, Fate of pollutants, Wastewater treatment, Macrophytes, Potamogeton, Nitrogen, Phosphorus, Submerged plants, Sediments, *Lakes, Lake Sediments, Chlorophyll a, Phytoplankton, Epiphytes.

Enclosures containing dense growths of Potamogeton pectinatus were enriched weekly for 15-23 weeks with the following amounts of P and N (in mg per cu meter), respectively: low, 5 and 50; medium, 10 and 100; high, 25 and 250; and extra high, 100 and 1000. Chlorophyll a levels remained low in all treatments, but filamentous epiphytic algae (predominantly Cladophora sp.) developed in proportion to the degree of enrichment. After 9 weeks nutrients added at all levels were utilized within 1 day. Potamogeton plants were not adversely affected by these dense algal mats. P32 tracer experiments showed that most of added P was absorbed within 2 hours by the filamentous algae. N and P levels were increased in algae by the extra high treatment only. Enrichment resulted in increased N concentrations in leaf, stem, root, and rhizome of Potamogeton at high and extra high treatment levels; increased P absorption was seen only in the extra high treatment. Organic matter, N, and P were significantly higher in the top 1 cm of sediments with the extra high treatment only. Beds of dense submerged macrophytes with associated algae may be useful as nutrient filters at fairly low P loads (100 micrograms per liter per week soluble P) in large water bodies, for example, septic tank flows or agricultural runoffs which drain into lakes or rivers. HYDROCHEMICAL CHARACTERISTICS OF THE STREAM DRWINKA AND ESTIMATE OF ITS SELF-PURIFICATION ABILITY,

Jagellonian Univ., Krakow (Poland). Dept. of Hydrobiology.
K. Jop.
Acta Hydrobiologica, Vol 22, No 3, p 249-262, 1980. 4 Fig, 5 Tab, 16 Ref.

Descriptors: *Rivers, *Chemical properties, *Industrial wastes, *Poland, Municipal wastes, Water pollution sources, Self-purification, Aquatic plants, Biological oxidation, *Fate of pollutants.

The hydrochemical character of the stream Drwinka, the degree of its pollution, and the process of its self-purification were examined. The Drwinka basin lies in the River Vistula's dead channel. A distinct depression of the terrain is noted along the course of the Drwinka, parallel to the Vistula. This depression is lined with a layer of sandy-gravelly quaternary sediment covered with silts and with formations of marshy accumulation. The ground water is very rich owing to the great thickness of quaternary alluvial sediments. The present bed of the Drwinka and its tributaries are modified by trimming and by land reclamation of the neighboring areas. The chief and constant sources of pollution are municipal sewage and wastes from a poultry farm at Niepolomice. Both are fed directly to the stream through five collectors located in Niepolomice. Pollution also arrives here from the Lenin Steel Works. The self-purification for this river occurs mainly in a 5 kilometer sector below Niepolomice. In the first 5 kilometers below the inflow of wastes the biochemical oxidation or organic matter occurred. For the next section of the river vascular plants played a marked role by assimilating great amounts of nutritive compounds. A 35% decrease in the mean concentration of most macroelements occurred in this area. Even with this cleaning process, the content of nutritive compounds in the water at the last measurement station was significantly higher than that occurring in natural waters. (Baker-FRC)

PLUTONIUM OCCURRENCE AND PHASE DISTRIBUTION IN SEDIMENTS OF THE WYRE ESTUARY, NORTHWEST ENGLAND,

International Lab. of Marine Radioactivity, Monte carlo (Monaco). Oceanographic Museum.
S. R. Aston, D. J. Assinder, D. A. Stanners, and J. E. Rae.
Marine Pollution Bulletin, Vol 12, No 9, p 308-314, September, 1981. 6 Fig, 2 Tab, 15 Ref.

Descriptors: *Plutonium, *Estuaries, *Path of pollutants, Fate of pollutants, Mercury, Sediments, *Wyre Estuary, Ravenglass Estuary, *England, Windscale, Nuclear fuel processing plants, Isotope studies, Organic matter, Particle size.

Distributions of plutonium isotopes were determined in Wyre Estuary, northwest England, about 60 km south of the Windscale nuclear fuel reprocessing plant. In surface samples Pu238 concentrations were 0.25-2.9 pCi per g and Pu239+240, 1.15-27.5 pCi per g. These levels are < 25% of typical values found in surface sediment samples at Ravenglass Estuary, 10 km south of Windscale. Ratios of Pu238:Pu239 were almost constant, 0.23, which indicates that Pu is deposited in surface sediments about 4 years after deposition at Ravenglass, or a total of 6-7 years after release in effluents and fallout at Windscale. Pu concentrations were correlated with total organic carbon, which may be a function of grain size. Leaching studies showed that only 20% of Pu was associated with Fe and Mn hydrous oxides, considerably less than in Ravenglass samples. This lends further support to the hypothesis that Pu is associated with organic matter (but not humic substances) in this site. Examination of 30 cm sediment cores showed that Pu239 levels were well correlated with Hg and total organic carbon throughout the core depth. (Cassar-FRC)

Descriptors: *Concretes, *Urban runoff, Storm runoff, Stormwater management, Heavy metals, Nitrogen, Nutrients, Phosphorus, Plant nutrients, *Water pollution control, *Comparison studies, *Pavement, Concrete pavement, Concrete grid pavement.

Problems of water quality and quantity have forced many communities to redefine the approaches to local stormwater management. New approaches-alternatives to the conventional means of piping a problem downstream--focus on maintaining predevelopment runoff levels by increasing opportunities for runoff infiltration, by controlling runoff velocities and volumes, and by reducing nonpoint pollutants. Concrete grid pavements have potential as a technology capable of performing these functions, but they have not yet been evaluated to the satisfaction of officials who must endorse or implement stormwater management strategies. This research measured, in a laboratory setting, runoff volume and pollutant load reductions associated with three types of grid pavements. A concrete slab was used as a control. Reductions in pollutant concentration and mass in water that percolated through the grids in the pavements were also measured. Runoff from the surface of the pavements and from water within the soils beneath the pavements was analyzed for phosphorus, nitrogen, organic carbon chromium, lead, and zinc. Results show that the grid pavements greatly reduced runoff volume, as compared to the concrete slab. The masses of 10 pollutants found in the runoff from this slab were much greater than those in the runoff from the grid pavements. The soils beneath the grid pavements acted effectively in removing significant quantities of pollutants from the water that infiltrated into them.

A REEXAMINATION OF THE ZOOPLANKTON COMMUNITY OF A DELAWARE TIDAL STREAM,

Delaware Univ., Newark. Coll. of Marine Studies.
M. P. Van House.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168501, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, August, 1981. 96 p, 7 Fig, 29 Tab, 94 Ref, Append. OWRT-A-044-DEL(2), 14-34-0001-9008.

Descriptors: *Zooplankton, *Tidal rivers, Estuaries, *Wastewater disposal, Water pollution sources, *Water pollution effects, Murderkill River, Broadkill River, *Delaware, Water quality.

The zooplankton community of the Murderkill River, a shallow estuary in southeastern Delaware, was studied in an earlier comparison of two rivers of differing water quality. At that time the Murderkill was an unperturbed system and the nearby Broadkill received considerable point source pollution. Since that time a regional wastewater treatment plant began operation, discharging its effluent through a tiny creek into the Murderkill, and several studies have documented water quality changes in the river. The present study is a qualitative and quantitative survey of the present zooplankton community in an attempt to detect changes that were predicted to accompany changes in water quality. Three indices of community analysis, percent similarity, rank correlation coefficient and diversity of change indicated that samples in the present study were similar to those collected before the treatment plant opened in relative abundance of dominants, rank and frequency of dominants and number and magnitude of

species changes. Analysis of individual groups of zooplankters such as rotifers, calanoid copepods, cyclopoid copepods and cladocerans revealed some shifts in species and relative abundances but the changes appeared to reflect differences in parameters such as a salinity rather than water quality. At present effluent levels, the zooplankton of the Murderkill River does not appear to have changed significantly following changes in water quality.

NUTRIENT LOADING - TROPHIC STATE RELATIONSHIPS IN FLORIDA LAKES,

Florida Univ., Gainesville. Water Resources Research Center.
L. A. Baker, P. L. Brezonik, and C. R. Kratzer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168568, Price codes: A07 in paper copy, A01 in microfiche. Publication No 56, 1981. 126 p, 43 Fig, 23 Tab, 88 Ref, 4 Append. OWRT-A-038-FLA(1), 14-34-0001-9010, 14-34-0001-0110.

Descriptors: Trophic state indicators, Watershed enrichment factors, *Nutrients, *Land use, *Trophic level, Nitrogen, Phosphorus, *Lakes, *Florida, Model studies, Nutrient loading.

Relationships among trophic state indicators and watershed enrichment factors were examined for 101 Florida lakes. Regression analysis was used to examine the relationship between land use and NPS nutrient loadings. The best model to predict NPS P loading included three land use variables while total drainage area alone was a good predictor of NPS N loading. Florida lakes were found to be shallow; few exhibit stable stratification or seasonal trends in chlorophyll a or nutrient concentrations. Many are N-limited; there is less chlorophyll a for a given level of P (even for P-limited lakes) than found in temperate lakes. The best predictions of N and P in Florida lakes are made using a modified Dillon-type model; the best predictions or chlorophyll a are made using Jones and Bachman-type model. The 1975 Vollenweider criteria and the Dillon criteria were modified to improve their predictive capabilities: in both cases the revisions resulted in higher critical loading rates. N loading criteria were developed; the best N loading criteria were based on a Dillon-type model. The correct response of a lake to alterations in nutrient loading will be obtained using the criteria (N or P) that predicts the lower trophic status. (Heaney-FLA)

PHYSICAL CHARACTERIZATION OF EXTRACHROMOSOMAL DNA IN CHESAPEAKE BAY BACTERIA FROM POLLUTED AND NON-POLLUTED SITES,

Maryland Univ., College Park. Water Resources Research Center.
D. L. Glassman, and L. A. McNicol.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168592, Price codes: A05 in paper copy, A01 in microfiche. Technical Report No 66, 1980. 78 p, 14 Fig, 15 Tab, 109 Ref, 4 Append. OWRT-A-050-MD(1), 14-34-0001-0122.

Descriptors: *Bacteria, *Ecosystems, *Chesapeake Bay, Estuarine environment, *Plasmids, Extrachromosomal DNA elements, Ecological effects.

The significance of extrachromosomal elements in natural populations of estuarine bacteria has not been determined. To obtain measure of the frequency of plasmids in this ecosystem, a random sample of the total aerobic heterotrophic community was collected from the Chesapeake Bay. Two hundred eighteen strains were examined by agarose gel electrophoresis, using an in-the-well lysis procedure. Forty four percent of these isolates carried at least one plasmic. This proportion did not vary significantly between three different sampling locations which span an enormous range of water quality. In general, organisms isolated from cleaner stations contained predominantly single, small plasmids with a molecular weight of three to five megadaltons. A significantly large percentage of bacteria isolated from Baltimore's inner harbor tended to carry multiple plasmids and plasmids greater than 30 x 10 degrees molecular weight. Plasmids were identified in organisms representing all the major taxonomic components of the estuarine aerobic heterotrophic community. Plasmids of the three to five megadalton size class were found to be extremely ubiquitous. DNA-DNA hydridization analysis between plasmid DNA from several isolates indicate that within a group of heterogeneous small cryptic plasmids may exist several groups of structurally related plasmids of both narrow and broad host range. Future work will be needed to further determine the extent of these homologies.

WATERSHED IMPACT ON STREAM WATER QUALITY: A TECHNIQUE FOR REGIONAL ASSESSMENT,

Wisconsin Univ., La Crosse. River Studies Center.
M. M. Smart, T. W. Barney, and J. R. Jones.
Journal of Soil and Water Conservation, Vol 36, No 5, p 297-300, September-October, 1981. 2 Fig, 3 Tab, 16 Ref. OWRT-A-111-MO(3).

Descriptors: *Water quality, *Land use, *Watersheds, Water pollution sources, Forests, Missouri, Urban areas, Farming, Chemical analysis, Streams, Ozarks, Baseline studies.

The use of general watershed data has been demonstrated in assessing the influence of watersheds on stream water chemistry. The Spring Creek watershed in Douglas County, Missouri, serves as an example of how such an assessment can be made. A total of 21 watersheds and streams were studied in an 11 county region of south central Missouri. Spring Creek is typical of watersheds in the Salem Plateau. There are no known point sources of chemicals. Land use consists of 86.3% forest, 13.6% pasture and 0.1% urban. Stream water samples were collected every 10 days from June 1978 to September 1979. Regression equations were developed to assess the relationships between the characteristics of the watershed. The areas of urban land and pasture on a watershed were associated with increased concentrations of most chemicals in streams. Inverse relations were noted between forest land use and the concentration of most chemicals in the streams. As the area of forest land on a watershed increased, stream chemical concentrations declined. Concentrations of chemicals and chlorophyll a in Spring Creek were generally low. Depending on the season, total phosphorus ranged from 7.6 to 19.9 milligrams per cubic meter. What effect land use changes in the Spring Creek watershed might have on water chemistry and algal biomass can be assessed using the empirical regression equations developed from the watershed-stream data base for late summer. Streams draining forest areas unaffected by human activity likely represent the background level of stream chemical concentrations in the Missouri Ozarks. (Baker-FRC)

KINETICS OF TRACE METAL PARTITIONING IN MODEL ANOXIC MARINE SEDIMENTS,

Oregon State Univ., Corvallis. Dept. of Civil Engineering.
S. M. Oakley, C. E. Delphey, K. J. Williamson, and P. O. Nelson.
Water Research, Vol 14, No 8, p 1067-1072, August, 1980. 6 Fig, 2 Tab, 12 Ref. OWRT-A-044-ORE(2), 14-34-0001-9039.

Descriptors: *Marine sediments, *Trace metals, *Anaerobic conditions, *Estuaries, *Kinetics, Sediments, Interstitial water, Geochemistry, Seawater, Salt water, Brackish water, Saline water, Spectrophotometry, Solubility, Leaching, Equilibrium, Copper, Cadmium, Lead, Zinc, Heavy metals.

A model anaerobic sediment consisting of humic acid, clay, ferrous, sulfide, sand, and seawater was utilized to study the partitioning of copper, cadmium, lead, and zinc between different geochemical phases. An extraction scheme was developed that was selective for each phase. The scheme involved separating the humic material and treating the remaining clays with nitric acid to strip the metals and to disolve the ferrous sulfide. Centrifuging then isolates the solid fraction, which contains trace metals associated with the ferrous sulfide. Metals dosed on sediment phases were extracted and analyzed using spectrophotometry. Results indicate that the kinetics of partitioning were rapid, regardless of which phase was dosed. Equilibrium was reached within two to five days. The final metal distributions show that adsorbing surfaces can significantly increase the quantities of metals that exist outside the sulfide phase. Thus, the metal sulfide phase may not be the dominant sink for trace metals in anaerobic sediments. (Titus-FRC)

EFFECTS OF RECREATION ON WATER QUALITY IN GUADALUPE MOUNTAINS NATIONAL PARK,

Texas Tech Univ., Lubbock. Dept. of Civil Engineering.
D. H. Dasher, L. V. Urban, M. J. Dvoracek, and E. B. Fish.
Transactions of the ASAE, Vol 24, No 5, p 1181-1187, September-October, 1981. 4 Fig, 36 Ref. OWRT-B-206-TEX(3).

Descriptors: *Water pollution sources, *Recreation facilities, McKittrick Canyon, Streams, *Texas, *Guadalupe Mountains National Park, Water quality, Sediments, Water analysis, Chemical composition, Leaves, Cesspools, Wastewater disposal.

Water quality was studied in the Guadalupe Mountains National Park, Texas. Livestock and wildlife have been the most frequent users of some areas. Guadalupe Spring was developed as a major source of water for both livestock and human needs of park service personnel living below Guadalupe Pass. In 1979 this spring flow was diverted to a natural water supply for wildlife following the development of a deep well at the park service housing site. Sewage effluents from both North and South McKittrick Canyons were disposed of in cesspools on alluvial terraces near the channel. Seventeen sampling sites were selected for periodic water quality analysis, including springs, surface water sampling stations and a well. All sampling was conducted during steady state base flow conditions. The chemistry of the waters reflected the sedimentary geology of the region. The water reflected a well buffered calcium carbonate-magnesium carbonate system. The principal ion was usually bicarbonate, while sulfate was the second most prevalent anion. These results accord well with water chemistry data from different areas of sedimentary deposits. Nutrient levels of nitrate-nitrogen and orthophosphate do not appear excessive considering the natural inputs, such as autumn leaf litter. Recreational use at present has not significantly affected or degraded water quality of the springs. There may have been some impact on quality in McKittrick Canyon stream. The actively used cesspool at the Pratt area may represent a present and certainly a future source of pollutants to this stream. (Baker-FRC)
W82-02821

NITROGEN RECYCLING IN A NORTH CAROLINA COASTAL RIVER,

North Carolina State Univ. at Raleigh. Dept. of Zoology.
D. W. Stanley, and J. E. Hobbie.
Limnology and Oceanography, Vol 26, No 1, p 30-42, January, 1981. 7 Fig, 2 Tab, 39 Ref. OWRT-B-077-NC(2).

Descriptors: *Nitrogen, *Coastal streams, *Water chemistry, Ammonium, Nirogen compounds, Dissolved solids, *North Carolina, Rivers, Particulate matter, Cycling nutrients, Path of pollutants, *Chowan River.

An experimental study of nitrogen cycling near the mouth of Chowan River, a Noth Carolina coastal river, was designed to investigate the validity of several assumptions frequently made about this process. The measured (bi-weekly) rates of ammonium assimilation by plankton were compared with

the rates of ammonium input (by runoff) into the system over a year. An estimation of the amount of nitrogen recycling was made from the differences between the assimilation rates and the rate of ammonium input into the system. High wintertime flow rates and concentrations of particulate and dissolved inorganic nitrogen resulted in much higher winter inflows, e.g., 1,127 tons of nitrogen in January, than summer inflows, e.g., 185 tons in August. Dissolved organic nitrogen comprised about 69 percent of the total annual nitrogen inflow, particulate nitrogen comprised 13 percent, and the remaining 18 percent was mostly ammonium. The lower section of the river is responsible for the breakdown of as much as 33 percent of the incoming dissolved organic nitrogen. Assimilation of ammonium by river plankton, computed by the short term uptake of tagged carbon and nitrogen, averaged about 100 grams of carbon per square meter per year and 32 grams of nitrogen per square meter per year. The seasonal patterns of inflow and uptake of dissolved inorganic nitrogen were completely out of phase. Over the period of the whole year, as much as 65 percent of the dissolved inorganic nitrogen assimilated by river plankton may have come from regeneration, mostly of ammonium, within the river. (Carroll-FRC)
W82-02822

MODEL OF TRACE-METAL PARTITIONING IN MARINE SEDIMENTS,

Oregon State Univ., Corvallis. Dept. of Civil Engineering.
S. M. Oakley, P. O. Nelson, and K. J. Williamson.
Environmental Science and Technology, Vol 15, No 4, p 474-480, April, 1981. 11 Fig, 2 Tab, 41 Ref. OWRT-A-044-ORE(3), 14-34-0001-9039.

Descriptors: *Trace elements, *Metals, *Sediments, Model studies, Adsorption, Sea water, Humic acids, Clays, Path of pollutants, Bentonite, Manganese oxides, Iron oxides, Copper, Cadmium, Trace metals.

An equilibrium adsorption model was developed to predict the partitioning of trace metals between different geochemical phases in aquatic sediments. The conditional equilibrium constants are determined from linear portions of adsorption isotherms. Partitioning of Cu and Cd was studied using bentonite clay, ferric hydroxide, manganese dioxide and humic acid in sea water, simulating a natural marine environment. Adsorption constants were much higher for Cu than for Cd for all the solid phases: Cu on bentonite clay, 43 liters per g; ferric hydroxide, 205; manganese dioxide, 7,339; and humic acid, 366. Constants for Cd were as follows (liters per g): bentonite clay, 1.1; ferric hydroxide, 4.4; manganese dioxide, 15.0; and humic acid, the lowest, 0.2. Since clay can account for up to 75% of many marine sediments; humic acid, 1.4-1.7%; and manganese dioxide, 0.003%, the model predicts that clay is the major sink for both Cu and Cd using the artificial geochemical phases described. Since the materials used in the laboratory studies were purified, results should not be extrapolated to the more complicated natural environment. (Cassar-FRC)

Descriptors: *Dissolved oxygen, *Water quality, *Estuaries, *Rivers, Water temperature, Salinity, Water pollution effects, *Maryland, *Rhode River Estuary, Chesapeake Bay, Diurnal variations.

Since April 1970 the U.S. Geological Survey has operated an estuarine water quality monitor in the upper reach of Rhode River, a small embayment on the northwestern shore of Chesapeake Bay. This report analyzes variations in diel oxygen over the period April 1970 through January 1979. The diel oxygen range is used as an indicator of open-water metabolism. Polygons of temperature versus salinity portray the monthly variations of the two dominant environmental factors which influence biological metabolism and reveal effects of events such as a cool versus a warm spring or salinity reduction due to tropical storm freshwater runoff. Seasonally the average daily oxygen pulse range increased from a winter low of 1.6 mg/L to summer high of 5.3 mg/L. Annually highest daily ranges occurred the summer of 1972 when nutrient laden runoff from tropical storm Agnes stimulated open-water metabolism to produce an average diel range of 6.3 mg/L. Spearman's ranked correlation coefficients were used to compare seasonal and annual variations in temperature and salinity versus diel oxygen range. There was high agreement between annual variations in spring temperatures and diel oxygen ranges and an inverse correlation between summer and autumn salinity and diel oxygen range. (USGS)

VINYL LINED ASBESTOS CEMENT PIPE PROBLEMS, OPERATOR ASPECTS,

Champlain Water District, South Burlington, VT.
R. L. Gardner.
Journal of the New England Water Works Association, Vol 95, No 3, p 220-223, 1981.

Descriptors: *Pipes, *Linings, Drinking water, Water pollution sources, *Carcinogens, *Asbestos, Chemical compounds, Decision making, Public relations, *Vermont, Public rights, Public policy, Public opinion, Trichloroethylene.

A potential problem of TCE (trichloroethylene) leaching out from vinyl linings of asbestos/cement pipes with its potential effect on human health was recognized in the Champlain Water District in April of 1980. A survey of the three water systems (South Burlington, Shelburne and Williston) was requested by the State Health Department of Vermont. Particular attention was to be given to pipe installed after 1974. TCE is listed as a suspected carcinogen; 40 ppb is the recommended maximum exposure over the long term. The maximum TCE level found in drinking water was 14 ppb. While the studies revealed that there was no cause for alarm over the drinking water in this area, the experience brought out two major points to be considered in dealing with a potential crisis in a department which involves public health. These two challenges are dealing with the water user's anxiety for his well being, and maintaining public confidence in the ability of the Department to handle the problem. Two essential means of maintaining control and accountability are described. The first is to call a staff meeting and inform the employees about the nature of the problem and the steps being taken to deal with it. The second item suggested is to remain available and communicative with the press. (Baker-FRC)

LEACHING OF A SORBED SOLUTE: A MODEL FOR PEAK CONCENTRATION DISPLACEMENT,

Griffith Univ., Nathan (Australia). School of Australian Environmental Studies.
P. W. A. Dayananda, F. P. W. Winteringham, C. W. Rose, and J. Y. Parlange.
Irrigation Science, Vol 1, No 3, p 169-175, 1980. 3 Fig, 1 Tab, 27 Ref.

Descriptors: *Leaching, *Irrigation effects, *Solute transport, *Fate of pollutants, Fertilizers, Soil profiles, Model studies, Raats model, Evapotranspiration, Rainfall infiltration, Infiltration, Absorption.

A simple model is developed for calculating the peak solute concentration depth in the case of a solute applied to the soil surface and subjected to alternating irrigation/rainfall and evaporation. This is compared with the Raats model (1975), which considers the distribution of salts in the root zone when irrigation and evapotranspiration rates are time invariant or change suddenly. Unlike the Raats model, the model presented here includes chemical and biochemical transformations, has no restrictions on evaporation or irrigation history, does not assume a constant water content, and is more readily applied to field situations. However, the Raats model can analyze the whole profile, whereas the present model is limited to predictions of peak movement. Field data on chloride and nitrate ion transport in Wisconsin (Saffigna et al., 1977) were compared with model predictions. The predicted and observed times for solute peak concentrations to reach the bottom of a 150 cm lysimeter after fertilizer application agreed well. (Cassar-FRC).

KD'S--CAN THEY BE USED TO DESCRIBE REVERSIBLE ION SORPTION REACTIONS IN CONTAMINANT MIGRATION,

Waterloo Univ. (Ontario). Dept. of Earth Sciences.
E. J. Reardon.
Ground Water, Vol 19, No 3, p 279-286, May/June, 1981. 7 Fig, 3 Tab, 10 Ref.

Descriptors: *Distribution coefficient, *Sorption, *Chemical reactions, Ion transport, Fate of pollutants, *Solute transport, Groundwater pollution, Leachates, Model studies, Equilibrium, Chemical precipitation, Radioactive waste disposal, Waste disposal, *Path of pollutants.

A constant charge model for reversible ionic sorption was used to demonstrate that distribution coefficients (Kd) of an ionic species vary in the case of contaminant migration in groundwater systems. In this dynamic situation the sorbed site populations at any point along the flow path are not in equilibrium with the way groundwater will evolve from mineral dissolution/precipitation, redox reactions, and prior sorption reactions during flow when it reaches this point. This work showed that Kd cannot be used to describe reactions in landfill leachate studies or deep well injections of liquid wastes where the chemistry of contaminated water is significantly different from the natural groundwater in the aquifer. It is doubtful that Kd's can be used to study trace element contamination in high level radioactive waste disposal studies because heating at the disposal site can change the chemical reaction rates. Descriptors: *Nonpoint pollution sources, *Water pollution sources, *Biochemical oxygen demand, *Urban runoff, *Dissolved oxygen, Nutrients, Sediments, Pesticides, Runoff, Fish, Oxygen demand.

A comprehensive survey and review of recent literature, especially EPA Research Reports, relating to nonpoint source (NPS) runoff from both urban and rural sources was carried out. Urban NPS runoff has been shown to contain large quantities of oxygen-demanding materials. Modeling studies have indicated that the dissolved oxygen (DO) demand from urban NPS runoff can result in low DO concentrations, either alone or in combination with point source discharges. The most serious rural NPS pollutants seem to be sediments from soil erosion, plant nutrients, and toxic materials such as pesticides. Continuous exposure to DO concentrations significantly lower than air saturation concentrations seems to be harmful to fish, both salmonids and warmwater species. Exposure to fluctuating DO concentrations between air saturation and 60-65% of saturation can reduce the growth rate of fish if the high and low concentration exposure periods are approximately equal (12 hours each) during each day. Efforts should be made to achieve the appropriate DO standards by reducing the loads of BOD in NPS runoff as well as point source discharges. Reduction of the BOD loadings from NPS runoff should result in other improvements in receiving water quality by reducing the loadings of suspended solids, plant nutrients, and potentially toxic materials. ORIGIN AND CHEMICAL COMPOSITION OF ANDROSCOGGIN RIVER FOAM,

Jordan (Edward C.) Co., Inc., Portland, ME.
B. K. Wallin, and B. T. Bisson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-208167. Price codes: A11 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-087, July, 1981. 5 p, 1 Tab.

Descriptors: *Foaming, *Surfactants, *Water pollution effects, *Effluents, Pulp and paper industry, Municipal wastewater, Resins, Fatty acids, Nonpoint pollution sources, Aromatic compounds, Foaming, *Androscoggin River, Maine.

For some time the rivers of northern New England have been known to be prone to foaming. In order for foam to occur, a critical concentration of a surface active substance must be present. A sampling and analysis program on the Androscoggin River and at International Paper Company's Androscoggin Mill in Jay, Maine investigated the origin and chemical composition of foam. Foaming has been an historical problem within pulp, paper, and paperboard mills, due to resin and fatty acids in mill effluent. Publicly owned treatment works and nonpoint sources may also be a source of surfactants. River foam downstream of Topsham was found to contain a plethora of organic matter, including neutrals, weak acids, polyaromatic pulping products, as well as inorganics. Foam upstream of all point sources lacked certain components, such as resin acids and chloroguaiacols, but was also found to be extremely complex. An attempt to mass balance a downstream sample of foam accounts for approximately 50% of both organic and inorganic matter. Municipal treatment plant effluents did not produce collectible quantities of foam when subjected to pneumatic treatment, but most of the pulp, paper, and paperboard mill treatment plant effluent samples did produce foam. Collectible foam was found to be enriched in methylene blue active substances, while polyaromatic pulping products were not concentrated in the foam. It could not be determined whether any of the industrial or municipal point sources acted alone, or in combination with one another and ambient conditions to cause the foaming conditions. (Moore-SRC)

FIELD INVESTIGATION OF CONTAMINANT LOSS FROM CHEMICALLY STABILIZED INDUSTRIAL SLUDGES.

Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-246332. Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-163, September, 1981. 6 p, 1 Fig, 2 Tab, 2 Ref. EPA-IAG-D4-0569.

Descriptors: *Groundwater pollution, *Leaching, *Sludge disposal, *Industrial wastes, Metal-finishing wastes, Soil contamination, Heavy metals.

In order to determine the effects of stabilized waste sludges on surrounding soils and groundwater, four sites where stabilized industrial wastes had been disposed were examined. All areas selected for study were in the humid eastern or southern United States where rainfall was sufficient to produce abundant leachate. The sludges had all been fixed using the same proprietary process involved addition of cementitious materials to form a stable, soil-like product. Two of the industrial waste sites contained auto assembly (metal finishing) wastes, one contained electroplating wastes, and the fourth contained refinery sludges. The physical properties of soils under the disposal sites were affected little, if at all, by the disposal operation. At one of the auto assembly waste disposal sites, high background levels of certain groundwater constituents masked any escape of pollutants from the fixed sludge. Elevated levels of chloride, calcium, and sodium were found in groundwater under and down gradient from the second auto assembly waste disposal site. Elevated levels of sulfate and boron were found under and down the groundwater gradient from the electroplating waste site. Elevated levels of sulfite, nitrite, cyanide, phenols, and arsenic were noted in groundwater under and down dip from the disposal area at the refinery site. High levels of soils collected beneath the stabilized wastes suggest that contaminants from the waste could be leaching into the groundwater. (Moore-SRC)

SOURCES OF HALOGENATED HYDROCARBONS IN AN URBAN WATER SUPPLY,

Municipal Environmental Research Lab., Cincinnati, OH.
W. C. Elbert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-208191, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-089, July, 1981. 3 p, 3 Tab. R804394.

Descriptors: *Halogenated pesticides, *Halogenated hydrocarbons, *Water pollution, *Drinking water, Chloroform, Effluents, Trihalomethanes, Polychlorinated biphenyls, Chlorination, Stream pollution, Water quality, Water treatment.

One of the major water quality problems is the presence of halogenated organics in water supplies, and the formation of certain halocarbons. The Passaic River in Little Falls, New Jersey, was selected for investigation of the sources and nature of such halocarbons in a highly urbanized watershed. The distribution and concentration of high-boiling and low-boiling halogenated hydrocarbons and halogenated pesticides were determined in the following surveys: general stream; sewage treatment plant effluent; industrial waste treatment plant effluent; and source, finished and delivered drinking water. During summer samplings, chloroform was the predominant purgeable halogenated hydrocarbon observed in the Passaic River and its tributaries. During colder months (all under ice cover), methylene chloride was the predominant halomethane. Dominant pesticides observed were alpha- and beta-BHC, and some polychlorinated biphenyls were frequently detected. Of the chlorophenols, trichlorophenol had the greatest distribution followed by 2,4-dichlorophenol, 2,6-dichlorophenol, tetrachlorophenol, and pentachlorophenol. Trihalomethane concentrations always increased in the water samples after chlorination, and trihalomethane formation potentials in stream samples ranged from 66 to 282 micro g/L total trihalomethanes. EFFECT OF N-BENZOQUINONE AND OF SOME POLYPHENOLS ON THE MEMBRANE POTENTIAL OF NITELLA SP. MEASURED BY THE OPEN-VACUOLE METHOD,

Irkutsk Univ. (USSR). Biological Research Inst.
M. N. Saksonov, M. S. Apartsin, M. P. Grudinin, and D. I. Stom.
Hydrobiological Journal, Vol 16, No 4, p 72-76, 1980. 3 Fig, 14 Ref.

Descriptors: *Water pollution effects, *Phenols, *Algae, Toxicity, Organic compounds, Membrane processes.

A study was made to compare changes in the membrane potential (MP) of cells of Nitella sp. at the time of cessation of the movement of the protoplasm under the influence of phenolic components of effluents differing in the mechanism of their toxic effect on cells. MP was measured without inserting the microelectrode into the cell by the open-vacuole method. The study revealed that the alteration of MP under the influence of n-benzoquinone, pyrocatechol and resorcinol by the time of cessation of cyclosis was negligible when compared with the initial potential, and that in guaiacol and 2,4-DNP the drop of MP was respectively 130 and 86 mV. On the basis of these findings, cessation of the motion of the protoplasm apparently occurs owing to structural disruption of the hydrophobic environment of the protein of the operator and repression of the latter due to changes in its conformation resulting from the alteration of protein-lipid bonds. Cessation of the motion of the protoplasm is a secondary reaction consequent upon damage to the plasmalemma. The more expressive nature of the MP is to be expected in this case. The cessation of cyclosis and the appreciable drop of MP justify the assumption that the effect of 2,4-DNP is also connected in the given case with a direct influence on the architectonics of the plasmalemma and thus on the state of the operators. The findings show fairly clearly that the reaction of MP and of the motion of the protoplasm to the compounds tested is closely connected with the way in which their toxic effect is exerted on the cells, and must be taken into consideration when devising biological tests. A CHIRONOMUS TENTANS BIOASSAY FOR TESTING SYNTHETIC FUEL PRODUCTS AND EFFLUENTS, WITH DATA ON ACRIDINE AND QUINOLINE,

Oak Ridge National Lab., TN. Environmental Sciences Div.
R. M. Cushman, and M. I. McKamey.
Bulletin of Environmental Contamination and Toxicology, Vol 26, No 5, p 601-605, May, 1981. 2 Tab, 18 Ref.

Descriptors: *Coal gasification, *Midges, *Toxicity, Water pollution effects, Testing procedures, Bioassay, Industrial wastewater, Acridine, Quinoline, Organic compounds, *Synthetic fuels.

As part of a program to evaluate the environmental effects of synthetic fuel products and effluents,

a series of tests is being used to measure the toxicity of these products and of representative pure compounds to aquatic organisms. A method for toxicity testing of synthetic fuel products and wastewater was developed for the midge, Chironomus tentans. Unlike previous C. tentans bioassays, this procedure excludes effects of organic substrates, feeding, aeration, and light. The midges were tested in glass beakers of filtered well water on a glass wool substrate. Calculated 48 hour LC50 values for typical synthetic fuel products were: acridine, 1.96 mg per liter, and quinoline, 57.2 mg per liter. (Cassar-FRC)

TOXICITY OF ENVIRONMENTAL ACID TO THE RAINBOW TROUT: INTERACTIONS OF WATER HARDNESS, ACID TYPE, AND EXERCISE,

McMaster Univ., Hamilton (Ontario). Dept. of Biology.
M. S. Graham, and C. M. Wood.
Canadian Journal of Zoology, Vol 59, No 8, p 1518-1526, August, 1981. 4 Fig, 1 Tab, 47 Ref.

Descriptors: *Water hardness, *Acidic water, *Fish, Water pollution effects, Toxicity, Acid rain, Hydrogen ion concentration, Sulfuric acid, Hydrochloric acid, Trout, Fish behavior.

The effects of water hardness (14 or 140 mg per liter CaCO3), acid type (HCl vs. H2SO4), and activity level (rest vs. exercise) on acid toxicity to rainbow trout fingerlings were studied at 15C in 7-day exposures. The 7-day LC50 pH levels were 4.1-4.5. H2SO4 was less toxic in hard water than in soft water at all pH levels during rest and exercise. Hard water decreased toxicity of HCl at pH less than 3.5 and increased toxicity at pH above 3.8. H2SO4 was less toxic than HCl in hard and soft weters except for soft waters above pH 3.8. Exercise increased H2SO4 toxicity in both hard and soft waters except in soft water at pH < 3.3. Critical swimming speeds were not significantly different between hard and soft water at the same pH in the ranges of 3.5-4.2 and neutral. However, below pH 4.6 in soft water and 4.4 in hard water, critical swimming speeds decreased 4% per 0.1 pH units. Any extrapolation from laboratory toxicity data to field survival criteria should consider the interactions described above. (Cassar-FRC)

EFFECTS OF FINE SEDIMENTS ON GROWTH OF JUVENILE COHO SALMON IN LABORATORY STREAMS,

Corvallis Environmental Research Lab., OR.
M. R. Crouse, C. A. Callahan, K. W. Malueg, and S. E. Dominguez.
Transactions of the American Fisheries Society, Vol 110, No 2, p 281-286, 1981. 5 Fig, 2 Tab, 13 Ref.

Descriptors: *Salmon, *Sediment concentration, Streams, Spawning, Aquatic productivity, Sedimentation, Sediment load, Fish eggs, Particle size, Habitats, Aquatic habitats, Substrates, Stream erosion, Stream degradation, Water pollution effects, *Fish physiology, Fish growth.

Previous studies have shown that sedimentation can affect salmon and trout streams by decreasing embryo survival and by reducing food organisms and habitat for juvenile and adult fish. Production by juvenile coho salmon (Oncorhyncus kisutch) was studies in 12 laboratory streams under six levels of fine sedimentation. Fish production was measured as a product of the mean number of fish in the channel and the difference in their mean initial and mean terminal weights. The production of juvenile coho salmon for each growth period was inversely related to quantities of fine sediment. Since increasing the sedimentation suppressed fish production, it was recommended that the habitats of salmonid juveniles as well as spawning areas should be protected against fine sediments. A visual technique for evaluating stream substrate quality, the Substrate Score, correlated closely with both the geometric mean particle size of the substrate and fish production. This method may also be used in field studies. (Geiger-FRC)

DECOMPOSITION AND MICROBIAL COLONIZATION OF LEAVES IN A STREAM MODIFIED BY COAL ASH EFFLUENT,

Wisconsin Univ.-Madison. Lab. of Limnology.
A. M. Forbes, and J. J. Magnuson.
Hydrobiologia, Vol 76, No 3, p 263-267, 1980. 3 Fig, 17 Ref.

Descriptors: *Macroinvertebrates, *Leaves, *Decomposition, Coal ash, *Water pollution effects, Invertebrates, Streams, Biodegradation, Degradation, Microbial degradation, Organic matter, Fungi, Aquatic fungi, Aquatic habitats, Food habits.

Leaves of sugar maple (Acer saccharinum) were submerged in a stream contaminated with coal ash effluent and in a reference stream on December 5, 1977. After 96 days immersion the ash-exposed leaves showed little decomposition beyond leaching of soluble organic material. Leaf surface area was almost unchanged, at about 55 sq cm per leaf (control 40 sq cm per leaf); ash free dry weight of a 15 mm disc was 4 mg per disc (control, 3 mg per disc); and ATP content was almost unchanged at about 50 nmol per g (control quadrupled from 100 nmol per g at 27 days to 400 at 96 days). No macroinvertebrates were found in the ash pit drain leaves, but 150 individuals per leaf pack from 19 taxa (predominantly grazers) were present in the control. Ash-exposed leaves were stiff and yellow-brown; control leaves were very thin and dark brown. The effluent stream was 2.7 + over - 1.9C warmer than the control stream and was higher in conductivity and lower in pH. Apparently the ash effluent indirectly reduced the quality of the environment for aquatic macroinvertebrates by inhibiting microbial growth on the leaves. (Cassar-FRC)

AGGREGATION OF SPOTTAIL SHINERS IN THE HEATED DISCHARGE OF A NUCLEAR POWER STATION,

National Marine Fisheries Service, Miami, FL.
E. D. Prince, and L. J. Mengel.
Transactions of the American Fisheries Society, Vol 110, No 2, p 221-225, March, 1981. 2 Fig, 1 Tab, 22 Ref.

Descriptors: *Water pollution effects, *Shiner, *Fish populations, *Nuclear powerplants, *Thermal pollution, Reservoirs, Ecological effects, Population dynamics, Aquatic populations, Population density, Distribution, Thermal water, Heated water, Powerplants, Electric powerplants, Keowee Reservoir, South Carolina.

Fish populations from five shoreline sites of Keowee Reservoir, South Carolina were sampled by bag seine for five consecutive summers from 1973 to 1978 to assess the impact of the Oconee Nuclear electric powerplant on fish distribution and abundance. Spottail shiners (Notropis hudsonius) were significantly more abundant in the waters affected by the heated discharge of the nuclear powerplant than in the other four areas. N. hudsonius first appeared near the nuclear station in 1975, and by 1977 was the most abundant species in this section of the reservoir. Spottail shiners increased annually during the study period in other areas of the reservoir, but their abundance decreased as distance from the powerplant increased. Increases in temperature and macrophyte populations were associated with increased numbers of spottail shiners and were considered to be regulating factors in the population dynamics of this species in Keowee Reservoir. DETOXIFICATION OF CHLORINATED SEWAGE EFFLUENT BY DECHLORINATION IN ESTUARINE WATERS,

William and Mary Coll., Gloucester Point, VA. Inst. of Marine Science.
M. H. Roberts, Jr.
Estuaries, Vol 3, No 3, p 184-191, September, 1980, 1 Fig, 3 Tab, 32 Ref.

Descriptors: *Wastewater treatment, *Dechlorination, Chlorination, *Estuarine environment, Water pollution sources, Chlorine, Toxicity, Detoxification, Decontamination, Secondary wastewater treatment, Advanced wastewater treatment, *Water pollution effects, Oysters, Shrimp, Fish, *James River, Virginia.

The dechlorination of chlorinated sewage effluent was studied to demonstrate that such a process would effectively eliminate toxicity attributable to the chlorine produced oxidants (CPO). The design of the study stipulated that the simulated effluent chlorine concentration should be the same as that in an actual plant effluent, 2 mg/l, as occurs at the James River Sewage Treatment Plant. A portion of the chlorinated sewage effluent was dechlorinated with sodium thiosulfate, and the dechlorinated waste was diluted with estuarine water in the same proportions as the clorinated waste. Menidia menidia, Palaemonetes pugio, and Crassostrea virginica were exposed to both the chlorinated and dechlorinated wastewater. Mortalities were noted in M. menidia and P. pugio due to high concentrations of chlorinated effluent, whereas similar concentrations of dechlorinated wastes did not cause mortalities. Mortalities in the chlorinated waste were correlated with chlorine residuals. The chlorinated wastes depressed the shell deposition rate of C. virginica below 50% of controls at all doses. Dechlorinated waste allowed shell deposition greater than 50% of controls. The occurrence of some growth inhibition, however, was noted in C. virginica exposed to dechlorinated waste, which suggests the presence of toxic material other than chlorine in the waste. (Baker-FRC)

RESPONSE OF SUBTROPICAL PHYTOPLANKTON TO POWER PLANT ENTRAINMENT,

Oceanic Inst., Waimanalo, HI.
P. Bienfang, and W. Johnson.
Environmental Pollution Series A, Vol 22, No 3, p 165-178, July, 1980. 3 Fig, 4 Tab, 16 Ref.

Descriptors: *Phytoplankton, *Cooling water, *Thermal stress, *Powerplants, Kahe, *Hawaii, Chlorophyll a, Adenosine triphosphate, Water pollution effects, Thermal pollution, Seawater, Primary productivity, Productivity, Entrainment, Photosynthesis, Biomass, Seasonal variation.

Phytoplankton entrained in the cooling waters of the Kahe, Hawaii, oil-fired power plant showed a temporary 30% decrease in primary productivity. Chlorophyll a and ATP levels were not significantly affected. Organisms were exposed to a 5-6 degrees C increase over the ambient 24-26 degrees C levels during the 4 min transit time. Rapid mixing returned the discharged water to ambient temperature within minutes. Sampling was done at different seasons during a 20-month period. Laboratory tests confirmed the field data and supported the conclusion that no seasonal variation was apparent. Thermal stress, rather than mechanical or pressure stress, was primarily responsible for the observed effects on the phytoplankton. (Cassar-FRC)
W82-02708

TOXICITY OF TEXTILE MILL EFFLUENTS TO FRESHWATER AND ESTUARINE ALGAE, CRUSTACEANS AND FISHES,

Environmental Protection Agency, Gulf Breeze, FL.
G. E. Walsh, L. H. Bahner, and W. B. Horning.
Environmental Pollution (Series A), Vol 21, No 3, p 169-179, March, 1980. 1 Fig, 5 Tab, 8 Ref.

Descriptors: *Textile mill wastes, *Algae, *Crustaceans, *Fish, *Toxicity, Water pollution effects, Effluents, Shrimp, Daphnia, Aquatic life, Invertebrates, Estuarine environment, Shrimp organic compounds, Heavy metals, Metals, Nutrients, Industrial wastes.

Algae and aquatic animals were exposed in the laboratory to secondary effluents from 23 textile

mills. There were wide variations in chemical compositions, but all contained heavy metals, organic chemicals, and nutrients. Algae, particularly Selenastrum capricornutum (freshwater) and Selenastrum costatum (estuarine), were most responsive to all wastes; some effluents were stimulatory at concentrations of less than 1% but inhibitory at concentrations greater than 50%. Overall, 61% of the effluents were toxic to Daphnia pulex, 40% to fathead minnows (Pimephales promelas), and 53% to grass shrimp (Palaemonetes pugio) and sheepshead minnows (Cyprinodon variegatus). There was no obvious relationship between biological effects and the many parameters of effluent quality. Both growth stimulants and toxicants were present in some wastes. The impact of complex wastes on aquatic systems was calculated using the discharge rate and the LC50, EC50, or SC20. Thus Waste X with low SC20 and high discharge rate was judged most toxic of the group. Waste W, with a low SC20 and low discharge rate, had a low potential for adverse effects. (Cassar-FRC)
W82-02710

ALUMINUM TOXICITY TO FISH AS RELATED TO ACID PRECIPITATION AND ADIRONDACK SURFACE WATER QUALITY,

Cornell University, Ithaca, NY.
J. P. Baker.
PhD Thesis, January, 1981. 458 p, 55 Fig, 40 tab, 152 Ref, 2 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-10995.

Descriptors: *Water pollution effects, *Acid rain, Acidity, Aluminum, Water quality, *Fish, Toxicity, Surface water, Seasonal variation, Hydrogen ion concentration, Lakes, Lake fisheries, New York, *Adirondack Mountains.

The Adirondack Region of New York State contains over 2000 lakes. Many of these lakes are experiencing acidification and declines or loss of fish populations. The objective of this investigation was to improve the understanding of effects of acidification of surface waters on Adirondack fish populations. It was found that on the average, aluminum complexed with organic ligand was the dominant aluminum form in the dilute acidified Adirondack surface waters studied. In laboratory bioassays, speciation of aluminum was shown to have a substantial effect on aluminum toxicity to early life history stages of fish. Based upon available field and laboratory data, concentrations of inorganic aluminum and hydrogen ions appear to be important factors determining fish survival in Adirondack surface waters affected by acidification. For the range of pH and aluminum levels, and fish species and life history stages studied, sensitivity to low pH levels decreased with increasing age while sensitivity to elevated inorganic aluminum levels increased with increasing age (through the post-swim-up fry stage). Water quality in Adirondack lakes and streams sampled was temporally highly variable. In general, in streams affected by acidification pH level was at a minimum (and conversely inorganic aluminum level at a maximum) during early phases of snowmelt in the spring and also during long periods of heavy rainfall, often concentrated in the fall season. Temporal water quality fluctuations in lakes were dampened by the larger water volume and longer water retention times within the system. (Sinha-OEIS)
W82-02726

EFFECTS OF HYDROLOGICAL AND BIOLOGICAL VARIABLES ON THE SURVIVAL, GROWTH, AND FOOD UTILIZATION OF ESTUARINE FISHES CAGE-CULTURED IN A HEATED WATER SYSTEM,

Texas A and M University, College Station.
F. V. Jones.
PhD Dissertation, May, 1981. 328 p, 47 Fig, 2 Tab, 154 Ref, 10 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-18271.

Descriptors: *Aquaculture, *Estuarine fisheries, *Heated water, Powerplants, Cooling water, Cooling ponds, Fish, Growth, Survival, Salinity, Temperature effects, Texas.

Estuarine fishes were cultured in cages in the intake area and at four locations in the cooling lake of a power plant near Baytown, Texas from 1 September 1976 through 1 September 1978 to determine the effects of heated water on the dynamics of growth. Evaluation of data was based on eight hydrological variables, survival, growth and food-conversion efficiency of pinfish (Lagodon rhomboides), spot (Leiostomus xanthurus), Atlantic croaker (Micropogonias undulatus), black drum (Pogonias cromis) and striped mullet (Mugil cephalus). Survival of fishes was low in the intake area and increased progressively through the cooling lake. Mortality was related to temperature, handling stress (especially in small fish) and rapid drops in salinity. The most important relationship relating to mortality was the temperature-salinity-size interaction. During winter periods of low temperature when salinity dropped rapidly, mortality rates were greatest; small fish were better able to tolerate stressful conditions than large fish. Percent growth was highest during warm months when fish were small and lowest in the winter. Instantaneous growth rates were correlated to temperature, salinity, feeding rate, size of fish and, to a lesser extent, station location, DO and pH. Mean food conversion efficiently (FCE) was highest when temperatures were high and fish small. (Sinha-OEIS)
W82-02730

THE EFFECTS OF URBANIZATION ON SMALL WATERSHEDS AND GROUNDWATER,

Rochester Univ., NY. Dept. of Geological Sciences.
R. L. Davis.
PhD Dissertation, 1980. 377 p, 80 Fig, 36 Tab, 77 Ref, 5 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-13608.

Descriptors: *Water quality, *Water pollution effects, *Groundwater, *Urbanization, Watersheds, Urban runoff, Flooding, Erosion, Environmental effects, Chlorides, *Penfield, New York.

A study was undertaken in Penfield, New York, to examine the effects that development was having on the small streams and ground water in the town. The ground water quality data collected from Penfield was analyzed by comparing it to data from the 1930's (when the town was not developed), by comparing groups of wells in rural and urban parts of the town, and by comparing wells grouped by their distance to the nearest road. The surface water data was analyzed by grouping watersheds as to their degree of urbanization. In addition seasonal changes in water quality were examined, as were effects of rainfall and snow fall on surface water quality. Substantially elevated levels of chloride ion concentrations were found in both the surface and ground waters of the town. In the surface waters, the increases in concentration were largest in the most urbanized watersheds, however, all watersheds appear to have been affected. In the ground waters the increases were greatest in ground water samples taken at locations close to roads. The implications suggested by the results of the study included the likelihood of a substantial decrease in quality of the town of Webster's water supply, and by extension, decreased water quality for the entire aquifer that supplies it. In addition, deterioration of surface water quality in Penfield and the other towns with streams tributary to Irondequoit Bay is likely to cause continued deterioration of the Bay environment. Strategies for minimizing the changes accompanying development included the use of less de-icing salt and the use of zoning to channel development into those areas whose development would cause the least damage. THE RESPONSE OF THE INVERTEBRATE FAUNA TO ORGANIC POLLUTION IN A WELL OXYGENATED KARST STREAM EXEMPLIFIED BY THE PRADNIK STREAM (SOUTH POLAND),

Polish Academy of Sciences, Krakow. Zaklad Ochrony Przyrody.
E. Dratnal, and K. Kasprzak.
Acta Hydrobiologica, Vol 22, No 3, p 263-278, 1980. 9 Fig, 2 Tab, 6 Ref.

Descriptors: *Karst hydrology, *Organic wastes, *Poland, Decomposing organic matter, Organic carbon, Waste load, Oxygen, Dissolved oxygen, Sedimentation, Sediments, Rivers, Bed load, *Benthic fauna, *Water pollution effects.

Results of three studies made on the benthic invertebrate communities of the Pradnik stream affected by waste waters from a dairy are presented. The three studies were conducted in 1968, 1969 and 1973-74. Samples were taken from the stream above the influx of wastes and below it as well, from the whole stretch of the stream affected by pollution. During 1969 a new waste water treatment plant in the vicinity broke down several times and the effectiveness of effluents disposal was not sufficient. In spite of some common features in the reaction of animals to organic pollution, marked differences also were in that reaction in the particular periods connected mainly with the varying efficiency of the waste treatment plant. Two zones emerged within the polluted section of the stream. The first zone was situated immediately below the influx of organic wastes. This zone was a zone of sedimentation and initial decomposition of organic matter. The bottom resembled a silty habitat, while the decomposition of the organic part caused a decline in oxygen content in the upper layer and its disappearance in the deeper silt layer. The second zone seemed to be a zone of total decomposition of organic matter and drawing of nutrients released into the process of primary production, expressed by the regulation of oxygen conditions and a high primary production yielding intense growth of algae covering stream-bed zones. (Baker-FRC)

STUDIES ON THE PRIMARY PRODUCTION OF THE RIVER SHATT AL-ARAB AT BASRAH, IRAQ,

Universidad de Oriente, Cumana (Venezuela). Inst. of Oceanography.
M. F. Huq, H. A. Al-Saad, and H. A. Hameed.
Hydrobiologia, Vol 77, No 1, p 25-29, 1981. 3 Fig, 2 Tab, 27 Ref.

Descriptors: *Chlorophyll a, *Productivity, *Rivers, Water pollution effects, Shatt al-Arab River, Basrah, *Iraq, Primary productivity, Eutrophication, Wastewater pollution.

Primary production at three stations in the Shatt Al-Arab River near Basrah, Iraq, was investigated from September 1976 to August 1977. Chlorophyll a levels ranged from 0.52 to 3.25 mg per cu meter and peaked in late February and in September-October. The station upstream of the city had the lowest chlorophyll a values, and the mid-city station, the highest. Gross primary production varied from 6.03 to 37.02 mg C per cu meter per hour with a maximum in August and a minimum in winter at all stations. The mid-city station was most productive. Chlorophyll a concentrations and gross primary production were positively correlated. (Cassar-FRC)

Descriptors: *Snails, *Water pollution effects, *Heavy metals, Copper, Zinc, Chromium, Nickel, *Toxicity, Cadmium, Ponds, Lakes, *India.

The acute toxicity of salts of copper, zinc, chromium, cadmium and nickel to the freshwater pond snail V. bengalensis was investigated. Snails were collected from FatehSagar Lake, Udaipur, and exposed to the salts under laboratory conditions. The heavy metallic ions were ranked according to the results in 96 hr median lethal dose studies as fol-

lows from the most toxic to the least toxic: copper, zinc, chromium, cadmium, and nickel. The acute toxicity of zinc varied greatly with the changing water quality. The deposition of a white precipitate at the bottom along with an increase in pH was noted in the zinc solution after 24 hr of exposure. This has also been noted in similar studies by other researchers. The 96 hr median lethal values for the metallic ions were 0.088 for copper, 2.83 for zinc, 6.27 for chromium, 8.40 for cadmium, and 39.83 for nickel, in ppm. The cadmium solution also showed a white precipitate and a milky appearance. (Baker-FRC)

THE RELATION BETWEEN 'HYDRAULIC STRESS' AND MICRODISTRIBUTION OF BENTHIC MACROINVERTEBRATES IN A LOWLAND RUNNING WATER SYSTEM, THE SCHIERENSEEBROKS (NORTH GERMANY),

Karlsruhe Univ. (Germany, F.R.) Inst. fuer Zoologisches.
B. Statzner.
Archiv fur Hydrobiologie, Vol 91, No 2, p 192-218, May, 1981. 1 Fig, 5 Tab, 67 Ref.

Descriptors: *Population dynamics, *Running waters, Stress, *Benthos, *Macroinvertebrates, Gastropods, Insects, Crustaceans, Flow characteristics, Hydrodynamics, Flow pattern, *Germany.

During a field study on the production ecology of two lowland brooks in North Germany, the sizing of the specimens sampled indicated a relation between specific size distribution and some hydrodynamic factor. The field data collected was then reviewed in relation to hydrodynamic effects. The study was carried out in the Upper and Lower Schierenseebrook, which are situated between three eutrophic lakes near Kiel. Both brooks are relatively short, with lengths of about 400 and 800 meters respectively. During the sampling period from spring of 1974 through autumn of 1975, discharges reached a maximum in winter and minimum from June to October. The substratum was sampled to a depth of about 5 cm. Parallel to each benthic sample the current speed, water depth, and character of the substratum occurring immediately at the sampling place were noted. The study demonstrated that mean size and abundance of benthic macroinvertebrates may be related to both the index of hydraulic stress and the thickness of the laminar sublayer. While the latter parameter is expected to describe the character of the forces acting immediately above the bottom more realistically than the former, both can be regarded as indices for the specific hydraulic stress. The use of hydraulic stress is favored in studies on running waters. (Baker-FRC)

DISTRIBUTION OF CHROMOBACTERIA IN A LOWLAND RIVER,

Surrey Univ., Guildford (England). Dept. of Microbiology.
M. O. Moss, and C. Ryall.
Microbial Ecology, Vol 7, No 2, p 139-149, 1981. 4 Fig, 4 Tab, 19 Ref.

Descriptors: *Rivers, *Bacteria, Silt, Organic matter, Temperature effects, Rainfall, Turbidity, *Wey River, *England.

The numbers of purple pigmented bacteria in the River Wey were estimated by use of a selective medium. Chromobacteria were not isolated from the springs at the source of the river. However, they were found within a short distance, and their numbers generally increased over the first 30 km. While the counts were always on the low side, they generally increased over the winter as opposed to summer. Water temperature and turbidity measurements, along with rainfall, were recorded during the time of sampling. Much of the variability in the counts of chromobacteria was correlated with turbidity. A significant inverse correlation with temperature was noted after turbidity effects were allowed for. These two factors, temperature and turbidity, together accounted for 64.7% of the variation in counts. A significant correlation was also noted with rainfall during the previous four days. Together these three factors accounted for 67.2% of the variability in counts. Samples of silt, soil and storm overflow effluents were studied in an attempt to discover the source of chromobacteria. The soil or silt which contained substantial quantities of organic material also contained the higher values of chromobacteria. (Baker-FRC)

SEASONAL CHANGE IN CILIATE POPULATIONS IN THE BOTTOM SEDIMENT OF A POLLUTED RIVER,

Tokyo Metropolitan Univ. (Japan). Dept. of Biology.
S. Suehiro, and Y. Tezuka.
Japanese Journal of Limnology, Vol 42, No 1, p 1-7, January, 1981. 5 Fig, 1 Tab, 20 Ref.

Descriptors: *Seasonal variation, *Protozoa, *Sediments, Bacteria, Temperature effects, Light intensity, Bottom sediments, *Water pollution effects, Rivers, Municipal wastewater, *Tamagawa River, *Japan, Population dynamics.

Species composition and the number of individuals of each species of ciliates were investigated for two years in the bottom sediment of a river polluted with municipal sewage. Emphasis was placed on the seasonal change in ciliates, because the seasonal change in river environment was felt to facilitate the study of the relationship between the ciliate community and environmental factors. The study was conducted 2 km upstream from the Marukobaski Bridge of the Tamagawa River, in the southwest part of Tokyo Metropolitan Prefecture, which has been polluted with a large amount of municipal sewage. A similar pattern of the seasonal change in ciliate populations was noted for two years. In winter, Paramecium caudatum, P. trichium, Colpidium colpoda and Chilodonella cucullulus dominated. From summer to autumn Loxodes spp. and P. caudatum were predominant. Frontinia leucas also appeared in the summer. Stentor, Metopus es, Litonotus and Acineria did not change seasonally. A bacterial density of approximately 10 to the 8th power cells per ml was observed in the sediment; thus prey availability does not account for the observed fluctuations. Interspecific relations such as predation and competition may be important factors controlling the seasonal changes in ciliate populations. (Baker-FRC)

M. Moraitou-Apostolopoulou, and L. Ignatiades.
Hydrobiologia, Vol 75, No 3, p 259-266, 1980. 4 Fig, 4 Tab, 22 Ref.

Descriptors: *Plankton, *Population dynamics, *Eutrophication, Water pollution effects, Coastal waters, Phytoplankton, Zooplankton, Bays, *Aegean Sea.

Water samples were collected from sites in the Aegean Sea area at about 1 meter depth between 10 and 11 AM at two week intervals from July 1977 through June 1978. The seasonal variation of phytoplankton at a station, where the effects of eutrophication from sewage were minimal, was similar in periodicity to the corresponding cycle in lower Saronicos Gulf, with characteristic peaks in spring and autumn. At a second station, where sharp eutrophication conditions prevailed, the annual cycle showed some discrepancies in periodicity, having maximum growth in August. The species the first station diversity at this station was also depressed. The zooplankton annual cycle at the first station was characterized by a period of lower abundance in May-October, followed by an increase in population from November through April, with characteristic peaks in November and March. At the second station the zooplankton cycle showed remarkable changes in periodicity, since maximum abundance occurred in July-September, followed by consequent decreases and increases in the population size during the rest of the year. The quantitative relationship between the principal grazers in the zooplankton population and the phytoplankton dominant species upon which these copepods were believed to graze was tested, but the correlation coefficient was nonsignificant, indicating that the grazers did not feed exclusively on the dominant flagellate. MORPHOLOGICAL CHANGES IN TOXIC AND NON-TOXIC MICROCYSTIS ISOLATES AT DIFFERENT IRRADIANCE LEVELS,

Orange Free State Univ., Bloemfontein (South Africa). Dept. of Botany.
G. H. J. Kruger, J. N. Eloff, and J. A. Pretorius.
Journal of Phycology, Vol 17, No 1, p 52-56, March, 1981. 4 Fig, 2 Tab, 28 Ref.

Descriptors: *Algae, *Morphology, *Light intensity, Pollutant identification, Phytoplankton, Cyanophyta, Eutrophication, Plant morphology, Microsystis.

Light intensity (4.5-40.0 microEin per sq meter per sec) and culture age produced variations in cell size in 2 isolates of Microcystis aeruginosa, one nontoxic (probably forma flos-aquae) and one toxic (probably forma aeruginosa). Average cell volumes were 33-119 cu microns and 21-74 cu microns, respectively. The rate of cell volume increase in cu microns per day was expressed by 1.03 times light intensity minus 6.49. Highest maximum average cell volume was at 17 micro Ein per sq meter per sec, above which cell growth was disrupted. Cell diameters ranged widely, from 3.4 to

7.2 microns for the nontoxic isolate and 1.8 to 6.4 microns for the toxic isolate. These results show that cell size as a method of distinguishing between the 2 isolates is not reliable unless environmental conditions are carefully considered. (Cassar-FRC)

A CARLSON-TYPE TROPHIC STATE INDEX FOR NITROGEN IN FLORIDA LAKES,

California Univ., Los Angeles. Office of Environmental Science and Engineering.
C. R. Kratzer, and P. L. Brezonik.
Water Resources Bulletin, Vol 17, No 4, p 713-715, August, 1981. 1 Fig, 2 Tab, 5 Ref.

Descriptors: *Nitrogen, *Lakes, Trophic level, *Eutrophication, Water quality, Monitoring, Mathematical studies.

A trophic state index was developed based on total nitrogen concentration. Information for building the index was taken from a data base consisting of predominantly nitrogen limited Florida lakes studied in the National Eutrophication Survey. The new index was compared with Carlson's index of 1977, which was based on total phosphorus concentration, and the lesser of the two values for each lake was averaged with indices based on Secchi disk transparency and chlorophyll a concentration to assess the trophic state of the 40 Florida lakes mentioned in the National Eutrophication Survey. Trophic state is a multidimensional phenomenon, and it is agreed in general that no single trophic indicator adequately measures the underlying concept. Combining the major physical, chemical, and biological expressions of trophic state into a single index smooths out the variability associated with individual indicators and provides a reasonable composite measure of trophic conditions in a lake. THE RELATIVE CONTRIBUTIONS OF SULFURIC AND NITRIC ACIDS IN ACID RAIN TO THE ACIDIFICATION OF THE ECOSYSTEM. IMPLICATIONS FOR CONTROL STRATEGIES,

Domtar Ltd. Research Centre, Senneville (Ontario).
R. A. N. McLean.
Journal of the Air Pollution Control Association, Vol 31, No 11, p 1184-1187, November, 1981. 1 Tab, 34 Ref.

Descriptors: *Acid rain, *Sulfuric acid, *Nitric acid, Snowmelt, Thaw, Aquatic life, Sulfur dioxide, Water pollution sources.

It is proposed that the contributions of nitric acid and sulfuric acid in atmospheric deposition to the acidification of the terrestrial and aquatic escosystems are not equivalent and that, except possibly during the spring thaw, nitric acid contributes considerably less to the acidification of the ecosystem. A major part of the assessment of the impact of acid rain on aquatic and terrestrial ecosystems involves the examination, by means of ion budgets, of the fate of each of the ionic constituents in atmospheric deposition in soils, surface waters, and other places. It was concluded that much of the nitric acid in acid rain is decomposed in the soils and waterways, and in the process acid is consumed. Therefore, unlike sulfuric acid in acid rain, nitric acid is not a significant contributor to long term acidification of the environment. Even so, during the spring thaw, in areas which have been heavily impacted by acid rain for a number of years, nitric acid which has concentrated in the snow pack over the winter may cause ecological damage, especially to fish populations. Though there is little doubt that tighter control strategies are needed to diminish the effects of acid rain on remote ecosystems, the existing control strategies, which have put more emphasis on the control of emissions of sulfur oxides than nitrogen oxides, have a reasonable scientific basis given present limited knowledge of their effects on the ecosystem. THE EFFECT OF ALPHA-HYDROXYBENZYLMETHANESULFONATE ON PHOTOSYNTHESIS AND EXCRETION OF CHLORELLA AND NATURAL PHYTOPLANKTON IN A LAKE,

Tokyo Metropolitan Univ. (Japan). Dept. of Biology.
Y. Watanabe.
Archiv fur Hydrobiologie, Vol 91, No 2, p 219-230, May, 1981. 4 Fig, 3 Tab, 16 Ref.

Descriptors: *Aquatic life, *Water pollution effects, Aquatic plants, *Phytoplankton, Chlorella, Chlorophtya, Algae, Lakes, Organic compounds, Stratification, Oxidation, *Hydroxybenzylmethanesulfonate.

The effect of alpha-hydroxybenzylmethanesulfonate on the photosynthesis and excretion of cultured Chlorella ellipsoidea and the natural phytoplankton populations in a lake was investigated to further the understanding of the role of glycolate excretion by phytoplankton in the carbon cycle in an aquatic ecosystem. HBMS stimulated the glycolate excretion of Chlorella in culture under a wide range of temperatures and light intensities. Similar effects were ascertained for the phytoplankton of a stratified eutrophic lake, Lake Nakanuma, in various seasons and at different depths of the photic zone. HBMS did not enhance the excretion of high molecular weight substances. The dark fixation of carbon dioxide by both samples was inhibited by HBMS. Total photosynthesis by Chlorella was slightly enhanced by HBMS. For the phytoplankton samples, the effect of HBMS on total photosynthesis was indefinite. The variability of the effect was apparently influenced by the nutritional state of the phytoplankton cells. (Baker-FRC)

CHANGES IN FLORA DOWN A STREAM SHOWING A ZINC GRADIENT,

Durham Univ. (England). Dept. of Botany.
P. J. Say, and B. A. Whitton.
Hydrobiologia, Vol 76, No 3, p 255-262, 1980. 2 Fig, 4 Tab, 18 Ref.

Descriptors: *Zinc, *Mine wastes, *Algae, *Aquatic plants, *Water pollution effects, Water quality, Gillgill Burn, England, Heavy metals, Streams, Species distribution, Diatoms, Cyanophyta, Chlorophyta, Chrysophyta.

The effects of zinc from lead mines abandoned in 1921 on the flora and water chemistry of a small stream were studied. Samples from 30 reaches, each 10 m long, of Gillgill Burn and its four tributaries contained from 0.24 to 25.6 mg per liter Zn (means for any one reach). There was a negative correlation between the number of photosynthetic species in a reach and the logarithm of Zn concentration. A nonpolluted stream contained 61 species, 11 not seen in Zn-contaminated waters. The water with the highest Zn level (25.6 mg per liter) had 25 species. Up to 41 species were recorded in water containing low levels of Zn (1-2 mg per liter). The species composition changed with Zn levels. Some species were present only at higher levels of Zn (less than 3 mg per liter): Schizothrix delicatissima, Synechococcus sp., Eunotia tenella, Pinnularia borealis, and Euglena mutabilis. Others were not observed in polluted waters: Microspora amoena, Synedra ulna, and Tabellaria flocculosa. (Cassar-FRC)

GROWTH CHARACTERISTICS OF THE HETEROTROPHIC BACTERIAL POPULATION OF WATER AND BOTTOM SEDIMENTS IN TANKS UNDER DIFFERENT TROPHIC CONDITIONS,

Kalyani Univ. (India). Dept. of Zoology.
B. B. Jana, G. N. Patel, S. K. Roy, and U. K. De.
Hydrobiologia, Vol 75, No 3, p 231-239, 1980. 2 Fig, 5 Tab, 14 Ref.

Descriptors: *Population dynamics, *Bacteria, *Sediments, Bottom sediments, Nutrients, Trophic level, Eutrophication, Temperature effects, Fertilizers, Microbiological studies, Water pollution effects, Field tests.

The growth characteristics of the heterotrophic bacterial community of water and bottom sediments in field-study tanks were studied under the influence of various doses of inorganic and organic fertilizers. The study was carried out in six cemented tanks of three trophic types in duplicate for twice-normal, normal and zero concentrations of superphosphate, urea and cow manure. Surface water and mud samples were collected at intervals of four hours during a day, once after 7 days and once after 32 days of fertilizer application, in order to determine the generation time of heterotrophic bacteria. The results indicated that the application of single and double doses of fertilizers in these tanks caused distinct changes in the heterotrophic microbial population of water and bottom sediments in the early phase of treatment. Since the organic matter and inorganic nutrients in the double dose tanks had been utilized at a faster rate than the single dose treatment, the population decline was much higher in the former than in the latter treatment for the same passage of time. The population growth of bacteria of water in the tanks was inversely linked with the diurnal changes of water temperature recorded after 32 days of treatment and with dissolved oxygen level. No significant relationship between the heterotrophic bacterial population and the content of water was observed, but an inverse relationship between P and bacterial population in sediment was noted in the early phase of treatment. The growth curve of the heterotrophic bacterial population was independent of the physicochemical processes such as pH, carbonate, bicarbonate, nitrite nitrogen and specific conductivity. (Baker-FRC)

PREDATOR-PREY RELATIONSHIPS AMONG WATER-MITES (HYDRACARINA) AND OTHER FRESHWATER ORGANISMS,

Goeteborg Univ. (Sweden). Dept. of Zoology.
M. O. G. Eriksson, L. Henrikson, and H. G. Oscarson.
Archiv fur Hydrobiologie, Vol 88, No 2, p 146-154, March, 1980. 1 Fig, 2 Tab, 17 Ref.

Descriptors: *Ecological effects, *Fish, *Predation, *Population dynamics, *Mites, Aquatic insects, Perch, Oligotrophic lakes, Acidic water, Acidity, Animal populations, Aquatic animals, Water pollution effects, Food chains, Zooplankton, Lakes, Field tests, Parasites, Sweden.

Predator-prey relationships among perch, water-mites (Piona carnea L.) and other aquatic species were investigated in field and laboratory tests. Significant relationships were noted between occurrence of fish and water mites in 16 oligotrophic lakes of Southwest Sweden. In a field experiment that kept perch only on one side of a lake by a net barrier, significantly more water mites were observed in the section containing fish. Laboratory tests showed that mites were eaten by perch only when no other food was available. In lakes devoid of fish, predation from insects kept water-mite populations in check. Water-mite populations may benefit from the presence of fish because increased predation of insects by fish may remove many of the natural predators of water mites. Some other factors such as lake acidification and the presence of more suitable zooplankton prey for water-mites might also account for correlations between fish and mite populations of the same lake. REDUCTION OF TOXICITY TO AQUATIC ORGANISMS BY INDUSTRIAL WASTEWATER TREATMENT,

EG and G. Bionomics, Wareham, MA.
G. A. Cary, and M. E. Barrows.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-222366, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S3-81-043, August, 1981. 5 p, 1 Tab, 3 Ref.

Descriptors: *Toxicity, *Industrial wastewater, *Bioassay, *Effluent, Pesticide industry, Pulp and paper industry, Chemical industry, *Fathead minnows, Daphnia, Aquatic animals, Environmental effects, Wastewater treatment.

In order to biologically evaluate the effectiveness of industrial wastewater facilities in reducing effluent toxicity to aquatic organisms, 24-hour static acute bioassays with untreated influent and treated effluent were conducted using fathead minnows and water fleas. Of primary interest was an evaluation of the capacity of the wastewater treatment facilities of the pesticide industry for reducing toxicity. On-site 24-hour static acute toxicity tests were performed during 10 consecutive workdays at seven industrial sites. Five of the test sites are defined as pesticide manufacturers, while the remaining sites consisted of an organochemical manufacturer and a bleached-kraft papermill. The data from those studies indicate that the wastewater treatment plants provided an average efficiency of 98% in reducing the toxicity of untreated wastewaters. The results of 10 consecutive days of biological testing at each site indicate that the toxicity of the treated effluent samples remained relatively constant from day to day. The average number of lethal units present in the treated effluent, as determined from tests with fathead minnows, was 2.1 with a range of 0-6 lethal units. Water flea tests provide a mean of 6.5 lethal units with a range of 0-34. The toxicity of the untreated influent samples was extremely variable on a day to day basis. Neither species tested proved to be a more sensitive indicator of toxicity, though a larger data base is required to make a valid appraisal. (Moore-SRC)

ALTERATIONS IN THE FREQUENCY OF SISTER CHROMATID EXCHANGES IN FLATFISH FROM PUGET SOUND, WASHINGTON, FOLLOWING EXPERIMENTAL AND NATURAL EXPOSURE TO MUTAGENIC CHEMICALS,

Washington Univ., Seattle. Coll. of Fisheries.
P. T. Stromberg, M. L. Landolt, and R. M. Kocan.
National Oceanic and Atmospheric Administration Technical Memorandum OMPA-10, June, 1981. 50 p, 13 Fig, 8 Tab, 70 Ref.

Descriptors: *Water pollution effects, *Mutagens, *Toxicity, Bioindicators, Fish, Carcinogens, Estuarine environmental, Sublethal effects, Puget Sound, Washington.

Contamination of the aquatic environment by chemical pollutants has become a serious environmental problem which is heightened by the fact that a number of these contaminants have been demonstrated to be mutagenic or carcinogenic. One method that has been used recently to assess the effects of mutagenic chemicals on various organisms measures the rate of sister chromatid exchanges (SCE). The technique of SCE was applied to English sole collected from Puget Sound, Washington. SCE were observed 5.5 days after in vivo exposure to a thymidine analogue, bromodeoxyuridine (50 mg/g body wt) which allows for differentiation in the staining affinity of chromatids and visualization of exchanges between them. A baseline SCE rate of 2.6 exchanges per cell was determined. The sensitivity of this test was examined by subjecting the fish to benzo(a)pyrene (B(a)P). The SCE rates of cells from fish exposed to three concentrations (0.05, 1.5, and 5 micro g/g body wt) of intaperitoneally injected B(a)P were 2.99, 4.07, and 5.93 SCE/cell, respectively. The response was found to be dose-related and significantly higher than the baseline frequency. To test the efficacy of this technique as a useful tool in screening fish for evidence of exposure to mutagenic chemicals, the chromosomes of English sole from a polluted site (Duwamish River, Seattle) were examined and found to have a significantly higher SCE rate (3.25 per cell) than the baseline. RECREATIONAL WATER QUALITY AND HEALTH,

Illinois Univ. at the Medical Center, Chicago.
R. L. Northrop, G. R. Brenniman, S. H. Rosenberg, R. B. Byington, and C. S. Hesse.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-103599, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S1-81-059, September, 1981. 3 p.

Descriptors: *Public health, *Water quality, *Swimming, *Recreation, Water pollution effects, Microbiological studies, Bacteria, Coliforms, Sampling, Beaches, Water analysis.

The overall objective of this pilot study was to develop and evaluate methods to determine the effect of recreational water quality on the health of persons bathing in fresh waters. Two beaches in the Cleveland, Ohio metropolitan area on Lake Erie were chosen for study: Edgewater Beach, near two sources of pollution; and Headlands State Park Beach, with no known point sources of pollution. One hundred families from each beach were selected to participate in the study over three weekends in July 1977. Five water samples were collected in a systematic pattern at each beach at 0900, 1200 and 1500 hours on each test day. Each sample was analyzed for total coliforms, fecal coliforms, E. coli, fecal streptococci, Pseudomonas aeruginosa, total staphylococci, pH, chloride, BOD5, turbidity, specific conductivity, suspended solids, total solids, and temperature. Results indicate that it is possible to recruit and follow families via telephone interviews over a three-week period with low attrition rates. The demographic characteristics of bathers and nonbathers at the two study beaches were generally similar. Families at the beach with poor water quality had a slightly lower socioeconomic status than families at the beach having good water quality. The concentrations of the water variables were found to be significantly different depending on the time of day and day of weekend that they were collected. Quality of recreational water can be adequately monitored by sampling the water for microbiological variables at one central location in the bathing area instead of the five locations used in this study, as long as time of day and day of weekend are considered. 5D. Waste Treatment Processes

SPIRAL CLASSIFIERS HELP ONE MANUFACTURER MEET ENVIRONMENTAL STANDARDS MORE EASILY,

T. Bhagat.
Water and Pollution Control, Vol 118, No 7, p 15, 1980. 1 Fig.

Descriptors: *Industrial wastewater, *Wastewater treatment, Suspended solids, Abrasion, Solids, Settleable solids, Sedimentation, Separation techniques.

Wastewater from the General Motors facility at St. Catharines, Ontario, is treated by the plant's wastewater treatment facility, which handles more than 17,000,000 gallons a day, excluding sanitary waste. The solids content is high in grit and abrasive material, amounting to about 27% sand and iron filings. Severe wear and stoppages were occurring at the plant due to grit in the system. Several methods of cleaning the wastewater before it entered the two 130 ft diameter clarifiers were considered. The solution selected involved the installation of three 72 inch diameter spiral classifiers. The spiral classifier combines settling out of solids and physical removal of larger material. It builds a bed beneath its spiral conveyor so that coarser material and tramp items can be raked up and out the top. Pump and equipment maintenance problems have diminished with the use of spiral classifiers, as there are fewer solids to settle. GM is now meeting environmental standards more easily. Downtime at the company has been lessened. Plans are now being made to cover the classifiers with an insulated enlcosure and pass warm air (24 degrees C) over the surfaces to combat winter freeze-up possibilities. (Baker-FRC)

APPLICATION OF ADSORPTION TO WASTEWATER TREATMENT,

Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
W. J. Weber, Jr.
Industrial Water Engineering, Vol 18, No 4, p 19-25, July/August, 1981.

Descriptors: *Activated carbon, *Adsorption, *Organic compounds, Benzene, Carbon tetrachloride, Chlorinated hydrocarbons, *Wastewater treatment, Industrial wastewater, Model studies, Reviews.

The use of adsorption, specifically by activated carbon, for pretreatment of industrial wastes for priority pollutant removal is reviewed. Although activated carbon is an effective adsorbent for most of the 114 organic priority pollutants, the capacities and adsorption rates vary significantly among commercial carbons and among pollutants, and are affected by other substances and conditions. Therefore, it is impossible to generalize or extrapolate system design parameters; each situation requires a separate design. Tables list Freundlich adsorption isotherm parameters for selected pollutants and Freundlich isotherm constants for selected pollutants on four granular and four powdered commercial carbons. The Michigan Adsorption Design and Application Model (MADAM) is discussed and illustrated to show the application of modeling techniques to cost-effective and efficient adsorber design. The two representative cases in-

volve rate data in completely mixed batch reactors containing granular activated carbon for carbon tetrachloride and for benzene. (Cassar-FRC)

ESTIMATION OF PRIMARY PRODUCTIVITY FROM DIEL NITRATE UPTAKE MEASUREMENTS OF THE WATER HYACINTH EICHHORNIA CRASSIPES IN AN AQUACULTURE SYSTEM,

Harbor Branch Foundation, Inc., Fort Pierce, FL.
M. D. Hanisak.
Aquaculture, Vol 19, No 1, p 75-86, January, 1980. 1 Fig, 3 Tab, 19 Ref.

Descriptors: *Nitrates, *Aquaculture, Nitrogen, *Tertiary wastewater treatment, Water hyacinth, Macrophytes, Natural waters.

Eleven diel experiments were conducted from January to July 1978 for Eichhornia crassipes. The primary productivity of the water hyecinth was estimated from the nitrate-nitrogen uptake in an aquaculture system using a continuous, automated nutrient analyzer apparatus. Values determined by directly harvesting the biomass agreed with those obtained by this new method. The use of diel nutrient uptake measurements would be a significant improvement for the proper management of aquatic macrophytes in an aquaculture system where measurements based on harvesting methods would be impractical. There were few diel changes in nitrate-nitrogen uptake by Eichhornia, which is beneficial to this species not only in terms of its ecological success in the natural ecosystem, but also in its ability to remove nutrients from tertiary sewage treatment. However, the applicability of this technique for measuring the primary productivity of natural systems is not clear due to potential problems such as reduced ambient nutrient levels, lack of a steady state, not very homogeneous plant population, greater nutrient regeneration, and lack of clearly defined and measurable nutrient inputs and outputs of the system. However, the method would probably be appropriate in circumstances similar to those that permit the use of diurnal oxygen or 'upstream-downstream' methods of measuring productivity. (Baker-FRC)

REVERSE OSMOSIS SEPARATION OF SULFATE, NITRATE, AND AMMONIA FROM MINING EFFLUENTS,

Health and Welfare Canada, Ottawa (Ontario). Health Protection Branch.
M. Malaiyandi, and V. S. Sastri.
Separation Science and Technology, Vol 16, No 4, p 371-376, May, 1981. 3 Tab, 16 Ref.

Descriptors: *Reverse osmosis, *Membranes, *Mine wastes, Iron, Magnesium, Copper, Zinc, Calcium, Nitrates, Sulfates, Ammonia, Water treatment, *Wastewater treatment, Inorganic compounds, Ion exchange, Quirke Lake, Separation techniques, Cellulose acetate, Water reuse, *Demineralization.

Cellulose acetate membranes were used to study the reverse osmosis behavior of several inorganic ions commonly found in mining effluents. The membranes were first characterized with 1425 mg per liter NaCl solution. The percentage separation increased linearly from 100 to 300 psig and reached a maximum at about 300 psig. The maximum separations for several salts were: sodium sulfate, 1034 ppm, 94.1%; magnesium perchlorate, 830 ppm, 94.7%; magnesium chloride, 1010 ppm, 87.1%; magnesium sulfate, 1020 ppm, 88.2%; calcium chloride, 820 ppm, 89.5%; calcium nitrate, 910 ppm, 94.7% and ammonium nitrate, 3470 ppm, 55.0%. A sample of mining effluent from the Quirke Lake operation, subjected to reverse osmosis at 300 psig, reduced levels of Ca, Zn, Fe, Cu, Mg, nitrate, sulfate, and ammonia from 2.6 to 16 fold. Further second stage reverse osmosis treatment produced a water suitable for recycling purposes. (Cassar-FRC)

SEPARATION OF TOXIC ORGANOTIN COMPOUNDS FROM AQUEOUS SOLUTION BY ADSORPTION,

Kentucky Univ., Lexington. Dept. of Chemical Engineering.
D. Bhattacharyya, C. Adema, and D. Jackson.
Separation Science and Technology, Vol 16, No 5, p 495-503, 1981. 4 Fig, 3 Tab, 4 Ref.

Descriptors: *Wastewater treatment, *Organic compounds, *Activated carbon, Adsorbents, *Separation techniques, Organic pesticides, Fungicides, Tin, *Adsorption, Carbon filters, Polymers, Pore size, Toxins, Insecticides.

Organotin compounds are used as insecticides, fungicides, wood preservatives, acid corrosion inhibitors and additives to many products such as antifouling paints. They often appear as contaminants in wastewaters due to the wet blasting of boats during overhaul. The adsorption characteristics of aqueous solutions of tributyltin oxide onto activated carbons, polymeric adsorbents and synthetic carbonaceous substances was studied in a column with the aid of flameless atomic absorption spectrophotometry. The best adsorptive capacities were displayed by OL20X50 and Filtrasorb 300 which both contain a high percentage of macropores. At breakpoint, the adosrptive capacity for this carbon was 0.30 and the capacity at exhaustion with 30 milligrams/liter organotin solution is 0.50. The high capacity of this activated carbon would allow long-term operation without the need of any regeneration. (Geiger-FRC)

WASTEWATER TREATMENT WITH POWDERED ACTIVATED CARBON,

Water Pollution Control Authority, Vernon, CT.
C. Pitkat, and C. Berndt.
Public Works, Vol 112, No 10, p 54-56, October, 1981. 3 Fig.

Descriptors: *Wastewater treatment, *Solids, *Chlorination, *Carbon, *Sludge, Suspended solids, *Activated carbon, Aeration, Activated sludge, Biomass, Effluent standards, Digested sludge, Slurries, Sludge filters, Biochemical oxygen demand, Vernon, Connecticut.

Wastewater treatment using powdered activated carbon and a wet air oxidation process for carbon regeneration has met with success in Vernon, Connecticut. The treatment facility receives both domestic and industrial wastes. Wastes from a synthetic textiles plant contain dyes and chemicals which produce high color, BOD and COD levels. The carbon regeneration unit has demonstrated autogenous operation, requiring no outside fuel or heat source once up to operation temperatures of over 400 degrees. Simultaneously with carbon regeneration, the wet oxidation unit has reduced the associated biological solids to a small amount of inert ash, disposable by landfilling. The wet oxidation unit has successfully regenerated spent carbon slurry, and carbon recoveries for the regeneration system have averaged greater than 95 percent. (Titus-FRC)

TREATMENT PLANT FEATURES ULTRAVIOLET DISINFECTION,

C. F. Guarino, and W. C. Wren.
Public Works, Vol 112, No 10, p 82-83, October, 1981. 2 Fig.

Descriptors: *Wastewater treatment, *Disinfection, *Ultraviolet radiation, Solids, *Biodegradation, Anaerobic digestion, Solar energy, Peak flow, Seasonal variation, Discharge, Hydraulics, Design criteria, *Wastewater facilities, Pella, Iowa.

The design of a wastewater treatment plant soon to be installed in Pella, Iowa, is described. It uses solar energy to aid in anaerobic digestion and features one of the first full-scale wastewater disinfection systems using ultraviolet light. Each ultraviolet lamp and jacket is made of high grade natural quartz that allows a minimum 95 percent transmission of 2537 angstrom wave length light through the wastewater. Lamps are rated for 7500 hours of life with an output of 40 watts at the germicidal frequency. Safety, avoidance of generation of toxic byproducts, virus inactivation and space requirements were important considerations in selecting the design. (Titus-FRC)

UPGRADING WITH ROTATING BIOLOGICAL CONTRACTORS FOR AMMONIA NITROGEN REMOVAL,

Rhode Island Univ., Kingston. Dept. of Civil and Environmental Engineering.
C. P. C. Poon, H. K. Chin, E. D. Smith, and W. J. Mikucki.
Journal of the Water Pollution Control Federation, Vol 53, No 7, p 1158-1165, July, 1981. 4 Fig, 17 Ref.

Descriptors: *Biological treatment, *Ammonia, *Effluents, Trickling filters, *Wastewater treatment, Water quality standards, Nitrogen, Nitrification, *Nitrogen removal.

A pilot plant was used to evaluate the utility of a rotating biological contractor process in upgrading a trickling filter system for biochemical oxygen demand reduction and nitrification. The rotating biological contactor system was designed to treat substandard trickling filter effluent. The pilot plant consisted mainly of a 0.5 cm-diameter, four-stage RBC module and a 0.51 m-diameter clarifier. The unit rate of NH3-N removal was low compared to the same RBC process used specifically for NH3-N removal and followed a logistic-S curve or second-order kinetics. The biofilm on the rotating media was very thin, thus a high-density media should be used. Average sludge retention time was 19.8 days, and 0.31 g MLSS/g soluble BOD5 was removed. Nitrification rather than BOD removal controlled the size of the unit selected for application. (Small-FRC)

INFILTRATION/INFLOW SOURCE IDENTIFICATION BY COMPREHENSIVE FLOW MONITORING,

Montgomery (James M.) Inc., Walnut Creek, VA.
D. C. W. DeCoite, R. A. Tsugita, and R. Petroff.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1620-1626, November, 1981. 7 Fig, 4 Tab.

Descriptors: *Sewer infiltration, *Flow measurement, *Monitoring, Infiltration, Rainfall, Computers, Rainfall infiltration, Sewers, Massachusetts, *Sewer systems.

Procedures are presented for the comprehensive flow monitoring program for the Fairfield-Suisun District's (California) sewer system evaluation survey. The flow monitoring program was designed to accurately measure wastewater flows

before, during, and after a significant rainfall event. Areas of significant infiltration/inflow were to be further isolated by smoke testing and television inspection. A competerized flow monitoring program was utilized which was capable of providing synchronized flow readings every 15 minutes within a 15% range of accuracy. The program identified excessive and nonexcessive infiltration/inflow areas, and non-critical areas were quickly eliminated from investigation. Potential savings included reduced costs for smoke testing and television testing programs. (Small-FRC)

RECOMMENDATIONS FOR REGULATORY MODIFICATIONS: THE USE OF WASTE STABILIZATION POND SYSTEMS,

Texas Univ. at Austin. Engineering Department. Dept. of Engineering.
E. F. Gloyna, and L. F. Tischler.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1559-1563, November, 1981.

Descriptors: *Stabilization ponds, *Algae, *Organic carbon, *Wastewater treatment, *Biochemical oxygen demand, Performance evaluation, Water pollution control.

A position on the regulation of waste stabilization pond systems, including limitations on suspended solids, is presented. The position was developed through the evaluation of existing waste stabilization pond systems, the comparison of waste stabilization systems with exemplary activated sludge systems, and studies of algal metabolism as it relates to teceiving waters. A study of four stabilization ponds in Texas indicated that the highest long-term average effluent total BOD5 was 25 mg/liter, and more than 83% of the influent total organic carbon was removed. Waste stabilization ponds were found to remove essentially all priority pollutants and were as effective as high-rate systems. Algal cells in the effluent from properly designed and operated stabilization pond systems did not significantly impact receiving waters. (Small-FRC)

STOCHASTIC MODELING OF AN INDUSTRIAL ACTIVATED SLUDGE PROCESS,

Vanderbilt Univ., Nashville, TN. Dept. of Chemical Engineering.
K. A. Debelak, and C. A. Sims.
Water Research, Vol 15, No 10, p 1173-1183, October, 1981. 14 Fig, 7 Tab, 22 Ref.

Descriptors: *Stochastic process, *Activated sludge process, Mathematical studies, Probabilistic process, Model studies, *Wastewater treatment, Water treatment facilities, Industrial wastes, Biological oxygen demand, Chemical oxygen demand, Oxygen demand.

A Box-Jenkins time series transfer function model was developed for the effluent chemical oxygen demand (COD) using the influent COD, from a sewage treatment process. The data for the study came from an industrial waste treatment plant. The COD data are reported on a daily basis and cover a 14 month period. Typical plant operating conditions are as follows: influent flow, 1.8 GPM; recycle flow, 1.4 GPM; food to microorganisms ratio (loading factor) BOD, 0.15/day, COD, 0.34/day; dissolved oxygen, 3.3 mg/liter; mixed liquor total suspended solids 4600 mg/liter; volatile suspended solids 2850 mg/liter; recycle total suspended solids 18,300 mg/liter; volatile suspended solids 10,300 mg/liter. The outcome of this study and the reanalysis of Berthouex's results in light of the Akaike information criterion (AIC) seem to indicate that a transfer function model based on influent and effluent BOD or COD data alone is not sufficient to accurately predict the behavior of activated sludge plants. While improvement in the prediction of the outputs was achieved with a single difference model even though the two studies were performed on plants with highly different characteristics, it may be possible to improve the outcome still further by including other parameters such as flow, loading, or temperature as inputs to a transfer function model which would improve the model performance. The Box-Jenkins techniques to study the dynamics of activated sludge is useful in determining whether a plant exhibits process instabilities and could benefit from automatic process control. The plant studied here does not fall into that category. (Baker-FRC)

METHODS FOR EVALUATING PERFORMANCE OF FILTER MEDIA,

Metcalf and Eddy, Inc., Boston, MA.
S. L. Bishop.
Water/Engineering and Management, Vol. 128, No 2, p 64, February, 1981.

Descriptors: *Filter media, *Evaluation, Filtration, Separation techniques, Turbidity, Testing procedures, Water treatment, Silt, Head loss, *Performance evaluation.

Various techniques exist for evaluating the performance of a given filter media. These include use of turbidity as a method for evaluating performance and use of microscopic counts as a supplemental procedure to determine the suspended solids passing through the filter and not picked up as turbidity. Head loss data are also useful, since head loss results as a function of the rate of flow and the solids contained in the water. Thus it is an excellent means of determining the responsiveness of the media for a particular water quality. Another process is the net unit production determination. Yet another involves the determination of the silt density index developed for the reverse osmosis process to determine the magnitude of the solids contained in the feed water to the desalting process. COMPARATIVE PERFORMANCE OF SYNTHETIC ADSORBENTS AND ACTIVATED CARBON FOR SPECIFIC COMPOUND REMOVAL FROM WASTEWATERS,

Michigan Univ., Ann Arbor.
B. M. van Vliet, and W. J. Weber, Jr.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1585-1598, November, 1981. 8 Fig, 5 Tab, 7 Ref.

Descriptors: *Activated carbon, *Adsorbents, *p-Toluene sulfonate, *p-Chlorophenol, *Wastewater treatment, Performance evaluation, Pollutants, Organic compounds.

The performance characteristics of a selection of eight synthetic adsorbents and two activated carbons were compared with respect to removal of an array of organic compounds. The compounds were: p-toluenesulfonate, p-chlorophenol, dodecylbenesulfonate, phenol, lindane, and carbon tetrachloride. When the equilibria and dynamics of adsorption of p-toluenesulfonate and p-chlorophenol were evaluated for the ten substances, significant differences were found. The carbons generally performed best, followed by the carbonaceous adsorbents and the polymeric and resinous adsorbents. Intraparticle transport dynamics differed widely. The carbonaceous adsorbents exhibited the lowest intraparticle diffusivities, and the macroporous polymeric and resinous adsorbents demonstrated the highest values. (Small-FRC)

TRACE METAL CONCENTRATIONS IN OXIDATION PONDS,

Ecological Analysts, Inc., Oak Ridge, TN.
J. S. Suffern, C. M. Fitzgerald, and A. T. Szluha.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1599-1608, November, 1981. 1 Fig, 9 Tab, 44 Ref.

Descriptors: *Heavy metals, *Tilapia, *Oxidation ponds, Food, Fish, Bioaccumulation, Trace metals, Cadmium, Copper, Zinc, Lead, Nickel, Chromium.

The levels of the heavy metals cadmium, chromium, copper, nickel, lead, and zinc in the muscle and liver tissues of tilapia grown in wastewater oxidation ponds were determined. Also, the heavy metal concentrations of the wastewater, sludge, and other biotic components of the system were determined. Metal levels in the wastewater were lower than those found in most secondary effluents, and concentrations in the biotic components of the system indicated minimal metal accumulation. The tilapia grown in the ponds did not accumulate heavy metals, and concentrations observed were below levels set for foodstuffs. Thus, heavy metals may not be a limiting factor in the use of wastewater as a nutrient when growing tilapia for human consumption. (Small-FRC)

COMBINED EFFECTS OF CADMIUM AND NICKEL ON ACTIVATED SLUDGE PROCESS,

Virginia State Health Dept., Richmond.
M. M. Bagby, and J. H. Sherrard.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1609-1619, November, 1981. 9 Fig, 1 Tab, 44 Ref.

Descriptors: *Cadmium, *Nickel, *Activated sludge process, Heavy metals, Biological wastewater treatment, Chemical oxygen demand.

The effects of heavy metals on biological wastewater treatment were determined in this study of the combined effect of cadmium and nickel on the performance of bench-scale, continuous flow activated sludge units. At given influent COD concentrations, higher concentrations of cadmium and nickel resulted in decreased COD removal efficiency at a given mean cell residence time. COD removal efficiency decreased as the ratio of total influent metal concentration to total system suspended solids increased. The toxic effects of heavy metals were stronger on nitrifying organisms than on heterotrophic organisms. Thus, heavy metals can cause reduced system efficiency under some conditions. (Small-FRC)
W82-02704

REDUCED ENERGY USAGE WITH BIOLOGICAL PHOSPHORUS REMOVAL,

Metcalf and Eddy, Inc., NY.
J. Dedyo, and R. Doan, Jr.
Journal of the Water Pollution Control Federation, Vol 53, No 7, p 1166-1171, July, 1981. 3 Fig, 3 Tab, 1 Ref.

Descriptors: *Biological treatment, *Phosphorus removal, *Costs, Energy, Lime, *Wastewater treatment, Landfills.

The energy-use reductions and resulting cost reductions made possible by replacing a conventional lime post-precipitation phosphorus removal system with a biological phosphorus removal system are discussed. The proprietary process was retrofitted to the existing lime post precipitation phosphorus plant at the Amherst, New York, Water Pollution Control Facility. The plant was about 80% complete, so the flow scheme was revised to incorporate the biological phosphorus removal process with the least possible impact on piping, etc. Two alternatives for handling the lime sludge from the reactor clarifier were examined: recalcining and landfilling. With only minor piping modifications, either alternative would be possible. Energy reductions exceeded 70% for each alternate, with an annual decrease in operating costs of about $958,000 for the recalcining alternative and $1.05 million for the landfill alternative. Thus, the biological phosphorus removal system can be incorporated into an activated sludge treatment system to reduce energy and chemical usage. (Small-FRC)

OBTAINING HIGH-LEVEL WASTEWATER DISINFECTION WITH OZONE,

Oklahoma State Univ., Stillwater. Dept. of Civil Engineering.
E. L. Stover, and R. W. Jarnis.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1637-1647, November, 1981. 10 Fig, 7 Ref.

Descriptors: *Ozonation, *Coliforms, *Disinfection, Ozone, *Wastewater treatment, Performance evaluation, Massachusetts.

Ozone was evaluated as a wastewater disinfectant under stringent bacteriological standards typical of those required of wastewater discharges. The evaluation was conducted at the Marlborough Easterly Wastewater Treatment Plant (Massachusetts), and included process control, reliability, and pretreatment requirements. Over a wide range of operating conditions, good correlation was obtained btweeen total coliform reduction and absorbed ozone dose and between total coliform reduction and effluent total residual oxidants. The log total coliform reduction was a function of the ozone utilized: the more ozone was transferred into the wastewaters, the more bacteria were removed. The amount of absorbed ozone necessary to achieve a certain disinfection level was different for different wastewater qualities. The required ozone dose should be determined experimentally prior to the design of the disinfection system. (Small-FRC)

OPERATION REPORTS: EAST BAY MUNICIPAL DISTRICT (SD NO 1), CALIFORNIA.

Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1660-1664, November, 1981, 1 Tab.

Descriptors: *Treatment plants, *Operating costs, *Maintenance, Wastewater treatment, Sludge treatment, East Bay Municipal Utility District, California.

An operations report is presented on wastewater treatment at the Special District No. 1 of the East Bay Municipal Utility District, which serves the California cities of Alameda, Berkeley, Emeryville, Oakland, and Piedmont. Activities during the year in the wastewater treatment section included cleaning the vacuum filter-filtrate system of struvite deposits. A major problem developed with the waste sludge thickening centrifuge when the conveyor scroll shaft broke and was out of service for 15 days. The primary sedimentation tanks became overloaded until the unit was rebuilt. Odor monitoring and control programs were carried out, and an energy conservation program reduced power usage by 20%. In the maintenance section, activities included overhauling one of the five 42-in influent pumps and development of new shaft sleeves. The processing unit removed a total of 2750 cu m of grit, sand, and silt, and treated plant flows of up to 636,000 cu m/day. (Small-FRC)

PREVENTION OF PUTREFACTION IN ORGANIC SLUDGE BY CO-PRECIPITATION OF BACTERICIDE AND COAGULANT,

Tokyo Science Univ. (Japan). Faculty of Pharmaceutical Science.
S. Suzuki, and K. Kobayashi.
Environmental Pollution (Series A) Vol 26, No 3, p 187-192, 1981. 2 Fig, 3 Tab, 5 Ref.

Descriptors: *Flood processing industry, *Bactericides, *Coagulants, Fermentation, Meat processing industry, *Wastewater treatment, Industrial wastewater, Carbamate pesticides, Sodium dimethyldithiocarbamate, Iron compounds, Sedimentation, Organic matter.

Precipitated organic sludge produced during chemical treatment of fish-meat processing effluent was prevented from generating gas and floating to the surface by the addition of 60 mg per liter sodium dimethyldithiocarbarmate, a bactericide, and ferrous sulfate, a coagulant. Other bactericides tested, in decreasing order of performance in conjunction with ferrous sulfate, were ammonium ethylenebisdithiocarbamate, sodium pentachlorophenol, and 8-hydroxyquinoline. Precipitation decreased with increasing pH from 5 to 9. In fermentation tests sodium dimethyldithiocarbamate and ammonium ethylenebisdithiocarbamate were more effective than the other two bactericides in suppressing gas formation in the sludge. The coagulant ferrous sulfate, ferric sulfate, aluminum sulfate, and polyaluminum chloride were tested with sodium dimethyldithiocarbamate at a 1:1 molar ratio of metal to bactericide. All but the polyaluminum chloride showed precipitation of 90% or higher at neutral pH, indicating that the bactericide can be safely removed from the effluent. Varying the metal: bactericide ratio from 0.5 to 5 showed that over 90% precipitation occurred, even with 1 to 0.5 ratios of metal: bactericide. (Cassar-FRC)

A NEW METHOD OF REGENERATION OF ANION EXCHANGERS USED FOR RECOVERING CHROMATES FROM WASTEWATER,

Maria-Curie Sklodowska Univ., Lublin (Poland). Dept. of Chemical Technology.
L. Pawlowski, B. Klepacka, and R. Zalewski.
Water Research, Vol 15, No 10, p 1153-1156, October, 1981. 6 Fig, 1 Tab,

Descriptors: *Waste recovery, *Chromates, *Wastewater treatment, Recycling, Regeneration, Anion exchange.

A new and economically attractive method for the recovery of water and chromates from wastewater is presented. By cutting off the frontal and tail parts of the regeneration effluent and returning them to the raw wastewater, a significant increase in concentration of the regeneration effluent can be obtained. Not only is this possibility considered, but also the relations between dose of sodium hydroxide used for regeneration, flow rate of sodium hydroxide solution, average concentration of regeneration effluent, recirculation ratio and apparent ion exchange capacity. The application of highly concentrated sodium hydroxide for regeneration of the weakly basic anion exchanger bed resulted in a significant increase in the concentration of the recovered solution of chromates. A further increase in the concentration of the regeneration effluent can be obtained by recycling a certain part of the front and tail regeneration effluent to raw wastewater. However, this recirculation caused a decrease in the effective sodium hydroxide utilization ratio. From the data offered in this report, one can choose the optimal parameters for particular requirements. (Baker-FRC)

PERFORMANCE PREDICTIONS FOR REMOVAL OF TOXIC AND CARCINOGENIC COMPOUNDS FROM WATER SUPPLIES BY ADSORPTION,

Michigan University.
M. Pirbazari.
PhD Dissertation, 1980. 477 p, 171 fig, 33 Tab, 168 Ref, 12 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-29039.

Descriptors: *Water pollution treatment, *Model studies, *Mathematical models, Activated carbon, Adsorbtion, Organic compounds, Polychlorinated biphenyls, *Carcinogens, Pollutants, Trace levels, Dieldrin, Carbon tetrachloride, Benzene.

Treatment with granular activated carbon is a technically and economically viable technology for removal of a broad spectrum of compounds of concern from public water supplies. The efficiency and cost effectiveness of the design and operation of this process, however, are markedly dependent upon optimum utilization of the adsorption capacity of the carbon, consistent with treatment objectives. To accomplish efficiency and cost effectiveness, it is necessary to develop appropriate data regarding system dynamics, and to synthesize the body of this data in such a manner as to render it incorporable in actual plant design and operation. Mathematical modeling and simulation of the dynamics of granular carbon systems can be a particularly effective means for syntheses of data regarding adsorption dynamics, and resultant models can be employed to good advantage in prediction of system performance under a variety of conditions. The research described has focused on development of rate and equilibrium data relative to the adsorption of several representative compounds of natural, industrial, and agricultural origin from water by actived carbon. Further, the Michigan Adsorption Design and Applications Model (MADAM) - which has indicated substantial potential for use in the design and operation of granular carbon systems for wastewater treatment, has been used for simulation and prediction of the dynamic performance of carbon beds for removal of trace quantities of these compounds under conditions approximating those encountered in water treatment practice. BY-PRODUCT RECOVERY FINANCES TREATMENT,

Unitata Berhad, Teluk Anson (Malaysia).
J. Svensson, P. B. Sorensen, and C. M. Peterson.
Industrial Wastes, Vol 27, No 5, p 22-25, September/October, 1981. 1 Fig, 2 Tab.

Descriptors: *Oil wastes, *Industrial wastewater, *Flotation, Wastewater treatment, Oily water, Aminodan system, Unitata Berhard, *Malaysia, *Palm oil, Flocculation, Byproducts.

The Aminodan system for treating wastewaters containing suspended solids, grease, fat, oils, and proteins converts removed solids into a usable byproduct. The Unitata Berhad plant in Malaysia processes 125,000 tons of palm oil annually, using 29 million gal of process water. The Aminodan system recovers 90% of the solid material, which is converted to acid oil to use in the manufacture of detergents and plastics. Hot, acid effluent is collected in a pit and mixed with cooler water before the dissolved air flotation process, which removes 92% of total fatty matter. Remaining emulsified effluent is clarified with polyelectrolyte and alum flocculation and pumped to anaerobic ponds, where it remains for 5 months until effluent standards are reached. Fatty sludge is deposited in a dump site. In 1980 the company realized a net return of $167,547 over the total operating costs. The system cost $226,160 to install in 1979. (Cassar-FRC)

FIELD REPORT ON A NONPOLLUTING BLEACH PLANT,

Billerud-Uddeholm A. B., Skoghall (Sweden).
H. B. Borjeson, and S. Lindberg.
Tappi, Vol 64, No 10, p 89-93, October, 1981. 5 Fig, 2 Tab, 7 Ref.

Descriptors: *Pulp and paper industry, *Bleaching wastes, *Ion exchange, Adsorption, Costs, Kraft mills, Wastewater treatment, Industrial wastewater, *Color removal, Sweden.

A second generation treatment plant for bleached kraft mill effluent went on stream in 1981 at the Billerud works near Lake Vanern, Sweden. Evolved from a 1973 plant in which colored matter was adsorbed on ion exchange columns followed by elution with alkali, the new plant is semicontinuous. The effluent flow is continuous, but the resin is intermittently transferred to separate columns, each designed for a given unit operation. Advantages of the system are adaptability to varying bleaching conditions, more efficient

design, minimum amount of resin needed, and lower cost. Discharges from the plant per ton of pulp are: color, 18 kg Pt; organic chloride, 1.5 kg, inorganic chloride, 76 kg; COD, 34 kg 02; BOD, 10 kg 02, and chlorophenols and chloroguaiacols, 3 g. In most categories there are considerable reductions in pollutants compared with conventional plants. Costs for this pioneering installation are $4.5 million for construction, $650,000-$900,000 for annual operating costs, and $125,000 for maintenance and labor. The annual production of bleached pulp is 100,000 tons. (Cassar-FRC)

A MULTIMEDIA INFORMATION PACKAGE REGARDING LAND APPLICATION OF WASTEWATER AND SLUDGE: A STUDY OF TRAINING DISSEMINATION SPECIALISTS, EVALUATION METHODS, AND COST-EFFECTIVENESS,

Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
L. A. Phillips, R. H. Downing, J. C. Frey, and C. H. Sink.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168600, Price codes: A07 in paper copy, A01 in microfiche. Research Project Technical Completion Report, November, 1981. 127 p, 1 Fig, 44 Tab, 5 Ref. OWRT-B-116-PA(4), 14-34-0001-8112.

Descriptors: *Training, Education, Instruction, Wastewater, Sludge, *Wastewater treatment, *Technology transfer, Information dissemination, *Land application, Information package, Cost analysis.

It is not always feasible for a research team to participate in the information dissemination process by attending meetings. This project attempted to provide an alternative means of disseminating information by producing, and evaluating the effectiveness of, a multimedia technology transfer package on land application of wastewater and sludge. The package did not require the scientists to be at the presentation. Video and printed materials were produced and discussion leaders trained. Presentations were made in 14 Pennsylvania communities to 310 registered participants. Evaluations were obtained from 136 participants and 12 discussion leaders. Results indicated that the program reached community decision-makers. Overall reaction was favorable although some participants indicated the program's content was too general. The video method of presentation met with mixed reactions. Some participants indicated a need for 'live' experts on the scene. Presentations that combine the use of video materials with a scientist present would be worth considering. The cost-effectiveness of the LAWWS program was determined by comparing its planning, production and delivery costs with those for a similar program presented live by research scientists. The cost of the LAWWS package was found to be greater for the first 43 presentations. After that, LAWWS was the more economical program. (Fisher-PA)

BRITAIN'S SEWERS - RESEARCHING FOR THE FUTURE,

Water Research Centre Engineering Centre, Swindon (England).
D. Fiddes.
Water Services, Vol 85, No 1026, p 431-432, 435, August, 1981. 2 Fig, 9 Ref.

Descriptors: *Sewer systems, *Maintenance, *Research priorities, Sewers, Rehabilitation, Planning, *United Kingdom.

The objectives of the Water Research Centre's sewerage research program are discussed, and the principal features of the program are described. The program was designed to establish the condition and rate of deterioration of sewers to help develop cost effective strategies for replacement and rehabilitation programs as well as to aid in planning. The program will evaluate renovation techniques and provide guidance and develop methods for the assessment and improvement of the hydraulic performance of sewer systems. Guidance will also be provided in materials, design, and construction of new sewers. The main outstanding technical problem with sewer renovation is that of dealing with drain connections in non-man-entry sewers. (Small-FRC)

TOTNES SEWAGE TREATMENT, RESEWERAGE AND FLOOD PREVENTION SCHEME.

Water Services, Vol 85, No 1026, p 418, 421-422, 424-425, August, 1981. 4 Fig.

Descriptors: *Wastewater facilities, *Flood control, *Activated sludge process, Wastewater treatment, Domestic wastes, Food processing wastes, Stream stabilization, Sludge digestion, Methane, *United Kingdom.

The Totnes sewage treatment works was inadequate and located on a frequently flooded site. The decision was made to build a completely new facility and implement a joint resewerage and flood prevention scheme. The existing foul sewerage system was improved, and major water courses which outfall in culverts throughout the town were culverted and controlled. The new treatment works includes an oxygenated activated sludge plant to treat domestic wastes and wastes from a nearby creamery and pig slaughtering and processing plant. Sludge is treated by anaerobic digestion and dewatering. Methane gas produced during the digestion is used to burn screenings and heat the buildings. The project was begun in 1978, and completion was expected in July 1981. (Small-FRC)

ADVANCED SLUDGE TREATMENT FOR MODERN WATERWORKS,

East Surrey Water Co. (England).
K. Sharp, and J. H. Warden.
Water and Waste Treatment, Vol 23, No 9, p 36, 39, September, 1980. 2 Fig, 5 Ref.

Descriptors: *Wastewater treatment, *Wastewater facilities, *Sludge thickening, Design criteria, Dewatering, Sludge drying, Sludge solids, Sludge filters, Polymers, Polyelectrolytes, Training, Bough Beach Waterworks, England.

Methods explored by the Bough Beach Waterworks of the East Surrey Water Company to treat, eventually, up to 10 mgd of impounded surface water are examined. Gravity thickening of sludge was introduced to improve treatment of sludge on drying beds. The effectiveness of polymer thickening of several coagulant sludges was demonstrated as long as certain criteria were met. The Water Research Center was asked to design a new sludge treatment plant at Bough Beach that could be built as quickly and as cheaply as possible and be operated within existing manning schedules. The resultant facility can handle about 20 milligrams of sludge solids/liter of raw water treated. A hopper-bottomed sludge tank was used as a balancing tank to buffer batch flows of settled wash water. A single thickener with mechanical backups and two main feed pumps was installed. Sludge pressing was most feasible for sludge dewatering, and a second hopper-bottomed tank can provide storage for up to three days capacity of 125 inch cakes. A flowsheet of the new plant operations is given, and the teamwork used in the training of personnel is discussed. (Geiger-FRC)

BIODEGRADATION OF AROCLOR 1221 TYPE PCBS IN SEWAGE WASTEWATER,

National Water Research Inst., Burlington (Ontario).
D. Liu.
Bulletin of Environmental Contamination and Toxicology, Vol 27, No 5, p 695-703, November, 1981. 5 Fig, 20 Ref.

Descriptors: *Polychlorinated biphenyls, *Biodegradation, Bacteria, *Wastewater treatment, Water treatment facilities, Temperature, Dissolved oxygen, Acidity.

The objective of this study was to assess the biodegradation of commercial PCB formulations in municipal sewage, including the factors affecting the degradation. A selected PCB-degrading bacterium, Pseudomonas sp. 7509, was added as inoculant. The bench scale test of PCB biodegradation was carried out in a 14-liter fermentor equipped with automatic temperature, pH, dissolved oxygen and agitation speed controls. In a typical batch operation, the fermentor was charged with 10 liters of fresh raw sewage which was fortified with 20 ppm each of phosphorus and nitrogen. The temperature was automatically controlled at 20 degrees C, agitation at 400 rpm, and 2 ppm dissolved oxygen in the fermentor broth. Results indicate that Pseudomonas sp. 7509 could oxidize commercial PCB formulations at a rapid rate. If this bacterium is to be considered as a seeding culture for wastewater treatment, it is essential that the bacterium be able to degrade PCBs in the presence of other organic nutrients normally found in wastewater. Since the temperatures of sewage treatment plants in Canada vary considerably with the seasons, it was decided to test the ability of P. sp. 7509 to oxidize PCBs at different temperatures. Even at a temperature as low as 4 degrees C this bacterium was still able to oxidize the Aroclor 1221. The rate of Aroclor 1221 degradation was intimately dependent on the agitation speed of the fermentor's impeller. (Baker-FRC)

PREDICTING REACTOR BIOMASS CONCENTRATION IN A FLUIDIZED-BED SYSTEM,

Dorr-Oliver, Inc., Stamford, CT.
W. K. Shieh, P. M. Sutton, and P. Kos.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1574-1584, November, 1981. 9 Fig, 3 Tab, 25 Ref.

Descriptors: *Fluidized bed process, *Mathematical models, *Biomass, Particle size, Particle shape, Mathematical studies, *Wastewater treatment.

A hydraulic model was developed and used to predict the biomass concentration observed during the operation of two fluidized-bed pilot plants. Media size and biofilm thickness are important variables in biomass concentration. The irregularity in particle shape can be accounted for by the volume-equivalent spherical diameter, while the irregularity in particle size can be accounted for by the Sauter mean diameter. Biofilm dry density is a function of biofilm thickness and decreases with increasing biofilm thickness at a given bulk liquid substrate and compared to measured values. Biofilm dry density, biofilm wet density, and the biofilm moisture content were calculated and compared to the values predicted by the model. Relative errors were less than 10%. (Small-FRC)

ENGINEERING RESPONDS TO ECOLOGY,

Whitman and Howard, Inc., Wellesley, MA.
R. E. Hickman.
Water/Engineering and Management, Vol 128, No 10, p 33-34, 36, October, 1981. 3 Fig, 1 Tab.

Descriptors: *Sewer systems, *Construction, Mill River Valley, Environmental engineering, Civil engineering, Engineering, Environmental protection.

A description is offered of the Mill River Valley Sewer Program for Fairfield, Connecticut. The system called for the installation of 35 miles of sewers in an extremely sensitive ecological area. This area included residential neighborhoods with beautifully landscaped lawns, was in a possible national historic site, was near inland and coastal wetlands which were abundant with flora and fauna, and was within a public watershed with

swimming beaches, recreational waterways, and groundwater public well fields. However, the area had suffered for years from inadequate septic systems which gave forth such problems as odors, overflows, and limited household water use. Septic runoff was also seeping into the Mill River and its impoundments, polluting waters used by residents for fishing, swimming, canoeing, and ecological education. The $18,000,000 Mill River Valley Sewer Program brought sewerage service to about 2,000 Fairfield homes and is capable of serving portions of the neighboring town of Easton. The program required close coordination of local commissions, citizen groups, federal and state agencies, and environmental and engineering consultants. The use of town owned land avoided the cost and complications of purchasing private property. The program demonstrated that engineers and environmentalists can work together to economically and practically clean up the environment without sacrificing either technical expertise or ecological concern. WIND AERATION IN MODEL WASTE TREATMENT SYSTEM,

Asian Inst. of Tech., Bangkok (Thailand). Div. of Environmental Engineering.
C. Polprasert, P. A. Kahn, and N. C. Thanh.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1089-1094, October, 1981. 2 Fig, 1 Tab, 8 Ref.

Descriptors: *Aeration, *Wind, *Mixing, *Wastewater treatment, Oxidation, Chemical oxygen demand.

The potential of wind aeration in aerobic wastewater treatment was studied in a laboratory scale oxidation ditch. After deaerating the samples with sodium sulfite and cobalt chloride, an air blower was turned on to stimulate wind up to a velocity of 20 m per sec. Good mixing was obtained in tap water at wind velocities above 15 m per sec. At 20 m per sec the water velocity was 50 cm per sec on the surface and at the 12 and 17 cm depths, and 35 cm per sec at the 7 cm depth. Using mixed liquor suspended solids and wind velocities of 10-20 m per sec, the overall oxygen transfer rate coefficient was 1.2-9.5 per hour, the concentration of mixed liquor suspended solids was 1140-1610 mg per liter, and the oxygen utilization rate was 2-16 mg per liter per hour. COD removal efficiency at a wind velocity of 20 m per sec was tested at residence times of 2-20 days and influent COD concentrations of 280-620 mg per liter. At residence times of 10 days or longer, effluent CODs were less than 20 mg per liter (95% removal). (Cassar-FRC)

NEW DEVELOPMENTS IN PAPERMAKING IN WESTERN EUROPE,

Technical Univ. of Denmark, Copenhagen. Inst. fuer Papierfabrikation.
L. Gottsching.
Tappi, Vol 63, No 3, p 50-54, March, 1980. 4 Tab, 38 Ref.

Descriptors: *Industrial wastewater, *Pulp and paper industry, Biological oxygen demand, Oxygen demand, Chemical oxygen demand, Wastewater, Wastewater treatment, *Water pollution control, *Water law, *Europe.

Restrictions regarding environmental pollution, combined with other factors, have caused a slowdown in the economic growth of the paper making industry in Western European countries. National authorities of various countries are imposing increasingly strict regulations concerning effluents. Some mills have to meet individual restrictions depending on the capacity of the recipient, while in other countries the restrictions are the same for all mills or certain groups of mills producing the same paper grades, independent of the capacity of the recipient. In some countries mills must pay a direct or indirect tax or duty to the government for the effluents. In Germany an effluent duty will be introduced during 1981. The duty is calculated from the following parameters: effluent volume, suspended solids, COD, mercury and cadmium contents, and toxicity to fish. The average fresh water input in the German paper industry is about 45 cubic meters per ton of paper. The Schongau paper mill has a specific effluent volume of 8 cubic meters/ton of newsprint despite the fact that it operates a groundwood mill and deinking plants. Separation methods are highly efficient, settled solids are normally fed back into the stock preparation system, and the wastewater emitted to the recipient is clarified mechanically, mostly through sedimentation. Descriptors: *Activated sludge, *Fauna, *Microorganisms, *Pilot plants, *France, Population dynamics, Wastewater treatment, Activated sludge process, Species composition.

A method of quantitative observation of the microfauna used for operational monitoring of purification plants was studied. A simple experiment was performed to monitor the start-up of the pilot purification station of the University of Sciences and Engineering of Languedoc, fed with municipal waste water from Montpellier. The density of microfauna was evaluated using a counting chamber technique, and the results correlated with physicochemical factors. The technique was quite reliable when the investigated volume reached 10 mm to the third power. Grouping the microfauna by trophic characteristics made the observation easier without losing too much information. The evolution of microfauna was determined by a set of parameters for which purification yield does not play a major role. The study of the daily evolution of microfauna showed 3 periods: a decrease and disappearance of some species in the first six days, a very unstable period in the next three days, and a more stable period in the next nine days. The set of parameters which do influence the evolution includes recirculation, extraction of sludges, oxygen share and the charge and nature of the effluent. (Hertzoff-FRC)

NONLINEAR PROGRAMMING DESIGN OF WASTEWATER TREATMENT PLANT,

Louvain Univ. (Belgium). Inst. d'Administration et de Gestion.
D. Tyteca, and Y. Smeers.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE4, p 767-779, August, 1981. 1 Tab, 19 Ref.

Descriptors: *Wastewater treatment, *Wastewater facilities, *Mathematical models, *Mathematical equations, Algorithms, Nonlinear programming, Optimization.

A complete mathematical model has been developed for a wastewater treatment plant comprised of six treatment units, including primary settler, activated sludge reactor, final settler, thickener, anaerobic digester, and vacuum filter. The model includes 43 equations with 51 variables and 12 inequality constraints. A nonlinear programming procedure has been set up for use in studying the optimal design of the plant. This procedure combines the advantages of geometric programming as a general and easy transcription mode for various types of models with the generalized reduced gradient as an efficient algorithm for solving large-scale highly nonlinear problems. The process for transcribing the model as a geometric pattern is demonstrated. A sample situation is used to demonstrate application of the model and the optimization method. Results can be obtained in moderate computer times, significantly reducing the costs associated with conventional design methods. The flexibility and interactivity of this method also allow for easy modification, replacement, or addition of constraints in the model. (Carroll-FRC)

NONLINEAR PROGRAMMING MODEL OF WASTEWATER TREATMENT PLANT,

Louvain Univ. (Belgium). Inst. d'Administration et de Gestion.
D. Tyteca.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE4, p 747-766, August, 1981. 1 Fig, 3 Tab, 40 Ref.

Descriptors: *Mathematical models, *Wastewater facilites, *Mathematical equations, Wastewater treatment, Nonlinear programming, Optimization, Anaerobic digestion, Activated sludge process, Vacuum filtration, Sedimentation, Pollutants, Suspended solids, Dissolved solids, Biomass.

Least cost design studies are intended to result in bringing the total discounted cost of the wastewater treatment plant to the lowest possible level while satisfying a set of constraints relating to effluent quality, performance relationships, and various biological and physical contraints limiting operational ranges of treatment units. This paper presents a complete mathematical model for a wastewater treatment plant which includes six treatment units: a primary settler, an activated sludge reactor, a final settler, a thickener, an anaerobic digester, and a vacuum filter. New equations developed for use in this model include a set of equations which permit description of the distribution of biodegradable materials into suspended and dissolved materials in the aerator and other modifications of classical relationships permitting disaggregation of the global polluting load into biodegradable suspended solids, biodegradable dissolved materials, and biomass. The global model is comprised of 43 equations and 51 variables (and therefore eight degrees of freedom) and 12 inequality constraints. To use the model properly, values must be given to the constants and parameters appearing in the equation. Data from the literature were used for testing this model. (Carroll-FRC)

EVALUATION OF THE FULL-SCALE APPLICATION OF ANAEROBIC SLUDGE DIGESTION AT THE BLUE PLAINS WASTEWATER TREATMENT FACILITY - WASHINGTON, D.C.,

W. Torpey, J. Andrews, and N. Mignone.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-219123, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-105, July, 1981. 6 p, 1 Fig, 4 Tab.

Descriptors: *Anaerobic digestion, *Sludge digestion, *Cost analysis, Thermophilic bacteria, Municipal wastewater, Pathogens, Microorganisms, Biodegradation, *District of Columbia.

The mesophilic-thermophilic digestion process is a new two-step concept for treating municipal wastewater sludges. The first step operates under mesophilic process conditions (digestion with anaerobic microorganisms at 90 to 100 F). The

second step operates under thermophilic process conditions (digestion with anaerobic microorganisms that thrive at 120 to 130 F). The existing Blue Plains wastewater treatment plant in Washington, D.C. treats approximately 330 mgd and much of the sludge generated is disposed of without digestion. It has been found possible to process the total waste sludge flow at the Blue Plains plant by adopting the thermophilic anaerobic digestion process to the present digestion facilities. Adoption of the thermophilic option at Blue Plains requires the least capital expenditure, would be the most expedient solution to the sludge management problem, and would yield substantial operational cost savings. It also offers the potential of eliminating the need for composting because of the pathogen kill. A limited expansion of digester capacity is required to handle the entire sludge stream. Digester gas would be available for sale to outside interests after internal heating requirements were satisfied. (Moore-SRC)

EVALUATION OF ION EXCHANGE TECHNOLOGY FOR TOXIC AND NON-CONVENTIONAL POLLUTANT REDUCTION IN BLEACH PLANT EFFLUENTS,

Jordan (Edward C.) Co., Inc., Portland, ME.
J. H. Fitch, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-208175, Price codes: A13 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-086, July, 1981. 6 p, 1 Fig, 3 Tab.

Descriptors: *Pulp and paper industry, *Bleaching wastes, *Ion exchange, *Wastewater treatment, Chlorinated hydrocarbons, Industrial wastewater, Resins, Cost analysis, Zinc, Copper, Cadmium, Nickel, Color removal, Chemical oxygen demand.

A literature review revealed that weakly basic ion exchange resins, based on a phenolformaldehyde matrix, are superior in treating pulp and paper bleach plant effluents. Prior to resin treatment, it is advantageous to adjust the pH and pretreat the wastestream. Screening and filtration remove macromolecular organics, which tend to foul the resin irreversibly. Batch and pilot plant ion exchange installations at Billerud Uddeholm AB in Skoghall, Sweden were evaluated in order to ascertain actual operation parameters and removal efficiencies, as well as associated problems and costs. The batch and pilot scale plants effectively remove color, COD, chlorinated guaiacols and some complexed metals. These treatment plants do not remove resin, fatty acids and phthalates. Inorganic chloride is removed initially but drops off shortly after the cycle starts. Zinc and copper are removed through complexation and chelation processes. Cadmium and nickel appear to be removed effectively in the second column but are virtually untouched in the first. Extended contact time yielded no benefits. Estimated capital cost for installing a full-scale plant to treat bleach plant wastes at a 100,000 metric ton/year plant (Kappa 35) is $4.78 million. Operation and maintenance costs are estimated to be $675,000/year, giving an annual cost (assuming a ten year investment at 10% interest) of about $1.15 million. (Moore-SRC)

PILOT-SCALE ANAEROBIC FILTER TREATMENT OF HEAT TREATMENT LIQUOR,

Hydroscience, Inc., Westwood, NJ.
E. Donovan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-218323, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-114, August, 1981. 5 p, 1 Fig, 4 Tab, 1 Ref.

Descriptors: *Wastewater treatment, *Sludge, *Cost analysis, *Anaerobic digestion, Biological treatment, Anaerobic filters, *Heat treatment, Municipal wastewaters.

The anaerobic filter's capability of removing large amounts of soluble organic matter with no oxygen required, at relatively low hydraulic detention times and low solids production, can result in distinct advantages for the pretreatment of high strength organic wastes. The liquor waste resulting from heat treatment of raw sludge in municipal sewage treatment plants contains high concentrations of soluble wastes, and is often returned to the head end of the plant where it can impose an additional load on the plant's operation and reduce its efficiency. A pilot plant study was conducted on the anaerobic filter treatment of heat treatment liquor. Significant removal of soluble organics from a high strength sludge heat treatment liquor can be achieved at hydraulic retention times of 0.5 to 2 days. The generated gas contained 65% to 70% methane. Based on the pilot column studies, a suggested design and costs for an anaerobic filter unit were developed. These costs were compared with costs of other means of treatment such as the aerobic alternative. The anaerobic filter process had lower capital and operating costs than other modes of treatment. The gas produced would be sufficient to maintain the temperature of the filter at 35 C and provide additional fuel for other uses. These calculations show a net profit in operating costs. (Moore-SRC)
W82-02972

WASTEWATER TREATMENT BY A PROTOTYPE SLOW RATE LAND TREATMENT SYSTEM,

Cold Regions Research and Engineering Lab., Hanover, NH.
T. F. Jenkins, and A. J. Palazzo.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A106 975, Price codes: A04 in paper copy, A01 in microfiche. Army Corps of Engineers CRREL Report 81-14, August, 1981. 52 p, 15 Fig, 26 Tab, 68 Ref.

Descriptors: *Municipal wastewater, *Land disposal, *Wastewater disposal, *Spray irrigation, *Nutrient removal, Forages, Coliforms, Biochemical oxygen demand, Suspended solids, Organic carbon, Nitrogen, Phosphorus, Crop yield, Heavy metals, Percolation, Fertilization.

Six slow rate land treatment prototypes, three containing a Windsor sandy loam and three containing Charlton silt loam, were studied from June 1974-May 1980. The systems were spray irrigated with either primary or secondary wastewater at application rates ranging from 2.5 cm/wk to 15 cm/wk. Application schedules were also varied. The performance of forage grasses was studied to determine the yield and nutrient uptake under the various application regimes. On a mass basis, an average of 91% of the nitrogen (N) applied could be attributed to either plant uptake or percolation of soluble N, mainly nitrate. Nitrate concentrations in the percolate correlated with N loading rate. An N loading rate of 800 kg/ha resulted in a mean concentration of about 10 mg/L of nitrate-N in the percolate. Plant uptake of N was linearly related to N loading rate at loading rates less than 800 kg/ha. In this range, plant uptake accounted for about 60% of the N applied. Plant yields averaged 13.1 tonnes/ha, three times the average for the area. Mean phosphorus (P) concentrations in the percolate ranged from 0.03 to 0.07 mg/L and depended only slightly on application rate. Removal of P averaged greater than 99% for all application regimes. Water balance measurements indicated that evapotranspiration exceeded pan evaporation by a factor ranging from 0.86 to 1.17 over a 6-year period. Treatment of biochemical oxygen demand (BOD5), suspended solids, total organic carbon (TOC), and fecal coliform were excellent. Residual levels of BOD5, suspended solids, and TOC in the percolate averaged 1.3, 1.2 and 1.8 mg/L, respectively. Fecal coliform bacteria in the percolate were reduced to detection limits independent of whether the wastewater was pretreated or disinfected before application. A significant reduction in chloroform and other volatile trace organics was also found. Mean concentrations of chloroform were reduced from 9.6 microgram/L in the chlorinated primary wastewater to about 0.2 microgram/L in the test cell percolates. No significant downward movement of heavy metals was found 5 years after suspension of heavy metal application. Potassium (K) fertilization was necessary to balance the low K/N ratio of the wastewater. (Brambley-SRC)

ULTRAVIOLET DISINFECTION OF A SECONDARY WASTEWATER TREATMENT PLANT EFFLUENT,

HydroQual, Inc., Mahwah, NJ.
O. K. Scheible, and C. D. Bassell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-242125, Price codes: A08 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-152, September, 1981. 8 p, 5 Fig, 2 Tab.

Descriptors: *Ultraviolet radiation, *Disinfection, *Coliforms, *Wastewater treatment, Microbiological studies, Secondary wastewater, Photoreactivation, Cost analysis.

Although ultraviolet (UV) light has been an accepted disinfection technique for potable waters, its application to lower-grade waters has not been widely practiced, primarily because of a lack of efficient system design. Recent improvements have made the UV process a viable alternative to chlorindation for the disinfection of wastewater treatment plant effluents. UV disinfection of a full-scale secondary effluent was investigated during a 13-month field study at Waldwick, New Jersey. Second order does response relationships were developed and were found to provide a rational expression of the microbial response to UV dose. The UV absorbance coefficient was found to be an excellent parameter for use in the dose expression and in the design sizing of UV systems. Photoreactivation was observed and was significantly dependent on temperature. The phenomenon could result in an order of magnitude increase in coliform density at a temperature of 20 degrees C. In operation, the process was flexible and simple, requiring minimal maintenance. Estimated costs ranged between 1.2 and 0.8 cents/cu m for typical secondary treatment plants with flows between 0.044 and 4.4 cu m/sec, respectively. (Moore-SRC)

CHARACTERIZATION OF BOLIDEN'S SULFIDE-LIME PRECIPITATION SYSTEM,

Kentucky Univ., Lexington. Dept. of Chemical Engineering.
M. Blythe, K. Schwitzgebel, J. C. Terry, C. Sund-Hagelberg, and D. Bhattacharyya.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-209272, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-081, August, 1981. 8 p, 5 Fig, 5 Tab, 6 Ref. R804568.

Descriptors: *Wastewater treatment, *Sulfides, *Heavy metals, *Arsenic, *Industrial wastewater, Chemical treatment, Chemical precipitation, Copper, Cadmium, Mercury, Lime.

Sulfide precipitation is an effective process for the treatment of industrial wastes containing highly toxic heavy metals. The attractive features of the sulfide precipitation process are: attainment of a high degree of metal removals over a broad pH range, effective precipitation of certain metals (such as As, Cu, Cd, Hg) even at very low pH, low detention time requirement in the reaction tank because of the high reactivity of sulfides, and the feasibility of selective metal recovery. Bench-scale studies were conducted with actual scrubber wastewaters obtained from a non-ferrous metal production plant. Full-scale data were obtained at Boliden Metall Corporation, Skelleftehamn, Sweden. A high degree of separation of heavy metals and arsenic was achieved using a combination of hydroxide-sulfide precipitation (at pH 8-9) process, and a process involving sulfide precipita-

tion (at pH 3-5) followed by lime precipitation. The combination hydroxide-sulfide process required only 60% of the theoretical sodium sulfide dosage to provide effective separations of heavy metals and arsenic. Simple sulfide precipitation at pH 3-4 also provide excellent removals for Cu, Cd, Hg, and Pb. For precipitation of arsenic and zinc sulfide at less than pH 5, the side reaction between sulfite (if present in wastewater) and sulfide must be considered. Hydrogen sulfide gas formation was never found to be a problem during precipitation because of the high reactivity of sulfides and heavy metals. (Moore-SRC)

CHLORINE DIOXIDE FOR WASTEWATER DISINFECTION: A FEASIBILITY EVALUATION,

Stanford Univ., CA. Dept. of Civil Engineering.
P. V. Roberts, E. M. Aieta, J. D. Berg, and B. M. Chow.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-213357, Price codes: A08 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-092, July, 1981. 4 p, 3 Fig, 2 Tab.

Descriptors: *Wastewater treatment, *Disinfection, *Chlorine dioxide, *Chlorination, Chlorinated hydrocarbons, Coliforms, Viruses, Effluent, Residual chlorine, Sludge.

Chlorine dioxide was compared with chlorine for disinfecting wastewater in laboratory experiments. Chlorine dioxide disinfection was also demonstrated at a full-scale wastewater treatment plant. The criteria compared included coliform kill, inactivation of poliovirus and other indicators, and formation of halogenated organic byproducts. In general, chlorine dioxide accomplished a given fractional kill of total coliforms with a smaller product (residual x time) than did chlorine. For a given contact time, the residual required to achieve a given fraction kill of coliforms was 2 to 70 times smaller for chlorine dioxide than for chlorine. Considering both required residual and disinfectant demand, the required doses of the disinfectants were estimated to satisfy three assumed coliform disinfection levels with two types of effluents: conventional activated sludge and filtered, nitrified activated sludge. The required mass doses of the disinfectants were approximately equal for treating conventional activated sludge effluent. The required dose of chlorine was approximately 2 to 10 times greater than that of chlorine dioxide for treating filtered, nitrified effluent, depending on the coliform standard. The results of studies conducted at a full-scale plant generally agreed within a factor of two with the predictions from laboratory studies. For typical cases, chlorine dioxide is approximately 2 to 5 times as expensive as chlorine for disinfection, but chlorine dioxide forms much lower quantities of halogenated by-products and is more effective in inactivating viruses than is chlorine. (Moore-SRC)

OVERLAND FLOW TREATMENT OF POULTRY PROCESSING WASTEWATER IN COLD CLIMATES,

Notre Dame Univ., IN.
L. H. Ketchum, Jr., J. L. Withcrow, A. J. Cunningham, and R. L. Irvine.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-213225, Price codes: A07 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-093, July, 1981. 6 p, 1 Fig, 6 Tab.

Descriptors: *Food-processing wastes, *Wastewater treatment, *Overland flow, *Land disposal, Weather, Temperature effects, Industrial wastewater, Biological treatment, Evapotranspiration, Snow cover.

Land treatment of wastewater using overland flow methods has been effectively used in warm climates. A full scale wastewater treatment facility, including overland flow, was evaluated in northern Indiana, a cold climate. The treatment system included mechanical pretreatment facilities, a storage lagoon, a lagoon for batch chemical treatment of the overland flow effluent and rapid infiltration for effluent disposal. The facility treated wastewater from a duck processing plant. The wastewater was as amenable to biological treatment as domestic sewage and had similar concentrations of nutrients. Overload flow systems typically are limited to low permeability soils, but this system was located on a sandy loam soil with very high permeability. Bentonite was used to provide a percolation barrier below the grass covered surface. Total effluent flow averaged about 40% of the total influent, except during the winter. The high winter effluent flows resulted from low evapotranspiration rates, because the fields were snow covered, and low infiltration rates, because the ground was frozen. During all warm-weather periods, and under widely varying wastewater application schemes, the overland flow plots alone met the 1983 EPA limitations, except when algae problems were encountered. Some degree of treatment is possible in the winter, but the loading rate must be reduced, and unsatisfactory effluent returned for further treatment. Application of lagoon wastewater to an overland flow plot should be avoided if possible. (Moore-SRC)

WOOD PRESERVING INDUSTRY MULTIMEDIA EMISSION INVENTORY,

Acurex Corp., Mountain View, CA.
B. DaRos, B. Fitch, C. Franklin, M. Friedman, and R. Merrill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-205999, Price codes: A12 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-066, September, 1981. 7 p, 2 Tab.

Descriptors: *Wastewater treatment, *Industrial wastewater, *Evaporation, *Organic compounds, Sludge disposal, Surface runoff, Air pollution, Evaporation pans, Recycling, Water pollution control, *Wood preserving industry.

There are approximately 475 wood preserving plants in the United States. Wastewaters are generated as a result of the preservatives used, plant operations, surface runoff, and excess process water discharge. Solid residues include waste sludges from wastewater treatment, insoluble inorganic materials from waterborne salts, and contaminated soils from spills or drippage. Air emissions occur during wastewater evaporation processes. Industry's technical response to requirements for control of process wastewater has included increased recycling and evaporation of water using thermal evaporators, spray and solar ponds, and cooling towers to decrease aqueous discharges. Organic compounds are emitted to the atmosphere during evaporation. The rate of release is based on the type of evaporation system used: solar ponds, thermal (pan) evaporators, spray ponds, or cooling towers; the temperature (thermal) driving force used; the molecular weight and volatility of the substances; and the concentration of each component in solution following wastewater pretreatment. Eleven plants are likely to shut down and 10 others face potential shutdown if zero discharge regulations are implemented. (Moore-SRC)

PROTEIN RECOVERY FROM BEEF PACKING EFFLUENT,

Colorado State Univ., Fort Collins.
J. C. Ward, W. Adams, and H. C. Isaksen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-224362, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-112, August, 1981. 4 p, 2 Tab.

Descriptors: *Wastewater treatment, *Meat processing industry, Physicochemical treatment, *Waste recovery, *Proteins, Industrial wastewater, Biochemical oxygen demand, Suspended solids, Grease, *Cost analysis, *Protein recovery.

The wastewater from a large beef packing plant, containing 3,000 mg/l BOD5 and 2,500 mg/l of suspended solids was treated in a physicochemical process that recovers protein. This process removed 58% of the total nitrogen, 80% of the oxygen demand and suspended solids, and 94% of the fat, oil and grease. The discharge of BOD5 was reduced to less than 3 pounds per head of beef slaughtered. For every pound of BOD5 entering the wastewater treatment plant, 0.77 pounds of product was recovered with a composition of 38% protein, 11% grease and oil, 27% inorganic solids, and 24% other solids (dry weight basis). About 2 pounds of protein were recovered per head. Total cost was $3 per 1,000 gallons (44% capital costs). A price of 42 cents per pound of protein would pay all costs. The figures given above were observed in a full scale plant and should not change significantly with different size wastewater treatment plants. This wastewater treatment process can be used as a pretreatment process for beef packing effluent prior to discharge to a sewage treatment plant. (Moore-SRC)

GROUP TREATMENT EVALUATION FOR METAL FINISHERS,

Centec Corp., Reston, VA.
E. Comfort, D. Harrison, and D. Sherman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-232506, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-143, September, 1981. 2 p, 2 Tab.

Descriptors: *Metal-finishing wastes, *Wastewater treatment, *Economic aspects, *Sewers, Regulations, Industrial wastes, Financing, Cost analysis.

Group treatment is one alternative for firms faced with the problem of compliance with pretreatment regulations. A preliminary study of the concept as applied to the plating firms within Huntington Industrial Park, Providence, Rhode Island, was conducted. Each potential participant was surved and wastewater sampled. Results were entered into a joint treatment model used to size the Group Treatment Facility. It was found that, with the assumed 10 participating firms, substantial savings could be realized. Installation of an industrial sewer system within the park, while more than doubling the demands for initial capital, would be cost-effective in the long run. The capital required was estimated at $300,000 to $500,000. The SPA Pollution Control Financing Guarantee Program was shown to be very attractive for such amounts, particularly when combined with an issue of tax-exempt bonds. Relatively small additional investment would allow process capacities to be increased so that the same facility could accept similar wastes from some of the very small job shops in the region, those which otherwise would be most severely impacted by pretreatment regulations. NITROGEN AND PHOSPHORUS REACTIONS IN OVERLAND FLOW OF WASTEWATER,

Louisiana State Univ., Baton Rouge. Lab. for Wetland Soils and Sediments.
R. A. Khalid, I. C. R. Holford, M. N. Mixon, and W. H. Patrick, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-239311, Price codes: A09 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-150, September, 1981. 6 p, 6 Fig, 1 Tab.

Descriptors: *Overland flow, *Wastewater treatment, *Phosphorus removal, *Nitrogen removal, Soil chemistry, Municipal wastewater, Land disposal, Model studies, Nitrification, Flooding, Vegetation effects.

Biochemical transformations of labelled ammonium-nitrogen resulting from the overland flow treatment of simulated wastewater were studied in small scale test models established with vegetated soils. Water movement in the system was primarily

controlled by the application rate the friction slope, the slope angle, the hydraulic characteristics of soils, and the evapotranspiration. Aerobic-anaerobic zones in the soil mass facilitate nitrification denitrification processes and enhance nitrogen losses to the atmosphere. The incomplete nitrification of ammonium nitrogen in the simulated wastewater applied to overland flow models suggests that nitrification reactions may be limiting the proportion of nitrate-nitrogen available for denitrification reactions. The loss of applied ammonium-nitrogen attributed to denitrification reactions ranged from 3 to 35%. The plant uptake of nitrogen in the overland flow and growth chamber studies accounted for 23 to 62% of applied ammonium-nitrogen. The results of laboratory studies indicated that initial flooding of aerated soil for about three weeks was accompanied by a large increase in phosphorus sorption capacity and decrease in phosphorus mobility. Longer periods of flooding caused a marked decrease in phosphorus sorption capacity and a corresponding increase in phosphorus mobility and leaching losses in acid soils. Calcium phosphate precipitation under alkaline soil conditions increased phosphorus sorption capacity of soils. The results of the overland flow experiment also demonstrated that the efficiency of phosphorus removal from municipal wastewater was greatly enhanced by lime addition to the soil compared to nonlimed flooded soil. FATE OF TOXIC AND NONCONVENTIONAL POLLUTANTS IN WASTEWATER TREATMENT SYSTEMS WITHIN THE PULP, PAPER, AND PAPERBOARD INDUSTRY,

Jordan (Edward C.) Co., Inc., Portland, ME.
B. K. Wallin, and A. J. Condren.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-247405, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-158, September, 1981. 4 p, 2 Tab.

Descriptors: *Pulp and paper industry, *Industrial wastewaters, *Wastewater treatment, *Sludge, Pollutants, Air pollution, Organic compounds, Wastewater analysis, Biological wastewater treatment.

A sampling and analysis program was conducted at two deink mills and a groundwood fine papers mill. Each mill employed a wastewater treatment system which included primary clarification, high rate biological treatment, secondary clarification, and combined primary/secondary sludge dewatering. An attempt was made to complete a mass balance of the pollutants under study through a sampling program including primary clarifier influent, biological treatment effluent, air emissions above the aeration tanks, and dewatered sludge solids. In general, 50% of the mass of each pollutant found in the mill's raw wastewaters were accounted for in the program. The accountability of the volatile organic pollutants ranged from 27 to 55%. The accountability of semivolatile pollutants ranged from 6 to 933% with three pollutants accounted for in excess of 100%. The objective of accountability was not achieved due to several factors, including: biochemical transformation; quantity of pollutants, detection limits, sample matrix, and analytical procedures; sampling procedures; and capability to accurately estimate air and sludge emissions. It is unrealistic to anticipate 100% accountability; however, through more controlled conditions, more advanced sampling techniques, and higher resolution analytical techniques, improved accountability should be a realistic goal. (Moore-SRC)

NICKEL RECOVERY FROM ELECTROPLATING RINSEWATERS BY ELECTRODIALYSIS,

Chemical Recovery Systems, Hanover, MA.
J. L. Eisenmann.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-227209, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-130, October, 1981. 4 p, 2 Fig, 1 Tab.

Descriptors: *Metal-finishing wastes, *Electrodialysis, *Wastewater treatment, *Industrial wastewater, Cost analysis, Water use, Nickel, Waste recovery, Recycling.

A program to demonstrate the feasibility of metal salt recovery and pollution control on a Watts-type nickel plating line by electrodialysis was conducted at Risdon Manufacturing Co., Waterbury, Connecticut. Each of two reclaim rinse tanks was treated by recirculating the rinse solutions through separate electrodialysis stacks. The first rinse solution was maintained at 2-5 g/1 nickel and the second rinse held at 0.3-0.4 g/1 nickel over several months of plating operations. The nickel salts recovered from the rinse solutions were concentrated 20-fold by the electrodialysis treatment and could be returned directly to the plate tanks for reuse. The process is capable of reducing nickel content in plating line effluents to the ppm range, can recover 95% of the nickel salts lost with conventional rinsing techniques and substantially reduce other raw material usage, and can minimize the effort and space required for operation of standard destruct equipment. For plating operations similar to the demonstration line yearly savings are estimated to be at least $16,000 in raw materials with a concomitant decrease of about 2,300 kg in sludge from pollution control facilities. Net cost savings should increase as chemicals become more expensive and pollution regulations more stringent. Depending on the operation of the plating line, additional savings may be realized on water usage, storing and handling of chemicals, improved rinsing, and additive recovery. (Moore-SRC)

5E. Ultimate Disposal Of Wastes

ONTARIO'S SEVEN-POINT PLAN FOR THE TREATMENT AND DISPOSAL OF INDUSTRIAL WASTE LIQUIDS AND SLUDGES,

J. Donnan.
Water and Pollution Control, Vol 118, No 7, p 28, 34, July, 1980.

Descriptors: *Wastewater treatment, *Effluents, Planning, Sludges, Ontario, Industrial wastes, Decision making, *Wastewater disposal.

As of November of 1979 three firms in Ontario were certified to deal with the disposal of organic wastes. Tricil operates an incinerator at Corunna which can burn about 15 million gallons annually. Frontenac Chemical Waste Services Ltd in Hamilton recovers oils and solvents as well as operating an experimental solidification facility. Woodington Systems Inc. operates an oil and water separation facility and landfills industrial sludges. No facilities exist in the province that are fully approved to accept all types of chemical wastes, although 23 landfill sites are able to accept specific kinds of organic and inorganic wastes. Thousands of liters of waste liquids and sludges each year find their way to landfills that are not specifically approved to handle them. Even so there are few reported instances of damages of any kind resulting from the improper disposal of these materials. A 'Seven-Point Program' has been devised for the treatment and disposal of industrial waste liquids and sludges. Included in these seven elements are: way-bill monitoring, classification of wastes, water disposal guidelines, regulations, perpetual care, transboundary movement of wastes, and facilities and site selection. However, the program has some drawbacks. The impact of the program cannot be reviewed, as the data has not been disclosed publically. No emphasis on incentives to waste generators to change their processes was included in the program. No explicit consideration was given to the costs to the participating firms of meeting the new changes. (Baker-FRC)

CURRENT POLICIES ON LAND APPLICATION,

N. Goldstein.
BioCycle, Vol 22, No 5, p 39-41, September/October, 1981.

Descriptors: *Land application, *Sludge disposal, *Political constraints, Philadelphia, New York, Political aspects, Ocean dumping, Composting, Water law, Water policy, Policy making, Legal aspects, Water pollution control.

Lack of firm policies for municipal sludge disposal results in confusion and waste in the waste treatment industry and municipal budgets. An example was seen in the City of New York, which developed a plan for sludge composting on sites within city limits. A complex court action involving the EPA and local officials, as well as public opposition, allowed continuation of ocean dumping of sludge past the December 31, 1981, deadline. As a result, Nassau County's new $15 million sludge dewatering plant, in the final stages of completion, will not be used in the foreseeable future. Hauing the sludge to the proposed dump site 106 miles offshore will cost $5-10 per wet ton, vs. $1.41 for the present 12 mile site. In contrast, Philadelphia dumped its last bargeload of sludge into the ocean on November 26, 1980. The city has begun a sludge utilization program, which involves land application near the city and in strip mined land 250 miles away. Trucks transport sludge to the dump sites and return filled with coal. In this case strict Region III EPA enforcement plus public support for land application gave Philadelphia the opportunity to develop a successful program. (Cassar-FRC)

THE STATUS OF NUCLEAR WASTE MANAGEMENT,

Argonne National Lab., IL.
J. H. Kittel.
Journal of Environmental Sciences, Vol 23, No 5, p 28-32, September/October, 1980. 9 Fig, 13 Ref.

Descriptors: *Radioactive wastes, *Nuclear engineering, *Toxicity, *Metals, *Fuel reprocessing, Nuclear reactors, Powerplants, Wastes, Waste storage, *Waste management, Waste characteristics, Liquid wastes, Plutonium, Plutonic water.

The status of nuclear waste management is discussed. High-level nuclear waste can be safely stored and isolated through a multiple barrier approach. Although it is a hazardous material, its toxicity diminishes rapidly. It then becomes less hazardous than other materials that are dealt with routinely. Detailed studies are needed regarding the geologic structures used as possible high-level waste repositories, especially studies of groundwater conditions. The geologic structure selected must either be free of groundwater or be one in which groundwater is moving very slowly and not into any aquifers from which drinking water might be obtained. Natural demonstrations of radioactive waste isolation exist at some groundwater-saturated ore deposits, and observations of these natural formations have been very encouraging with regard to the low migration of radioactive elements. Low-level waste has not attracted very much public attention. The technical strategy for disposal involves reducing the volume of the waste, packaging it in steel barrels, and storing the barrels in earth-covered trenches. 100 to 200 years of isolation are required. The management of uranium mill tailings is similar in many technical respects to the management of low-level wastes. (Titus-FRC)

BACTERICIDAL EFFECT OF SEAWATER CONTAINING DIGESTED NIGHT SOIL AND MARINE PLANKTON AGAINST INTESTINAL BACTERIA, (IN JAPANESE),

Yamanashi Univ., Kofu (Japan). Dept. of Environmental Engineering.
O. Nakayama, and M. Ohno.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 47, No 2, p 165-169, 1981. 3 Fig, 1 Tab, 14 Ref.

Descriptors: *Bacteria, *Ocean dumping, *Waste disposal, Plankton, Wastewater, Wastewater disposal, Enteric bacteria, Path of Pollutants, Bacterial analysis, Light intensity.

In order to estimate the sanitary problems of ocean fertilization with night soil, the effect of digested night soil, marine plankton and light on the viable count of intestinal bacteria in sea water was examined. One hundred ml each of aged seawater with or without digested night soil (1%), phytoplankton and zooplankton were inoculated with Escherichia coli, Salmonella typhimurium or Vibrio parahaemolyticus. The samples were then shaken with or without illumination for several days at 20 degrees C. The phytoplankton used included Nitzschia closterium, Phaeodactyllum tricornutum, Dunaliella tertiolecta, Brachiomonas sp., Chlamydomonas sp., Platymonas sp., Nannochloris sp., and Chlorella sp. The zooplankton was Tigriopus japonicus. Selective media were used each day to count the bacterial cells. E. coli and S. typhimurium survived more than 6 and 15 days, respectively, in dark, clean seawater, and V. haemolyticus propagated. In illuminated seawater containing digested night soil and marine plankton E. coli, S. typhimurium and V. haemolyticus died off within 1 to 3 days. (Baker-FRC).

FLUE GAS DESULFURIZATION SLUDGE DISPOSAL PRACTICES FOR COAL-FIRED STEAM AND POWER PLANTS,

Gibbs and Hill, Inc., New York.
H. A. Schlesinger.
Mining Engineering, Vol 32, No 10, p 1516-1520, October, 1980. 3 Fig, 10 Ref.

Descriptors: *Industrial wastes, *Waste disposal, *Sludge disposal, *Sludge treatment, Chemical wastes, Solid wastes, Sulfur, Fly ash, Landfills, Mine drainage, Regulations, Water quality control, Ponding, Lime, Limestone, Oxidation, Land disposal, Solid waste disposal.

Some of the alternatives for the handling and diposal of throw-away lime, limestone and dual alkali process solid wastes are discussed in view of the increasing number of sulfur emitting power plants that use lime or limestone as sulfur reducers. The advantages, disadvantages and economics of such methods as wet ponding without thickener, wet ponding with separate thickener, dewatering plus landfill, wet blending plus pipelining to disposal area, dry blending plus landfill, wet fixation plus pipelining to disposal area and mine disposal are considered. Plant size, the forced oxidation of sludge, and operating problems with sludge disposal are examined, along with sludge disposal regulations under the Resource Conservation and Recovery Act. It was concluded from the study that costs for sludge disposal are site specific. Some low cost disposal options include ponding and blending plus mine disposal and forced oxidation. Since deep mine disposal of some sludges may cause environmental problems of gas generation and impaired water quality, future land use should be considered when selecting the disposal site. The order of magnitude area requirement for a 3.5% sulfur, 14% ash, 27.9 MJ/kg coal, 30 year life, and 70% average capacity factory is about 40.5 sq dam/MW power or equivalent steam. The stabilization of scrubber sludge by fixation or blending is recommended to improve the properties and decrease leachability. (Geiger-FRC)

EVALUATION OF HIGH- AND LOW- SPEED CENTRIFUGES,

Water Pollution Control Plants, Philadelphia, PA.
W. Wankoff, T. Lauletta, and R. Shah.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1568-1573, November, 1981. 5 Tab.

Descriptors: *Centrifugation, *Dewatering, *Sludge drying, Sludge, Sludge disposal, Mechanical equipment, Philadelphia.

The development of sludge dewatering facilities in Philadelphia gave the water department experience in the design and operation facilities utilizing centrifuges. Presently, a low-speed/low-G machine is being used to dewater anaerobically digested primary sludge. Higher speed/higher-G machines are used to dewater a mixed 60%-primary/40%-secondary anaerobically digested material. The centrifuges have operated satisfactorily although there have been problems with peripheral equipment. When sludge dewatering is required on a continuous basis, there must be sufficient duplication within the system to permit down-time of equipment such as sludge grinding equipment, feed pumps, etc. (Small-FRC)

5F. Water Treatment and Quality Alteration

ENERGY MANAGEMENT IN THE WATER WORKS INDUSTRY,

Metcalf and Eddy, Inc., Boston, MA.
D. Brailey, and A. Jacobs.
Journal of the New England Water Works Association, Vol 94, No 3, p 216-239, September, 1980. 9 Fig, 8 Tab, 10 Ref.

Descriptors: *Water treatment, *Water treatment facilities, *Electric power costs, *Cost analysis, Utilities, Chemical treatment, Coagulation, Alum, Fuel, Energy, Water distribution, Water management, Electric power rates, Electric power demand, Operating costs.

Methods to optimize energy use in the treatment and distribution of water are explored. In general, 1200-1800 KWH of energy, usually in the form of electricity, per million gallons of water are required to drive motor operated pumps and equipment, to effectively acquire, treat, and distribute water. Rate structures vary among utility companies and usually combine a mixture of connection demand, reactive demand, standy, basic energy, time-of day, and fuel adjustment charges. A hypothetical electric rate schedule and utility were used to calculate the savings available from various electrical energy management measures. The utility serves a population of 75,000 with 10 MGD. The total estimated electricity usage of the facility is 450,000 KWH per month. Several ways to reduce the demand charge on the electric bill are listed. To reduce basic energy costs, several measures are recommended, such as using high-efficiency motors, improvement of pump efficiency, increasing system storage, reducing unaccounted for water, checking distribution system valves, and cleaning and lining pipes. The time of day charge effect may be optimized by running scheduled equipment during non-peak hours. The conservation of chemicals used in water treatment is illustrated in methods of coagulation control and alum recovery. (Geiger-FRC)

AQUIFER DECONTAMINATION FOR VOLATILE ORGANICS: A CASE HISTORY,

New Jersey Bureau of Ground Water Management.
W. F. Althoff, R. W. Cleary, and P. H. Roux.
Ground Water, Vol 19, No 5, p 495-504, September/October, 1981. 4 Fig, 2 Tab, 3 Ref.

Descriptors: *Chlorinated hydrocarbons, *Water pollution treatment, *Industrial wastes, Solvents, Plumes, Aquifers, *Groundwater pollution, Organic compounds, Trichloroethane, Tetrachloroethylene, Path of pollutants, Water pollution sources, Chemical wastes, Water quality control.

In December 1977 organic solvents, including 1,1,1-trichloroethane and tetrachloroethylene, were found in a municipal well in South Brunswick Township, New Jersey, at concentrations of 150-1500 ppb and 100-300 ppb, respectively. A hydrologic study determined that the source was an industrial plant. Under the plant site the Old Bridge aquifer was contaminated with as high as 40,000 ppb trichloroethane. Concentrations greater than 100 ppb extended 1000 ft downgradient of the plant. To protect a municipal well located 2500 ft from the plant, the industrial site was inspected and tanks, drains, sumps, etc., cleaned and repaired. A pollution abatement system with design rate of 198,000 gpd was installed. This consists of seven extraction wells, a treatment facility, two cooling towers in series to air strip volatile organics from the water, and two half acre, 10 ft deep infiltration ponds to return the water to the aquifer. During the 10 months of operation, there have been contaminant reductions of 87% and 93% in two of the decontamination wells, noticeable reductions in two other wells, and no improvement in three wells. The contamination plume has been substantially reduced in extent and concentration. The aquifer is expected to be decontaminated within several years, after which the treatment process will be discontinued. (Cassar-FRC)

CHEMICAL COAGULATION OF SURFACE WATER,

Johnson (C.C.) and Associates, Inc., Silver Spring, MD.
J. A. Susan, and R. M. Gruninger.
Industrial Water Engineering, Vol 18, No 4, p 14-18, July/August, 1981. 4 Tab, 2 Ref.

Descriptors: *Coagulation, *Chemical coagulation, *Surface water, Alum, *Water treatment, Polymers, Lakes, Ferric chloride, Magnesium carbonate.

This paper reviews some of the factors relating to chemical treatment of surface waters as experienced in field and laboratory studies at several water treatment plants processing Lake Erie and Lake Ontario water. In one plant an automatic coagulation control center closely regulates chemical dosages. In another facility plant scale tests with ferric chloride in place of alum produced finished water of similar quality, but caused higher Fe concentrations, more turbid water before filtration, rusty filter backwash water, difficulty in handling, and 20% higher cost. Alternative coagulants or coagulant aids suggested are magnesium carbonate (uneconomical for plants smaller than 20 mgd) and organic polymers. Sludge considerations include alum recovery (by sulfuric acid addition or solvent extraction), dewatering properties, and disposal. (Cassar-FRC)
W82-02623

METHOD AND APPARATUS FOR SUPPLYING DISSOLVED CHEMICALS INTO WATER,

Metallgesellschaft, A.G., Frankfurt am Main (Germany, F.R.). (Assignee).
K. Lohrberg, R. Pfohl, J. Schubert, M. Gritschke, and J. Freytag.
U.S. Patent No 4,230,569, 4 p, 1 Fig, 14 Ref; Official Gazette of the United States Patent Office, Vol 999, No 4, p 1538-1539, October 28, 1980.

Descriptors: *Patents, *Water treatment, *Industrial water, *Stream flow, Application equipment, Chemicals, *Dissolved solids, Horizontal flow.

An apparatus is provided for supplying dissolved chemicals into horizontally flowing streams of sea water or river water which are to be chlorinated for use as cooling water, e.g., for power plants. The apparatus comprises a horizontal conduit through which the water passes. A stationary manifold placed above the level of flowing liquid has vertical discharge hoses of differing lengths, each of which has an outlet opening below the level of the flowing water. The outlet openings are evenly distributed throughout the cross-section of the flowing water. The chemicals can be readily introduced into the aqueous streams with a particularly high degree of even distribution owing to the disposition of the discharge hoses which promote the distribution of the chemicals by oscillation. (Sinha-OEIS)

THE CLEAR LAKE EXAMPLE: AN ECOLOGICAL APPROACH TO PEST MANAGEMENT,

S. F. Cooke.
Environment, Vol 23, No 10, p 25-30, December, 1981. 1 Tab, 11 Ref.

Descriptors: *Midges, *Aquatic weed control, *Algal control, *Ecological effects, *Insecticides, Insect control, Lakes, Weed control, Biological magnification, Fish, Fish establishment, Fish populations, Pesticides, Larvicides, DDD, DDE, DDT, Parathion, Copper sulfate, Aquatic insects, Toxicity.

In efforts to control the populations of Chaoborus astictopus (termed gnats, although actually midges) and blue-green algae in Clear Lake, Lake County, California, ecological investigations were initiated in 1961. Prior to these studies, chemical control programs for C. astictopus using DDD, methyl parathion, and copper sulfate were tried but caused problems when the midges developed resistance to the chemical agents, and non-target species were affected by biomagnification of the pesticides through the food chain. In August of 1967, a few thousand Mississippi silverside fish (Menidia audens) were released into Clear Lake, and by 1969, they became the dominant fish in the lake. Also in 1969, a dramatic reduction in blue-green algae was noted over previous years. Gnat populations seemed to also be affected by the new fish in the lake, showing no signs of recovery to former densities even when chemical pesticide treatment of the lake was discontinued. No detrimental effects on sport fishing in Clear Lake have been observed since the introduction of M. audens, and the ecological approach to pest management in this case was regarded as successful. (Geiger-FRC)

NEW CONCEPTS IN FILTRATION PLANT DESIGN AND REHABILITATION,

Southern California Metropolitan Water District, Los Angeles.
A. E. Bowers, and J. D. Beard, II.
Journal of the American Water Works Association, Vol 73, No 9, p 457-463, September, 1981. 9 Fig, 12 Ref.

Descriptors: *Filtration, Water treatment, Coagulation, Control systems, Sedimentation, Backwash, *Water treatment facilities, Design criteria, *Southern California.

Changes in the Metropolitan Water District of Southern California's five water filtration plants (total 63,240 ML per day) have been both subtle and radical. All are presently of conventional design (coagulation, flocculation, sedimentation, dual-media filtration, and disinfection). Some of the modifications used in the District's plants are introduction of coagulants into the turbulent wake produced by an energy dissipation device, traveling bridges for sedimentation basin sludge removal, a single wash trough to collect used filter wash water, three-way valves in filter equipment, optimum design configuration for surface wash water jets, large storage tanks for preliminary settling and to buffer major fluctuations in raw water quality, and computer-based process control. (Cassar-FRC)

OZONE WATER TREATMENT,

S. Smith.
Water Well Journal, Vol 35, No 10, p 70-71, October, 1981. 1 Fig, 1 Tab.

Descriptors: *Ozonation, *Disinfection, *Water treatment, Ozone, Economic aspects, Construction costs, Operating costs, Chlorination, Costs, Well water.

Ozonation, used in over 1000 European and Asian cities as a primary water treatment, is not as common in North America: 20 plants in Canada and a handful in the U.S. Some advantages of ozonation are: (1) destruction of organic precursors of trihalomethanes, (2) destruction of hydrogen sulfide, (3) precipitation of dissolved Fe and some other metals, and (4) no chlorine taste. Ozonators are more expensive to construct and operate than chlorination systems, but are long-lasting, simpler to operate, and do not require chemicals. (Cassar-FRC)

RESTORING AN ANTIQUE WATER SYSTEM.

Water/Engineering and Management, Vol 128, No 10, p 31-32, 1981.

Descriptors: *Water distribution, *Water conveyance, Water supply, Pipes, Rehabilitation, Conveyance structures, Linings, *Burlington, *New Jersey, Water treatment, Water quality control, Iron, Manganese.

Iron and manganese content of water in the city of Burlington, New Jersey increased to levels which made the water unacceptable. The system serving the city was very old and repairs were difficult and costly. While sequestering was able to bring some relief to the situation, a study was conducted which yielded several conclusions. Treatment for iron and manganese removal was going to be necessary. The old water treatment plant could not treat the water without major modification and in all probability it would be less costly to construct a new plant. The old distribution system piping was probably contributing to the problem, but correcting it would have to be deferred until proper water treatment was provided. A major feasibility study was undertaken. The program devised called for construction of the new treatment plant, addition of elevated storage, and restoration of the very old water distribution system. Estimated cost of the entire project was between 10 and 15 million dollars. Cleaning and cement mortar lining of existing pipe was done to restore the pipe to like new condition with an estimated additional life in excess of 50 years. Two separate pipe rehabilitation contracts were involved. Elapsed time for the work was four years. The job was accomplished with a minimum of excavation, repaving and service interruption. WATER REGULATION IN AN INFLATIONARY ENVIRONMENT,

R. E. Hammond.
Journal of the New England Water Works Association, Vol 95, No 3, p 187-192, 1981.

Descriptors: *Planning, *Financial aspects, Water treatment, Water treatment facilities, Wastewater treatment, Drinking water, Financing, Costs, Case studies.

Various case histories are briefly cited which exemplify lack of proper financial consideration used in water supply problem solving steps. Cases involving meter reading, pH adjustment for water treatment processes, installation of a flash mixer, improper use of carbon filters, replacement tanks, and improperly conceived plant design are each considered. The general outcome of improper and incomplete planning is lack of public support and trust. The author stresses the need for a more complete understanding of the problems in any given area and a thorough investigation of proper solutions to the problems, including a thorough study of any monies needed to execute the plans and keep the system operable. (Baker-FRC)

A DYNAMIC PROGRAM FOR COAGULATION AND FILTRATION AT CHICAGO'S JARDINE WATER TREATMENT PLANT,

Illinois Inst. of Tech., Chicago.
A. E. Burgarino.
PhD Dissertation, 1980. 369 p, 52 Fig, 20 Tab, 114 Ref, 5 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-06292.

Descriptors: *Water treatment, *Water purification, *Coagulation, Statistical methods, Filtration, Automation, Turbidity, *Chicago, Jardine Water Purification Plant.

A computerized optimization program is developed for the Jardine Water Purification Plant at Chicago, Illinois. The purpose of the program is to calculate the required alum and polymer doses that not only yield an acceptable effluent turbidity, but also effect the lowest operating cost. The solution is complicated by the interaction of coagulation and filtration. There are two main perspectives. One is the systems approach of integrating the coagulation and filtration process by the solution framework of dynamic programming. The second is the development of a set of equations which predict (or simulate) turbidity removal and the rate of increase of filter headloss as functions of coagulant doses. These equations are used in the dynamic program to avoid a coagulant dose that results in an unacceptable filtered effluent turbidity or excessive headloss. It is shown how an optimization procedure based on statistical analysis of historic data can be used as part of a control algorithm for automated plant control. (Sinha-OEIS)

THE ROMAN WAY,

S. Lucas.
Water, No 40, p 13-15, September, 1981.

Descriptors: *Water quality management, *Sewer systems, *Water pollution prevention, Water quality control, Wastewater treatment, Water pollution control, *Water treatment, Water supply, Water resources development, Water supply development, Water management, *Rome, Future planning.

The city of Rome supplies 10% of its users with private connections to mostly nonpotable water sources. Azienda Comunale Electtricita' ed Acque (ACEA) is in charge of sterilizing water for users in Rome. Only small treatment plants are needed to remove hardness from water supplies from the Appenine Mountains. The Peschiera aqueduct supplies most of the water from the mountains. Long range plans include the building of a dam, a new aqueduct, and a sewerage system around Lake Bracciano to protect it as a water supply source. Metering systems help to curb water use, but plans are being implemented to phase out metering over the next 10 years. The consumers will soon be charged a nominal fee for sewage disposal. No general laws exist at present for sewage disposal. ACEA has been asked to organize district sewerage systems for outlying areas. The main purpose of these systems will be to protect water supplies. A plan is proposed to divide the Lazio region into three smaller sections to manage water pollution problems. The time needed for integration of water supply, sewage disposal and pollution control management will probably be extensive due to unstable conditions in the Italian government. (Geiger-FRC)

WATER SUPPLY AND SANITATION DECADE PROGRAMME,

National Environmental Engineering Research Inst., Nagpur (India).
B. B. Sundaresan, and S. T. Khare.
Aqua, No 5, p 16-18, 1981. 4 Fig, 2 Tab.

Descriptors: *Water supply development, *Sanitation, *India, Human diseases, Water scarcity, Water shortage, Administrative decisions, Decision making, International agreements, Financial aspects, Drinking water, Potable water.

Efforts underway in India to achieve the goal of the United Nations Water Conference of providing safe drinking water and effective sanitation for all people of the world during the decade 1981-1990 are cited. Awareness of the need to provide an adequate and wholesome water supply was recognized with the establishment of the Bhore Committee as early as 1944. A report from the Union Ministry of Health in 1964-65 indicated that about 66% of the Indian rural population lived in areas where it was easy to provide safe drinking water from local sources such as wells. The remaining

35% lived in villages where water scarcity was a way of life and in which engineering skills, extra financial outlays and time consuming work would be required to deliver proper water amounts. Comprehensive planning and large scale financial allocations were deemed necessary for implementation of water supply and sanitation programs at the state level. Administrative decisions and public support were lacking. The vast numbers of villages and people affected by various waterborne and water related diseases indicated the seriousness of the environmental health problem. Rapid assessment of the status of drinking water supply and sanitation in India was undertaken during 1977-80. In 1980 the government of India pledged support to the UN program. Almost all the equipment and materials required for water supply systems are currently available in India. Administration action has been initiated at various levels. Sufficient professionals are available to enable the work to proceed. (Baker-FRC)

PRACTICAL EXPERIENCES IN PLANTS USING ACTIVATED CARBON,

Gentofte Water Supply (Denmark).
P. K. Jensen.
Aqua, No 5, p 0321-0329, 1981. 13 Fig.

Descriptors: *Water treatment, *Activated carbon, Surface waters, Chlorination, Ozonation, Manganese, Organic matter, Algal growth, Eutrophication, Denmark, Filtration, *Lake Sjaelsoe, *Denmark.

Experience at a waterworks in Denmark is reviewed which led to the decision to use ozone plus activated carbon filtration as the last step in treatment of water from lake Sjaelsoe for drinking purposes. This plant is operational during March through November, with shutdown during winter when consumption is low, and to allow a complete overhaul. A seasonal bloom of algae occurs, which gives rise to taste and odor problems. Experiments to treat lakewater began in 1956 and included chemical treatment with sedimentation and filtration through rapid sand filters and ordinary slow sand filters. It was later discovered that blowing through with ozine before the filtration step gave additional improvement of taste and odor and gave the water a clear appearance as well. This treatment gave a solution to the problem of manganese removal from the lake water. While activated carbon filters are needed to provide acceptable taste and odor control, even if the water at the inlet to the activated carbon filters has a free chlorine content of about 1 mg/liter, there is a risk of bacterial growth across the filters. Post-chlorination has been instituted to obtain successful elimination of the organisms produced. In this case, where water production is based upon lake water for 15-25% of the total production, the economy of the situation is acceptable in relation to the influence on the cost price and the price which consumers must pay. BACTERIA FROM A SUSPENDED GROWTH SYSTEM AS ORGANIC PRECURSORS TO THE FORMATION OF TRIHALOMETHANES,

Missouri Univ-Rolla. Dept. of Civil Engineering.
F. Dolan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168519, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, 1981. 71 p, 12 Fig, 8 Tab, 31 Ref. OWRT- A-116-MO(2), 14-34-0001-0127.

Descriptors: *Bacteria, Ferric iron, *Chlorine, Chloroform production, *Water treatment, *Trihalomethanes, *Organic precursors, *Bacterial physiology.

The objective of this research was to study the bacteria from a suspended growth system as organic precursors to the formation of THMs. THM production was monitored as a function of initial chlorine dose and the concentration of bacterial mass as measured by turbidity. All tests were conducted on a batch basis. Ferric iron was also examined for its potential to act as a catalyst for THM production during the chlorination of bacterial cells. In a system saturated with chlorine, chloroform formation was found to increase linearly with the amount of cell mass used as an organic precursor. Chloroform production was also found to increase in relation to a greater exposure of cell surface area (e.g. dispersed cells vs. flocculated cells). Ferric iron appeared to catalyze chlorination reactions in water, causing increased chlorine consumption, but did not increase THM production.

NEW ANTIMICROBIAL AGENTS FOR TREATMENT OF WATER,

Auburn Univ., AL. Dept. of Chemistry.
S. D. Worley, H. H. Kohl, and W. B. Wheatley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168535, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, November 30, 1981. 10 p. OWRT-A-072-ALA(1), 14-34-0001-1101.

Descriptors: *Bactericides, *Disinfectants, *Water treatment, Water supply.

Several N-chloramine agents have been tested for their efficacy as bactericides in water. The compound 3-chloro-4,4-dimethyl-2-oxazolidinone (agent I) has proved to be the best of those tested, and in fact, definitely holds promise as an all-purpose water disinfectant for swimming pools, cooling towers, wells, military field units, the poultry industry, hospitals, and possibly even municipal water-treatment plants. It has been shown to be effective against a broad vicinity of bacteria and in a laboratory water treatment plant. It is a solid with appreciable solubility in water which retains its chlorine content in a demand-free situation almost indefinitely. It is stable in dry storage and in water solution, and it releases chlorine as necessary to kill bacteria upon demand. Preliminary tests indicate that it will not be toxic toward animal life. Furthermore, it should not cause the formation of toxic haloforms in water containing organic material.

THE DEVELOPMENT OF A VILLAGE WATER SUPPLY SYSTEM ON TRUK,

Guam Univ., Agana. Water and Energy Research Inst.
S. J. Winter, and R. A. Stephenson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168618, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No 28, 1981. 45 p, 27 Fig, 1 Tab, 4 Ref, Append. OWRT-B-003-GUAM(1), 14-34-0001-0261.

Descriptors: Water conveyance, *Developing countries, *Water supply development, *Water treatment, Wastewater treatment, Wastewater disposal, Public health, Potable water, Micronesia, *Truk, Caroline Islands.

The islands of Micronesia encompass only a little more than 1,000 square miles of land area in an arc lying across the face of the northwest and central Pacific. At present, the centralized water supply and wastewater treatment and disposal systems are located primarily in the various district centers. Most households in Micronesia obtain their fresh water from streams, springs, and household rainwater catchment systems. Toilet wastes are generally disposed of by means of privys over shallow shore waters, streams, or pits dug in the ground. Diseases associated with poor sanitary conditions are common. The objectives of this project are to improve the water utilization scheme of a typical Micronesian village in a manner that provides minimal disruption of normal cultural practices and to train Micronesians in these improvement procedures.

THE COST OF QUALITY,

Yorkshire Water Authority (England).
P. G. Clark.
Water, No 40, p 2-5, September, 1981. 4 Fig.

Descriptors: *Water supply, *Sewers, *Rivers, *Pipes, *Water quality, Potable water, Disinfection, Leakage, Networks, water loss, Distribution, Dams, *Water treatment, Filtration, Flow, Channels, Costs.

The Yorkshire Water Authority has reduced its annual capital expenditures since 1974. The reductions were a result of reorganization, customer demands, and the regional economic climate. Due to the cutbacks in spending, the Water Authority has adopted a maintenance policy which responds only to the most severe problems on an ad hoc basis. Projections of future maintenance problems and costs have been prepared. These include repairs to dams and service reservoirs, upgrading water quality, and replacing unlined cast iron pipes. EVALUATING A PLANT'S POTENTIAL FOR UPGRADING,

Freese and Nichols, Inc., Austin, TX.
A. J. Huckabee, and J. T. Garrett, Jr.
Journal of the American Water Works Association, Vol 73, No 9, p 478-483, September, 1981.

Descriptors: *Water treatment facilities, *Design criteria, Systems engineering, Alternative planning, Planning, Hydraulic equipment, Construction.

A three-phase method is suggested to evaluate the feasibility of upgrading an existing water treatment plant. In Phase 1, documentation, all available physical data on the plant are collected and facilities inspected to gather any missing information. Phase 2, analysis, is concerned with treatment effectiveness, capacities, and serviceability of the following: raw water intake, low-lift pumps, flow splitting and distribution, rapid mix equipment, flow distribution, flocculation basins, settling basins, settled water collection, transport to filters, filter boxes and media, piping systems, and backwash system. Phase 3, synthesis, proposes several plant layout alternatives. The most cost effective proposal is selected, presented to the client, and described in a final report. (Cassar-FRC)

ADSORPTION OF DISSOLVED ORGANICS IN LAKE WATER BY ALUMINUM OXIDE. EFFECT OF MOLECULAR WEIGHT,

Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
J. A. Davis, and R. Gloor.
Environmental Science and Technology, Vol 15, No 10, p 1223-1229, October, 1981. 8 Fig, 57 Ref.

Descriptors: *Adsorption, *Water treatment, *Organic compounds, *Lakes, *Aluminum oxide, Disinfectants, Chlorine, Organic carbon, Suspended solids, Hydrogen ion concentration, Separation techniques, Electrophoresis, Drinking water, Chromatography, Dissolved solids, Geochemistry.

The role of adsorption in the geochemical cycle of organic carbon in lacustrine environments and the binding of polar organic compounds at the oxide surface were studied in laboratory experiments with water samples from Lake Greifensee, Switzerland. Dissolved organic compounds were fractionated by gel exclusion chromatography into three molecular size classes. The adsorption of each fraction onto colloidal alumina was studied as a function of pH. Low molecular weight compounds were weakly absorbed, while organic compounds with molecular weights over 1000 formed strong complexes with the alumina surface. Measurements of electrophoretic mobility showed that alumina particles suspended in the original lake water had high negative charges due to adsorbed organic matter with molecular weights usually in the range of 1000 to 3000. During alum coagulation in the treatment of drinking water, the preferential removal of trihalomethane precursors may be caused by the adsorption of the high molecular weight organic compounds. Adsorption may also

affect the molecular-weight distribution of dissolved organic material in lakes. (Geiger-FRC)

THE EQUILIBRIUM FLUORIDE CAPACITY OF ACTIVATED ALUMINA,

Houston Univ. at Texas.
G. Singh, and D. A. Clifford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124075, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-082, July, 1981. 5 p, 5 Fig, 2 Tab.

Descriptors: *Water treatment, *Fluoride, *Activated alumina, *Adsorption, Ionic interference, Equilibrium, Hydrogen ion concentration, Municipal water.

Current estimates are that there are several thousand public water supplies in the U.S. with excessive fluorides, especially in the 1.4 to 5.0 mg/l range. Many of these communities may eventually install activated alumina treatment systems to remove the excess fluoride. Because design limitations for a defluoridation process were unavailable, laboratory studies were performed to establish the maximum (equilibrium) fluoride capacities for activated alumina as a function of pH and competing ions. Fluoride adsorption tests were run using mini-columns containing 1g of acid-treated Alcoa F-1 activated alumina equilibrated for 6 to 10 days with a continuous flow of fluoride solution at a constant pH. Maximum fluoride adsorption capacities in distilled water solutions of sodium fluoride were found to be 8000 g F/cu m at 3.0 mg F/L and 9100 F/cu m at 6.0 mg F/L. The optimum pH range for fluoride adsorption was 5 to 6. Less than 50% of these capacities are estimated to be attainable in actual municipal defluoridation practice because of poor kinetics and competing ion effects. Fluoride capacities were not significantly reduced by competition from chloride or bicarbonate; however, at a typical sulfate concentration (250 mg/L) the fluoride adsorption capacity was reduced 28% at pH 6. It was observed that as pH increased from 6 to 8, the rate of fluoride adsorption also increased. (Moore-SRC)

INORGANIC CONTAMINANT REMOVAL FROM DRINKING WATER BY REVERSE OSMOSIS,

Charlotte Harbor Water Association, Inc., Harbour Heights, FL.
M. R. Huxstep.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-224420, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-115, October, 1981. 2 p, 1 Tab.

Descriptors: *Water treatment, *Reverse osmosis, *Fluoride, *Nitrate, *Arsenic, Hardness, Groundwater, Dissolved solids, Calcium, Magnesium, Chloride, Sodium, Sulfate, Inorganic contaminants.

The removal of inorganic contaminants from drinking water was studied using two reverse osmosis (RO) treatment systems. A high pressure (400 psi) and low pressure system (200 psi), each having a rated capacity of 1.82 L/sec (28.9 gpm) of product water, were used to evaluate their capability for removing various inorganic contaminants. A groundwater was spiked with varying concentrations of fluoride, nitrate, arsenic III, and arsenic V, and runs of 2 to 5 days were conducted to determine rejections. Removal data were also collected on the natural constituents in the feed water of total dissolved solids, hardness, calcium, magnesium, chloride, sodium, and sulfate. For all contaminants and natural constituents measured, the high pressure system operated at 265 to 359 psig more effectively removed the inorganic contaminants than did the low pressure system operated at 163 to 187 psig. High pressure system removals ranged from 80 to 99%; low pressure, from 10 to 85%. Percent removals varied with the ion measured, but the order, from best to worst, was about the same for each system. The order for the high pressure system was: (1) arsenic V, (2) fluoride, (3) arsenic III, and (4) nitrate. Percent removal was also independent of the initial concentration.

REMOVING TRACE ORGANICS FROM DRINKING WATER USING ACTIVATED CARBON AND POLYMERIC ADSORBENTS,

Iowa State Univ., Ames.
C. S. Oulman, V. L. Snoeyink, J. T. O'Connor, and M. J. Taras.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119768, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S2-81-077,078,079, 53 p, July, 1981. 5 p, 1 Tab.

Descriptors: *Adsorbents, *Activated carbon, *Drinking water, *Trihalomethanes, *Chloroform, Fulvic acids, Humic acids, Resins, Organic carbon, Water treatment, Chlorinated hydrocarbons, Halogenated hydrocarbons.

Adsorption isotherms and bench-scale column studies were used to compare the performance of five types of commercially available activated carbons and four types of resins for removing humic acids, fulvic acids, 2-methylisoborneol (MIB), and chloroform from water. For adsorbing humic materials, some of the activated carbons and the weak base phenol-formaldehyde resins performed satisfactorily. The same activated carbons provided satisfactory removal of MIB, although the capacity was reduced somewhat in the presence of humic acid. The carbonaceous resin and one of the activated carbons had about the same capacity for chloroform removal at concentrations under 0.5 mg/l. The presence of 10 mg/l of humic acid had little effect on their capacity for adsorbing chloroform. In studies using pilot plant adsorption columns to adsorb halogenated organic substances from softened, filtered Kansas City water, activated carbon and carbonaceous resin were able to remove trihalomethanes (TTHM) for extended periods. Conversely, strong and weak-base anion exchange resins were not able to remove the TTHM. Only the granular activated carbons were effective in removing significant amounts of the total organic carbon (TOC) present. Periodic steaming of the activated carbon columns reduced bacterial growth and enhanced TTHM and TOC removal. Regular backwashing of the activated carbon columns was also effective in reducing the accumulation of bacterial growth. (Moore-SRC)

CROPLAND, BUFFER, AND STREAM: A CASE STUDY IN AGRICULTURAL NONPOINT SOURCE WATER POLLUTION,

Michigan State University, Department of Agricultural Engineering.
G. H. Aull, III.
PhD Dissertation, 1980. 235 p, 100 Fig, 19 Tab, 48 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-01076.

Descriptors: *Water pollution control, *Water quality control, *Agricultural runoff, Agricultural engineering, *Nonpoint pollution sources, Vegetation, Buffer areas, Filter areas, *Michigan.

Agricultural cropland runoff, a type of nonpoint source water pollution, can degrade the quality of surface waters. Several related programs are directed at reducing nonpoint source water quality problems. One of the newer practices is the streamside grassed buffer or filter strip. A field-scale research project utilizing a vegetated filter area was planned. The three-year study began in January 1978. This dissertation presents conclusions concerning the vegetated buffer area based on one year of data collection and six major runoff occurrences. Statistically significant differences in water quality constituent concentrations and loads were measured in the runoff from the control and buffered fields. The data indicate that the vegetated buffer area reduced common agricultural water polluted (nutrients, sediment, and oxygen demand) in the cropland runoff by about 25%. The runoff flows were found to have a fairly substantial impact on stream pollutant loads and a lesser, though quite variable, impact on stream pollutant concentrations. The water quality of the stream was marginal, though very few water quality standards violations were noted. The viability of the practice is best determined by personal values associated with such a pollutant reduction, when compared to the cost. The potential exists for reducing these costs through farmer design and/or installation of vegetated buffer areas, though the impact of such on pollutant reduction is unknown. (Sinha-OEIS)

SOUTH AUSTRALIA'S APPROACH TO SALINITY MANAGEMENT IN THE RIVER MURRAY,

South Australia Engineering and Water Supply Dept., Adelaide.
K. J. Shepherd.
Agricultural Water Management, Vol 4, No 1/3, p 335-352, 1981. 5 Fig, 8 Ref.

Descriptors: *Salinity, *Water quality management, Rivers, *River Murray, *Australia, Cropland, Irrigation practices, Groundwater, Groundwater pollution, Water pollution sources, Farming, Water quality, *Saline water intrusion.

The three River Murray States and the Commonwealth of South Australia have developed a coordinated program for controlling drainage and salinity problems in South Australia. This area of Australia receives less than 8 inches of rainfall a year, which means that no local river can be relied upon for substantial water supplies. The River Murray is the area's most reliable and important water resource. The most immediate threat to water quality in the river is salinity. Much of the groundwater in the area has a high salinity level, which passes to the river, which in turn increases in salinity levels as it passes downstream. Salinity enters the Murray River from the natural inflow of groundwater, from river structures such as locks and weirs, and from irrigation practices. High salinity levels increase the hardness of water supplied to domestic users, limit the types of crops which can be grown by the farmers, and cause corrosion, scale and poor steam quality for industrial water users. The South Australia salinity control program calls for the establishment of the Noora Drainage Disposal Scheme, which involves the pumping of irrigation drainage water from existing evaporation basins at Berri and Renmark to an out

of the valley basin some 20 km east of Loxton. Upgrading control works on existing evaporation basins, the Rufus River Interception Scheme, replacement of furrow irrigation with improved irrigation methods, technical support for conversion of overhead to undertree irrigation and the installation of adequate drainage, and advances on monthly entitlements which are used for dilution are all part of the program to decrease the salinity problem. FRENCH EXPERIENCE IN WATER POLLUTION CONTROL,

Compagnie Generale des Eaux, Paris (France).
P-L. Girardot.
Aqua, No 2, p 7-10, 1981. 12 Fig.

Descriptors: *Water pollution control, *Planning, *France, Water quality, *Watercourses, Administrative decisions, Management, Governmental interrelations.

A strong policy has been enforced in France over the past 15 years in efforts to restore watercourses. One of the major areas of effort has been in developing measures against pollution. The River Basin Financial Agency has been established, and the water policy within the Ministry of the Environment has been reorganized. The results obtained by the largest river basin financial agency, the Seine-Normandie basin, are good examples of the work of these agencies. Programs for dams, reservoirs, implementation of quality objectives, financial incentives compelling polluters to pay considerable taxes, and improvement of treatment facilities have all been areas of endeavor by these agencies. An essential complement of these administrative actions is the development of techniques enabling reduction of the pollutant load. The security of the water supply has been improved by setting up extensive networks of cross connections between treatment plants, relocation of water intakes and construction of storage basins. Through the establishment of these various administrative agencies and through the development of acceptable techniques, means for control of the pollution situation will become apparent. Continuous control of raw water quality and early detection of occasional pollution are the only effective means. Continuously operating stations have been set up in the Paris area to monitor water quality and detect the arrival of occasional pollution. A plan known as Seine Security has been devised whereby activation of all means of immediate reaction to a pollution problem will occur as soon as an alarm is set off. (Baker-FRC)

Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168527, Price codes: A04 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Virginia Polytechnic Institute and State University Bulletin 134, August, 1981. 61 p, 5 Fig, 14 Tab, 42 Ref. OWRT-A-085-VA(2).

Descriptors: *Nonpoint pollution control, Planning, Cost distribution, Benefit distribution, Water quality, *Nonpoint pollution sources, *Water pollution control, *Cost allocation, *Occoquan Basin, Fairfax County, Virginia.

In areas designated as having complex water quality problems, the challenge for 208 planning is to develop nonpoint pollution control strategies that are acceptable to the affected political jurisdictions and interest groups. This study's thesis is that acceptance of a nonpoint pollution control strategy by an individual jurisdiction requires the expectation of receiving positive net benefits. The overall objective of this research, therefore, was to investigate how local compensation payments can be used to encourage acceptance of nonpoint pollution control strategies to ensure that no jurisdiction incurs costs in excess of benefits. Using a linear programming (LP) framework that allows the integration of physical, economic, and political aspects of pollution control policy, the report uses Northern Virginia's Occoquan Basin as a case study to illustrate the potential of distributional factors in discouraging acceptance of pollution control strategies that maximize net benefits. Also illustrated within the LP framework is the cost of encouraging acceptance of strategies by allocating nonpoint control according to other criteria. The findings of the research should encourage planners and researchers to consider explicitly the distributional impediments to successful implementation of nonpoint pollution control. The report calls for the development of regional water quality management agencies with authority to raise revenues and offer compensation payments.

EFFECTS OF WHOLE LAKE MIXING ON WATER QUALITY AND PHYTOPLANKTON,

Oklahoma State Univ., Stillwater. School of Biological Sciences.
D. W. Toetz.
Water Research, Vol 15, No 10, p 1205-1210, October, 1981. 7 Fig, 2 Tab, 19 Ref. OWRT-A-078-OKLA(2).

Descriptors: *Water quality management, *Phytoplankton, *Lakes, Mixing, Artificial mixing, Destratification, Dissolved oxygen, *Oklahoma, Biomass, Manganese, Chlorophyll A, Turbidity, Algal growth.

The effects of artificially mixing two Oklahoma lakes for two seasons or more are described. The lakes were mixed with a downflow pump, and changes in water quality and algal biomass were monitored. During 1976, prior to any pumping, the depth of the thermocline in Arbuckle Lake gradually increased during the course of the summer. Artificial pumping during 1977 and 1978 increased the rate at which the depth of the thermocline increased. Pumping advanced turnover of the lake in the autumn of 1977. The thermal profile revealed deeper stratification than had been revealed prior to mixing, but also strong mixing below 10 meters. The volume of the lake containing 1 mg/liter dissolved oxygen or above also increased during the years of mixing; the increase was probably the result of mechanical pumping. The most significant effect of the pump was to decrease ammonia in the epilimnion and hydrogen sulfide in the hypolimnion. In all years the flora was dominated by diatoms, blue-green algae, green algae, and flagellates. The second lake, Ham's Lake, remained destratified due to the pumping, but seldom produced completely isothermal conditions or isochemical concentrations of disslved oxygen. There was no drastic change in other water quality parameters. However, artificial mixing decreased water clarity and increased algal biomass by a factor of about 2.5, probably by reducing sinking rates of the phytoplankton. Artificial mixing apparently eliminated a fall pulse of Microcystis. (Baker-FRC)

UNSTEADY WATER QUALITY MODEL FOR RIVER NETWORK,

Instituto de Pesquisas Hydraulicas, Porto Alegre (Brazil).
C. E. M. Tucci, and Y. H. Chen.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 477-493, October, 1981. 9 Fig, 1 Tab, 10 Ref.

Descriptors: *Model studies, *Water quality management, *Mathematical studies, *River systems, Water quality, Water quality control, Water pollution, Oil industry, Industrial wastes, Mathematical equations, Hydraulic models, Decision making.

A mathematical model designed to predict water quality for a river network under unsteady flow conditions was applied to the Jacui Delta in Brazil. Two of the four rivers feeding the delta are highly polluted, and a third river, receiving the wastes of a petrochemical complex, is in danger of becoming polluted in a few years. Available hydraulic data was used to calibrate the hydraulic part of the model. The model was limited in handling one-dimensional assumptions, but good in handling large river systems at minimal computer costs. The data input can be easily applied to other river systems, while the computer program, which is in modular form, can be easily modified to study other water quality variables. Other researchers have used the hydraulic part of the model with a sediment continuity expression to study water and sediment related problems. Where possible, a model should be calibrated to simulate field conditions. However, where field data is not available, models based on sound physical processes may still be used to evaluate responses of a system to changes and aid in decision making. (Geiger-FRC)

ON THE ROLE OF UNDERWATER PARKS AND SANCTUARIES IN THE MANAGEMENT OF COASTAL RESOURCES IN THE SOUTHEASTERN UNITED STATES,

National Park Service, Homestead, FL.
G. E. Davis.
Environmental Conservation, Vol 8, No 1, p 67-70, Spring, 1981. 1 Fig, 1 Tab, 25 Ref.

Descriptors: *Parks, *Underwater, *Coastal zone management, *Coastal waters, Environmental effects, Ecological effects, Commercial fishing, Sport fishing, Consumptive use, Estuaries, Everglades, *Southeastern United States.

The seven underwater parks or sanctuaries in Florida and the US Virgin Islands exhibit wide variations in the degree of protection of aquatic resources. Protection ranges from almost complete protection in the first parks established to almost no protection in the most recently established parks. Coral reef ecosystems are dynamic and change dramatically in response to natural short-term environmental variations such as unusually low temperatures. Fisheries harvests may reduce the size at which exploited species mature, and reduce the amount and variability of genetic material produced by exploited populations. The consequences of permitting consumptive uses of aquatic resources in parks and preserves need to be evaluated. Natural areas must be protected to serve as standards which will allow distinctions to be drawn between effects of exploitation or pollution and normal variation. Unless consumptive uses are severely limited, the primary values of parks and reserves may not be realized. (Small-FRC)

COMPARISON OF STATISTICAL PHOSPHORUS-RETENTION MODELS,

National Board of Waters, Helsinki (Finland).
T. Frisk, J. S. Niemi, and K. A. I. Kinnunen.
Ecological Modelling, Vol 12, No 1, p 11-27, March, 1981. 2 Fig, 9 Tab, 24 Ref.

Descriptors: *Phosphorus, *Water quality management, *Statistical models, *Decision making, *Lakes, Nutrients, Water quality control, Model studies, Mathematical models, Mathematical studies, Statistical methods, Planning, Management planning, Eutrophication, Eutrophic lakes, Water pollution control.

Statistical phosphorus-retention models may be used in water quality management programs for predicting the average phosphorus levels of a lake. The suitability of a model may be evaluated by comparisons with experimental reference data. Two sets of previously recorded data, one from Lake Paijanne, the other from 85 global lakes, were used in a number of statistical phosphorus-retention models described in the literature. Accessory models were generated from the original models by parameter estimation. Results showed that phosphorus-retention models are not general enough to be accurately applied to any desired lake. The range of these models which should be considered depends upon the relationship between the phosphorus concentration of the outflowing water and the total phosphorus input/volume of lake water. In very eutrophic lakes, where the phosphorus concentration of the outflowing water is over 40 milligrams/cu m, application of the models does not give reliable results. Application of phosphorus-retention models to the estimation of the phosphorus loading capacity of a lake is also considered. (Geiger-FRC)

THE COMBINATION OF INPUT-OUTPUT ANALYSIS AND LINEAR PROGRAMMING FOR WATER RESOURCE MANAGEMENT: AN APPLICATION TO NORTHWEST IOWA,
Iowa State Univ., Ames. Dept. of Economics.
J. J. Rhee.
PhD Dissertation, 1980. 180 p, 5 Fig, 26 Tab, 86 Ref, Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-12981.

Descriptors: *Model studies, *Economic aspects, *Water resources development, Linear programming, Systems analysis, Management planning, Water users, Irrigation, Iowa.

The first objective of this study sought to develop an analytical framework integrating both competitive and interdependent dimensions of resource uses. To achieve this objective, a linear programming model that consists of an input-output system and resource constraints, was formulated. The second objective was to apply the model to Northwest Iowa. Because of the difficulty in predicting the future of irrigation in Northwest Iowa, despite an expectation of a substantial increase in irrigation, some upper limits to irrigation were established in terms of land and water availability for irrigation. The results of the application show that the level of final demands that can be achieved subject to the water supply constraints of Northwest Iowa coincided with the target level of final demands that was imposed in the model, implying that the available water supplies of Northwest Iowa do not constitute a limiting factor to achieving the target level of final demands which was based on income and population growth projected for the region to the year 2020. It was concluded that Northwest Iowa as a whole holds potentially sufficient water supplies to depend on for the region's population and economic growth, which is not much out of line with the projection series made by the State of Iowa. The third objective of this study was to suggest an extended model for the future application to state and regions. Based on the resulting model, an impact analysis shows the effects of a change in demand and supply of certain resources on production, resource uses, and income. (Sinha-OEIS)

OPTIMAL WATER REUSE PLANNING,
Texas Univ. at Austin.
G. Ocanas Sanchez.
PhD Dissertation, 1980. 567 p, 59 Fig, 52 Tab, 61 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX81-00950.

Descriptors: *Wastewater treatment, *Water reuse, *Mathematical models, Planning, Economic aspects, Texas, Resource allocation, Model studies.

Current water and wastewater treatment technology allows the reclamation of almost any type of wastewater. Implementing water reuse practices within the framework of water allocation is an important aspect of the planning process. Mathematical models to assess various conjunctive water and wastewater system alternatives are developed. A single period model was first developed to determine the optimal water allocation within the region, and to assess the impact of various legal and environmental restrictions upon the system. This model was then expanded to incorporate the growing nature of the system. The resulting multi-period model considers the capacity expansion of the treatment facilities while assessing the impact of different planning scenarios. The mathematical optimization models consist of both linear and non-linear constraints and a non-linear objective function. The objective of the research was to develop and solve the mathematical planning models. Application of the models is illustrated by a series of hypothetical examples that were solved using the large scale generalized reduced gradient (LSGRG) code. A real world application is also presented using the San Antonio region as the study area. Both LSGRG and successive linear programming with rejection (SLPR) methods were used to obtain solutions to the models. The performance of both solution methods are briefly analyzed. (Sinha-OEIS)

ROBUSTNESS, RELIABILITY, RESILIENCE AND VULNERABILITY CRITERIA FOR PLANNING WATER RESOURCES SYSTEMS,
Cornell Univ., Ithaca, NY.
T. Hashimoto.
PhD Thesis, May, 1980. 125 p, 19 Fig, 10 Tab, 53 Ref, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-20833.

Descriptors: *Water resources development, *Planning, Future planning, Economic aspects, *Economic evaluation.

The ability of a water resource system to serve changing needs over time can be measured using a variety of criteria. The objective of this study is to define some criteria for evaluating possible system performance given uncertain future conditions and the likely variation in inputs and demand, and to show their applicability to specific management problems. For these purposes, robustness, resilience, reliability and vulnerability are defined and quantitative measures of them are given. Some conventional methods of dealing with uncertain and varying events involved in water resources planning are critically reviewed. Discussion on the need for the alternative criteria follow and their relevance and usefulness in water resources systems planning are emphasized. Robustness is defined as an economic measure. It represents variability involved in total costs of a system under uncertain future conditions, and supplements the conventional optimality criterion of cost-effectiveness. Definitions of resilience, reliability and vulnerability are given and quantitative measures are developed and then applied to planning the operation of a water supply reservoir. Conclusions are then drawn on the validity and applicability of the new methodology. (Sinha-OEIS)

Anglian Water Authority (England).
K. F. Clarke, C. Page, and J. S. Brew.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 1, p 61-73, January, 1980. 6 Fig, 2 Tab, 3 Ref.

Descriptors: *Water supply, *Management planning, *Water conservation, *Storage, *Long-term planning, Conservation, Flow discharge, Administration, Operating policies, Drought, Projection, Hydrologic data, Optimization, System analysis, Pumpage, Groundwater, Reservoirs, *United Kingdom.

An alternative method for defining the reliability of water resources is proposed. This method defines reliability in terms of the level of service to consumers, rather than in terms of the frequency of failure. It entails identification of conservation measures for drought periods and estimation of resultant savings; development of an operating strategy and defining a level of risk; and assessment of the level of service when a given output is met. The new method will provide a consistent basis for the planning of water resources and their operation. The use of computer-based mathematical models enables a wide range of levels of service to be calculated. (Titus-FRC)

MULTIOBJECTIVE ANALYSIS OF IRRIGATION PLANNING IN RIVER BASIN DEVELOPMENT,
Indian Inst. of Science, Bangalore. Dept. of Civil Engineering.
S. Vedula, and P. P. Rogers.
Water Resources Research, Vol 17, No 5, p 1304-1310, October, 1981. 2 Fig, 12 Tab, 18 Ref.

Descriptors: *River basin development, *Model studies, Mathematical models, Planning, *Irrigation practices, Irrigation, *Multiobjective planning, *India.

The historical development of a river basin is considered in which extensive irrigation is practiced in the lower reaches of the basin, while an expansion of irrigation development in the upper reaches is proposed. A 12-season (monthly) linear programing model is formulated to evolve optimum cropping patterns in the proposed areas of development. A tradeoff analysis between two conflicting objectives is made by developing the transformation curve for the objectives. The river basin selected for study is the Cauvery River Basin, with a total drainage area of 81,200 square km, located in the States of Kerala, Karnataka, and Tamil Nadu in Southern India. The monthly deterministic model was applied to this four-reservoir system to maximize the net economic benefits and the irrigated cropped area, subject to water, land, and downstream release constraints. The objectives of maximizing net benefits and irrigated cropped area are found to conflict with each other. The transformation curve between the two objectives was developed and the tradeoff was estimated

at the level of irrigation development as proposed by the planning agency. (Baker-FRC)

6B. Evaluation Process

THE REED AFFAIR: A CANADIAN LOGGING AND POLLUTION CONTROVERSY,

Waterloo Univ. (Ontario). School of Urban and Regional Planning.
R. Suffling, and G. Michalenko.
Biological Conservation, Vol 17, No 1, p 5-23, January, 1980. 4 Fig, 1 Tab, 40 Ref.

Descriptors: *Social aspects, *Political aspects, *Forest management, Economic aspects, Logging, *Ontario, Canada, Reed Paper Company, Treaties, Environmental effects, Water pollution sources, Mercury, Licenses, *Pulp and paper industry, Water quality, Legal aspects.

Events and biological, economic, and social issues in an Ontario pollution and forestry controversy are summarized. The native Ojibwa people of northern Ontario were given hunting and fishing rights by Treaty 9 (1906) in return for the title to their lands and their allegiance to the government. A controversy arose following the installation of a mercury cell chlor-alkali plant at the Reed Paper Co. mill in 1962. A total of 9000 kg, or 4.5-9 kg per day, of Hg were discharged into the Wabigoon River between 1962 and 1970. Another 13,600 kg are unaccounted for. Although the Hg cell plant was replaced by a permionic membrane process in 1975, the river remains contaminated. Subsequently, forest management practices in Ontario and their effects on the environment (including water quality) were closely examined. It was determined that the tree harvesting schemes proposed by the company would not allow management on a sustained yield basis. The Reed Controversy became a catalyst for political change. The Hartt Commission (The Royal Commission on the Northern Environment) was established to deal with three tasks: determine environmental (social, economic, and cultural) effects of major enterprises north of the 50th parallel, investigate feasibility of alternative uses of natural resources, and suggest means of assessing environmental aspects of major enterprises. PROJECT OUTCOMES CORRELATE WITH PUBLIC PARTICIPATION VARIABLES,

Ohio State Univ., Columbus. Dept. of Natural Resources.
R. A. Ellis, and J. F. Disinger.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1564-1567, November, 1981. 1 Tab, 6 Ref.

Descriptors: *Public participation, *Project planning, Public hearings, Administration, Wastewater facilities, *Wastewater management.

The relationship between public participation variables and project outcome variables was analyzed for wastewater treatment projects. Variables were identified from 105 case studies of project planning in wastewater management, water development such as flood control projects, and highway or roads construction. Projects resulting from redistributive policy were associated with undesirable outcomes and tended to have poor information flows. Problems were also experienced by small projects characterized by high social significance. On highly technical projects, it was found to be necessary to educate the public to avoid court battles or other legal actions resulting from misunderstandings. While formal hearings are usually antithetical to good two-way communication, workshops and more informal meetings showed promise of producing successful citizen inputs. (Small-FRC)

ESTIMATION OF THE ECONOMIC VALUE OF WETLANDS: METHODOLOGY AND APPLICATION TO SOUTHEASTERN MICHIGAN,

Michigan State Univ., East Lansing. Dept. of Agricultural Economics.
C. W. Abdalla, and L. W. Libby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168493, Price codes: A03 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University Technical Completion Report, September, 1981. 25 p, 1 Fig, 22 Ref, 3 Append. OWRT-A-116-MICH(1).

Descriptors: *Wetlands, *Freshwater marshes, Economic evaluation, Benefits, Costs, Decision making, *Michigan.

Greater understanding and awareness of wetland functions has led to enactment of wetland protection laws in many states. Michigan legislation requires a permit for wetland alteration. Permit decisions are based on the balancing of benefits and costs of proposed wetland uses. Economic concepts are used in this research to structure wetland permit decisions and improve policy choices. Benefit and cost estimation is attempted. A methodology is developed and applied to estimate the value of wetlands in waterfront residential use in southeastern Michigan. The results indicate that location is an important variable influencing development value making estimates site-specific and not generalizable. Strengths, weakness, and limitations of the methodology are assessed. The estimation of development and natural wetland values is a complicated task requiring careful economic analysis and much reliable informational input.

PLANNING LEVEL ESTIMATES OF THE VALUE OF RESERVOIRS FOR WATER SUPPLY AND FLOW AUGMENTATION IN NEW HAMPSHIRE,

New Hampshire Univ., Durham. Inst. of Natural and Environmental Resources.
S. L. Dingman.
Water Resources Bulletin, Vol 17, No 4, p 684-690, August, 1981. 7 Fig, 3 Tab, 10 Ref. OWRT-A-050-NH(2).

Descriptors: *Decision making, *Water supply development, New England, *New Hampshire, *Reservoirs, Water supply, Potential water supply, Water resources development, Estimating equations, Estimating.

When projected water use exceeds the safe yield of the existing supply system some decisions must be made. In general, the choice among reservoirs for water supply or flow augmentation is a multiobjective problem. Two of the objectives, the cost per unit of yield and the period of time over which a given reservoir will satisfy projected demand, require estimates of the increase in yield that potential reservoirs will provide. Methods are presented which permit such estimates to be made for direct supply and flow augmentation reservoirs in New Hampshire. An equation is given which can be used to calculate the increase in yield for direct supply reservoirs when the active storage capacity and mean flow at the reservoir site are known. The downstream increase in yield can also be estimated for flow augmentation reservoirs. The required input data for this computation are the active storage and mean flow at the downstream reach. The major uncertainties in the estimates are due to the difficulty in generalizing the influences of operating policies on the relation between regulation and downstream flow distributions. However, these methods appear to provide a rational and empirically supported basis for planning level estimates of the value of reservoirs for water supply and flow augmentation in central New England. (Baker-FRC)

Descriptors: *Evaluation, *Hydrologic data, *Groundwater, *Surface water, Streamflow, Runoff, Coal mines, *Coal mining, Strip mines, Soil horizons, Land use, Water quality, Chemical analysis, Legal aspects, *Indiana, Spencer County, Little Pidgeon Creek, Crooked Creek, Surcace Mining control and Reclamation Act (PL 95-87), Projections.

Protecting the nation's water resources is a major emphasis of the Surface Mining Control and Relclamation Act, PL 95-87. Permanent regulations established for this Act by the Office of Surface Mining (OSM) require the issuance of a permit before mining begins. An application for a mining permit must include an assessment of the hydrologic characteristics of the mining site and adjacent area, and a projection of the potential impacts of mining activities on surface water and ground water. OSM's permanent regulations and guidelines provide little insight on the 'how to' aspect of making the required hydrologic assessment. This investigation was completed to improve the understanding of the kinds of information needed to make such assessments by: (a) reviewing the regulations to determine what hydrologic information is required; (b) preparing an example hydrologic assessment using the regulations as a guideline; and (c) using the experience gained in (a) and (b) to identify areas lacking or needing additional data to make the required assessment. Hydrologic data for the study area were obtained from published and unpublished reports, maps, aerial photographs, personal interviews with residents in the area of the hypothetical mine site, and discussions with experts in the field. Where data were unavailable, 'synthetic' data were generated by extrapolation from proximate or similar watersheds and (or) by assumptions based on experience or theory. A limited amount of field data was collected to corroborate and augment information originating from all these sources. (USGS)

Mouchel (L.G.) and Partners, Bath (England).
C. Martin, and D. King.
Water Services, Vol 85, No 1026, p 409-410, 413-414, 417, August, 1981. 4 Fig, 2 Tab, 1 Ref.

Descriptors: *Control systems, *Computers, *Pumping plants, Automation, Wastewater treatment, *Cost-benefit analysis, Weymouth, *United Kingdom.

The current status of the control system for Radipole Lake Pumping Station is described, including the tendering procedure and cost-benefit analysis. The control system and operating methods are described. The system is based on the Texas Instruments 990/5 micro computer, and a cost-benefit analysis indicates that the control system will pay for itself in five years. All equipment will have manual overrides so operation can continue in the event of a computer failure. Mathematical models of the control system have been developed, and a prediction control program has also been developed. When installed, the system will represent a large fully instrumented catchment and will be usedful in future research projects. (Small-FRC)

COMPUTER MODELING OF FLOOD ALLEVIATION BENEFITS,
Severn-Trent Water Authority, Birmingham (England).
J. B. Chatterton, and E. C. Penning-Rowsell.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 107, No WR2, p 533-547, October, 1981. 5 Fig, 2 Tab, 18 Ref.

Descriptors: *Storm runoff, *Flood protection, *Economic aspects, *Future planning, *Computer models, Model studies, Flood proofing, Decision making, Cost analysis, Computer programs, Hydraulic models, Sensitivity analysis, Bristol, England.

When planning storm drainage or flood protection schemes, it is economically beneficial to evaluate several alternative design standards by computer modeling. A computer model is presented which allows the decision maker to select that calculation of discounted benefits most appropriate to the proposed scheme and the design flood conditions. The computer model incorporates national data on flood damage along with programmable site-specific damage data obtained from surveys or questionnaires. Alternative techniques are also available for relating properties at risk to flood profile information. Optional sub-routines are featured which generate a full discounted cash flow analysis of both scheme cost and benefits. The data sets and the control options fixing the economic and hydrologic assumptions for each assessment may be interchanged to allow for sensitivity analysis. The model may be utilized to evaluate many different design standards with minimum economic errors. The assumptions on calculated benefits most crucial to the final results can be explored in great detail while excluding the less important factors to allow a more comprehensive, accurate and faster evaluation of both structural and nonstructural flood alleviation schemes. Application of the model in Ashton Vale, Bristo, England is illustrated. (Geiger-FRC)

WEST SACRAMENTO CANAL UNIT REFORMULATION,
Bureau of Reclamation, Sacrameto, CA. Mid-Pacific Region.
--Concluding Report on the feasibility investigation, June, 1981. 18 p, 1 Fig, 2 Tab.

Descriptors: *Feasibility studies, *Cost-benefit analysis, *Water resources development, Water supply development, Economic feasibility, Canals, Reservoirs, Water storage, Reservoir storage, *Tehama-Colusa Canal, California.

The 1964 feasibility investigation proposed extending the Tehama-Colusa Canal, then newly under construction, through Yolo County to a terminal reservoir just northeast of Fairfield in Solano County, California. The extension, the West Sacramento Valley Canal, would provide a supplemental water supply to portions of Napa, Solano, and Yolo Counties. An exchange arrangement with Yolo County would also permit Lake County to obtain a supply from the unit. Events occurring after the publication of the 1964 document delayed further work on the ivestigation, but in the late 1970's, interest in the unit was renewed, and a reformulation to update the 1964 plan was initiated. Comparison of benefits and costs indicates that the national economic development plan for the proposed West Sacramento Canal Unit has an unfavorable benefit-cost ratio. While the municipal and industrial portion of the plan is economically justified, the irrigation portion is not. Middletown Dam and Reservoir in Lake County now has an unfavorable economic justification. A need does exist, however, for Central Valley Project (CVP) water storage. Sites Reservoir is capable of conserving surplus flows for later CVP uses, thereby increasing basin water supply efficiency. Extra yield and interim water available while unit needs were increasing could be utilized in the San Joaquin Valley. (Moore-SRC)

SUMMARY; LOWER COLORADO RIVER RECREATION RESEARCH, 1974-1980,
Arizona State Univ., Tempe. Dept. of Leisure Studies.
G. W. Greey, and G. W. Cheatham.
Report prepared for Bureau of Reclamation, August, 1981. 109 p, 67 Tab, 2 Append.

Descriptors: *Colorado River, *Recreation, *Recreation demand, Prediction, Resources management, Water resources development, Camping, Swimming, Boating, Lake Mead, Fishing, Arizona.

This report presents a summary of research data on outdoor recreation use and visitor use patterns within the Lower Colorado River from Pierce Ferry, Arizona, to San Luis on the Mexican border. Each of the ten divisions was studied for a one year period during 1974-77, and a replicate study was completed in 1977-78. The Lake Mead National Recreation Area was studied during the calendar year 1979. Visitor number and recreational activities were quantified by direct observation, and are presented on a quarterly basis for the study/year. Land based activities recorded were: camping, hunting, picnicking, hiking/related, driving for pleasure, motorcycling/horseback riding, off-the-road vehicle use, and other, and water based activities included: swimming/related, fishing, motor boating, water skiing, non-motor boating, canoe/kayak, house boating, tubing, and sailing. There was much variation between divisions, but overall there was a significant increase in visitors, recreation units and recreation participants throughout the lower Colorado River. The activities with the largest percentage increases were driving for pleasure, sailing, canoe/kayak, and picnicking, while house boating, hiking, motorcycling, off-the-road vehicle use and other decreased. The most popular activities in the replication study year were picnicking, camping, swimming/related, motor boating, and driving for pleasure. The information will be used in long-term projections of use, and in management planning. (Brambley-SRC)

CASCADED TRADEOFFS: A MULTIPLE-OBJECTIVE, MULTIPLE-PUBLICS METHOD FOR ALTERNATIVES EVALUATION IN WATER RESOURCES PLANNING,
Portland State Univ., OR.
B. F. Anderson.
Bureau of Reclamation Report, August, 1981, 123 p, 23 Fig, 157 Ref, Append.

Descriptors: *Decision making, *Planning, *Public participation, Water resources development, *Multiobjective planning, Alternative planning, Economic impact, Social impact.

Cascaded Tradeoffs is a method for arriving at an overall ranking of planning alternatives on the basis of public values. The key feature of the method is that it provides for making tradeoffs across both issues, or dimensions of impact, and publics, in a two-step cascade. A scale of commensuration is established on the basis of value judgements from both representatives of the impacted population and agency decision makers. Commensuration is the process of determining what impact on one dimension is equivalent to a given impact on another, or what impact to one public is equivalent to a given impact to another. The method begins by identifying publics across which the greatest value differences occur and within which value differences can be assumed to be negligible. Commensuration is then accomplsihed in two cascaded steps: first across dimensions of impact within each public, in terms of the values of that public; then across publics, on the basis of a judgement by agency decionmakers about a tradeoff dimension. Traditional economic analyses of market values can be helpful in the first step, but not always in the second. There appears to be no generally applicable alternative to human judgement for comparing the values of different publics. The method provides for examination of the extent to which the overall ranking of the alternatives is sensitive to the addition of mitigation measures and to uncertainty in the data. (Moore-SRC)

COST ESTIMATES FOR WATER TREATMENT PLANT OPERATION AND MAINTENANCE.
Public Works, Vol 111, No 8, p 81-83, August, 1980. 5 Tab.

Descriptors: *Cost analysis, *Operation and maintenance, *Potable water, Water quality standards, *Water treatment facilities, Estimated costs.

Information contained in a four-volume report on estimation of water treatment costs (EPA-600/2-79-162a (August)) is presented in summary form. The report considers unit processes and combinations of unit processes that are capable of removing contaminants included in the National Interim Primary Drinking Water Regulations. Conceptual designs are formulated and costs are estimated for each unit process. Estimated cost factors include labor, electrical energy, natural gas, diesel fuel, chemicals, maintenance material, sludge disposal, and amortized capital. Package complete treatment plants, conventional treatment plants, direct filtration plants, reverse osmosis systems, pressure ion exchange softening systems, lime softening systems, pressure filtration plants, and granular activated carbon plants are discussed, and at least one example is presented for each. Corrosion control is also considered. (Small-FRC)

AN ECONOMIC ANALYSIS OF WATER RESOURCES DEVELOPMENT IN DELTAIC REGIONS OF ASIA: THE CASE OF CENTRAL THAILAND,

Wisconsin Univ.-Madison.
Q-T. Ngo.
PhD Thesis, 1980. 302 p, 20 Fig, 33 Tab, 4 Map, 4 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-15222.

Descriptors: *Water resources development, *Irrigation, *Economic aspects, *Deltas, Agriculture, Saline water intrusion, Flooding, *Thailand.

In the large deltaic regions of Burma, Thailand and Vietnam large rivers which drain the entire basin yearly overflow their banks to flood large tracts of the vast and flat deltas. In the dry season, saline waters from the sea intrude large areas upstream. Water resource development for such an area requires an integrated approach with complementary facilities to distribute and drain water, to store flood flows during the wet season, and to coordinate releases from surface storage for dry season irrigation, for waterway transport, and for repelling saline water at the estuary. When translated in economic terms, the features of this development program dictate the mobilization of enormous amounts of resources for the provision of land improvement infrastructure. A preliminary objective is to analyze the patterns of agricultural development with the purpose of identifying the relevant constraints to growth. Where under heavy population pressure, the arable land frontier has approached exhaustion, intensification of cultivation by raising output per cultivated area may prove to be the most efficient strategy for development. The focus of this study on the importance of irrigation and drainage is only meant to bring out the magnitude of resource requirements needed for the intensification of cultivation in large alluvial plains. (Sinha-OEIS)

WATER FOR INDUSTRY,

Tata Consulting Engineers (India).
B. V. Chitnis.
Aqua, No 2, p 22-24, 1981.

Descriptors: *Water demand, *Water use, *Water resources development, Political aspects, Water supply development, *India, Economic aspects, Governmental interrelations, Government supports, Water quality, Irrigation, Domestic water, Energy, Industrial water.

India is considered well endowed with water supply. Of the current annual supply, 0.16% is used for energy production, 92.5% for irrigation, 1.2% for industrial needs and 6.2% for domestic purposes. In 1975 India withdrew for its total usage about 21% of the probable maximum developable supply. It is expected that in the year 2000 AD, India will use about 54% of the probable maximum, or nearly 68% of the dependable maximum with storage. The percent usage figures for 2000 AD will be 0.5% for non-hydro power, 88.6% for irrigation, 3.6% for industry and 7.3% for domestic purposes. Irrigation is not only the biggest user in terms of quantity, it is also the most powerful user in terms of political leverage. Irrigation returns only 10% of the water it withdraws. The irrigation departments have been pioneers in developing many of the water storage projects in the country. Irrigation has built an extensive water transport network which could be conveniently used by the nonhydro power, industrial and domestic users. Domestic and industrial users are in competition in the larger cities, as their population growth continues to expand rapidly. The recycling of solid water and its subsequent use by either industrial and/or irrigation consumers is being considered for future benefits. Not only must water conservation be increasingly important, a cooperative solution to the treatment of industrial effluents must also be established. The Government's role in the development of water resources will be seen as critical in the coming years as India approaches the limits of the water availability. (Baker-FRC)

GEOLOGY AND WATER AVAILABILITY OF DALLAS COUNTY, ALABAMA,

Geological Survey, Univ., AL. Water Resources Div.
J. C. Scott, H. G. Golden, and J. G. Newton.
Alabama Geological Survey Map 180, 1981. 94 p, 3 plates, 14 Fig, 6 Tab, 30 Ref.

Descriptors: *Available water, *Surface water, *Groundwater, *Water quality, Water yield, Streamflow, Wells, Aquifers, Hydrologic budget, Geohydrology, *Well data, Chemical analysis, Potential water supply, Hydrologic data, Maps, Evaluation, *Alabama, Dallas County.

Geologic units underlying Dallas County, Ala., include deposits in the Upper Cretaceous, Paleocene, Pleistocene, and Holocene Series. The deposits range in thickness from 750 to 2,600 feet and consist of sand, gravel, clay, chalk, sandstone, and limestone. Strata in the Upper Cretaceous and Paleocene Series strike southeastward and dip southwestward 30 to 50 feet per mile. The Alabama River, the largest source of surface water, has an average flow of 17,100 mgd (million gallons per day) and a median low flow of 5,000 mgd at Selma. Other significant sources include the Cahaba River and Mulberry, Pine Barren, Oakmulgee, Boguechitto, and Cedar Creeks. The Gordo and Eutaw Formations, the major sources of ground water, will yield 1 to 2 mgd to individual wells in the northeast part of the county and are potential sources of similar supplies in central and southern parts. Potential sources of large quantities of ground water are the Coker Formation and alluvium and low terrace deposits. Water of suitable quality for most uses is available from streams and aquifers. Water in the Alabama River and Cahaba River is soft and generally contains less than 100 mg/L (milligrams per liter) of dissolved solids. Water in tributary streams draining areas underlain by calcareous deposits is generally moderately hard to hard and contains less than 250 mg/L of dissolved solid. Water in the Eutaw Formation in the southeast part of the county has a chloride content that exceeds 1,000 mg/L, and, in that area, water in the underlying Gordo and Coker Formations is probably sufficiently mineralized to be objectionable. DEMAND FORECASTING IN WATER SUPPLY NETWORKS,

Imperial Coll. of Science and Technology, London (England). Dept. of Civil Engineering.
P. F. Perry.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY9, p 1077-1087, September, 1981. 4 Fig, 1 Tab, 17 Ref.

Descriptors: *Water demand, *Pumping stations, *Forecasting, Model studies, Planning, Water distribution, Kalman filter, Prediction, Networks, Water supply systems, Reservoir operation, Automatic control, *United Kingdom.

An accurate hour-by-hour forecast of water demand is determined with data from an advanced telecontrolled water supply network in the United Kingdom. This type of forecast, more difficult than an aggregate 24-hour forecast, is important for achieving energy savings for reservoir systems which have off-peak pumping stations with variable speed drives. The Kalman filter approach is more attractive than the Karhunen-Loeve spectral expansion method because the state estimates of residuals demand, required for the forecast calculations, can also be used directly for optimal pump control. In addition, the Kalman filter method allows easy updating of the model (15 sec computer time) once parameters have been estimated from historic data (5 min computer time). The spectral expansion method is accurate for the 24-hour prediction period, takes little computer time, and needs only past values of water demand as data. However, it requires substantial storage and completely new calculations for updating on-line pump controls as new observations are received. (Cassar-FRC)

WATER RESOURCES APPRAISALS FOR HYDROELECTRIC LICENSING: ALASKA RIVER BASINS, ALASKA.

Federal Energy Regulatory Commission, San Francisco, CA. San Francisco Regional Office.
Available from the National Technical Information Service, Springfield, VA 22161 as FERC-0068, Price codes: A03 in paper copy, A01 in microfiche. Planning Status Report FERC-0068, Revised January, 1981. 32 p, 4 Fig, 6 Tab.

Descriptors: *Water resources development, *Alaska, *Rivers, *Hydroelectric plants, Federal jurisdiction, Wilderness areas, Wild rivers, National parks, Land use, Cooling water, Planning, River basins, *River basin development.

This revised report presents updated information on the water resources of the river basins of Alaska, and information on new and planned developments. There are 20 hydroelectric projects, existing or under construction, with a total installed capacity of 157,780 kw. An additional 10 projects are in the preliminary and planning stages. Large areas of Alaska have been placed under wilderness protection (56.4 million acres), and national parks or wildlife refuges (49 million acres), and 25 streams have been added to the National Wild and Scenic Rivers System, with a further twelve to be considered. Of the 98 potential hydroelectric power projects, 15 have potential conflicts with the Federal lands designations, and their development would seem to be impossible. The environmental impacts of other developments are not known and may be significant. There is considerable potential for pumped storgage hydroelectric and tidal power development, but practical factors, environmental impacts, and lack of markets render development impractical. Cooling water requirements for steam-electric generating plants are projected to be 431 mgd withdrawn and 7 mgd consumed by 2000. (Brambley-SRC)

6E. Water Law and Institutions

A PRELIMINARY SURVEY OF STATE GROUND-WATER LAWS,

National Center for Ground Water Research, Oklahoma City, OK.
G. Wickersham.
Ground Water, Vol 19, No 3, p 321-327, May/June, 1981. 1 Tab, 15 Ref.

Descriptors: *Water law, *State jurisdiction, *Groundwater management, Water policy, Legal aspects, Arizona, Water management, Water conservation, Regulations, Permits, Well permits, Water quality standards, Water quality control.

A survey of groundwater laws in 24 states showed several control measures common to many states--licensing of water well drillers, requirement of well permits before drilling, and establishment of groundwater management districts. Four states and Guam have groundwater quality standards. New York has the most complete list of chemical parameters, 83. New Jersey sets stricter limits for the Central Pine Barrens than for other areas of the state. Western states are active in new comprehensive groundwater legislation. No one law can be used as a model for all states because hydrology and development are so variable. However, Arizona's new groundwater laws are nearly a model. The 1980 Groundwater Management Act created a statewide management and conservation program, to be implemented over 5 years. It requires registration of all water wells and filing of annual pumpage reports. The four driest regions have a pump tax, mandatory conservation for farmers and industry, and per capita consumption limits for cities. No new irrigated agriculture is allowed. The goal is safe yield by 2025. (Cassar-FRC)

SECONDARY TREATMENT WAIVERS ISSUED, CONTROVERSY CONTINUES,
C. Dalpra.
Journal of the Water Pollution Control Federation, Vol 53, No 11, p 1554-1557, November, 1981. 1 Tab.

Descriptors: *Legal aspects, *Secondary wastewater treatment, *Wastewater facilities, *Coastal waters, Water quality standards, Environmental effects, Environmental protection, Ocean dumping, Pacific Ocean.

Controversy over the United States Environmental Protection Agency's waivers of secondary treatment to six communities discharging wastes and wastewater into the Pacific Ocean is discussed. The EPA has had to make these decisions with little historical or environmental procedent. Some opponents of the program feel it is too lax, while others find it too restrictive. The General Accounting Office has criticized the program, stating that hundreds of communities have been prevented from applying for waivers because of restrictive EPA regulations and Congressional legislative restraints. The report estimated a potential savings of up to $10 billion if waivers were granted to the 846 communities within one-half mile of a coastline. Recent litigation may force the EPA to reopen the waiver application process. (Small-FRC)

WATER POLLUTION CONTROL IN THE FEDERAL REPUBLIC OF GERMANY,
H. Hornef.
Aqua, No 2, p 11-16, 1981. 2 Fig, 3 Tab, 21 Ref.

Descriptors: *Germany, *Water pollution control, *Legal aspects, Governmental interrelations, Political aspects, Sanitation, Wastewater treatment, Effluents, Clarification, Industrial effluents.

The water resources policy of the Federal Republic of Germany places foremost emphasis on water pollution control. Its objectives are to maintain or re-establish the ecological balance of waters, to maintain secure water supplies to the population and industry, and to preserve on a long term basis other uses of water resources serving the public welfare. The Federal Government has the overall power to enact laws concerning management of water resources. Various legal instruments were established during the 1970's to provide for more efficient water pollution control. Although efforts have been made, the poor quality of several reaches of waters, including the Rhine, continues to speed efforts for improvement. The use of recycled water by industry and public power utilities is increasing. One of the major tasks at hand is the reduction of the pollution load on waters caused by biodegradable substances. In addition to the encouraging developments in the construction of clarification plants, it has become increasingly obvious that selective retention of critical pollutants must be pursued. Finally, water pollution control must be directed toward preventing the formation of harmful effluents from the outset. Development work must continue on pollution-controlled manufacturing processes and products. The problem of pollutants can only be solved if even closer and more trusting cooperation is attained between public authorities and industry, particularly the chemical industry. (Baker-FRC)

LEGAL QUESTIONS AND PROBLEMS OF KANSAS GROUNDWATER MANAGEMENT DISTRICTS,
Kansas Water Resources Research Inst., Manhattan.
J. C. Peck.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168477, Price codes: A04 in paper copy, A01 in microfiche. Contribution No 218, September, 1980. 53 p. OWRT-A-099-KAN(1), 14-34-0001-0118.

Descriptors: Water management, *Water law, Water policy, Water allocation, Groundwater management districts, *Kansas, Legal aspects.

The 1972 Kansas Groundwater Management District Act provided a mechanism for local control of groundwater resources. The five groundwater management districts (GMD's) established to date are following the statutory procedure of establishing management programs and recommending rules and regulations to the Chief Engineer of the Division of Water Resources of the State Board of Agriculture, the key water rights administrator of the state. The enabling act itself may have a constitutionality problem because of Art. 2, S 21 of the Kansas Constitution which provides that matters of local legislation may be conferred on political subdivisions by the legislature. Groundwater problems, being larger than a local concern, might be deemed to be in the purview of the legislature, not local units of government. The right granted the Chief Engineer to declare 'intensive groundwater use control area' within GMD's, insofar as he may shut down appropriators without regard to priority dates, may have consistitutional problems. GMD's may sue and be sued, but they should have express statutory causes of action before they can bring the suit. Thus, only the Chief Engineer is able to bring suit for a violation of the regulations, notwithstanding sections in these regulations that purport to give GMD's that power. GMD's may sue to enforce 'policies and standards' of the GMD. The well spacing, safe yield and depletion regulations passed to date may be contested by unsuccessful permit applicants on several grounds. To insure their validity, the GMD's should be sure that the various figures used in the requirements have a supportable basis.

DIGEST OF WATER RESOURCES POLICIES AND AUTHORITIES.
Office of the Chief of Engineers (Army), Washington, D.C.
Pamphlet No 1165-2-1, March, 1981. 268 p, 5 Tab.

Descriptors: *Legal aspects, *Public policy, *Water resources development, *Construction, Civil engineering, Water supply, Water quality, Wildlife, Conservation, Navigation, Flood control, Erosion control, Hydroelectric power, Recreation, Wetlands, Environmental effects.

It is the policy of the Corps of Engineers to develop, control maintain, and conserve the Nation's water resources in accordance with the laws and policies established by Congress and The Administration. Actions taken comply with all relevant environmental statutes, have no significant safety problem, and are in the overall public interest. A summary is presented of the existing administrative and legislative water resources policies and authorities pertinent to the civil works activities of the Corps. The Federal responsibility in water resources; legislative, executive, judicial roles and policies; general policies; management of the civil works program; planning investigations; report preparation, processing and project authorization; programming, budgeting and appropriations; post authorization studies and engineering design; construction; and operations, maintenance and project management are aspects of the Corps programs. Corps civil works projects include those concerning navigation, flood damage reduction, beach erosion control, hurricane protection, stream bank erosion control, hydroelectric power, recreation, water supply and quality management, fish and wildlife conservation, wetlands conservation, and aquatic plant control. The Corps also has regulatory functions concerned with navigable waters and the disposal of dredged or fill materials into the waters of the U.S. (Moore-SRC)

6G. Ecologic Impact Of Water Development

THE ENVIRONMENTAL EFFECTS OF HYDROELECTRIC PROJECTS,
G. [illegible] Kenyon.
Canadian Water Resources Journal, Vol 6, No 3, p 309-314, 1981.

Descriptors: *Hydroelectric power, *Environmental effects, *Water level fluctuations, Water resources development, Dam effects, Reservoir operation, Wildlife habitats, Fish barriers, Social impact, Water quality, Recreation facilities, Fluctuations, Scour, Flood damage, Forests.

The advantages of hydroelectric power--simple, renewable, and nonpolluting--must be balanced against the environmental impacts, particularly of large projects. Flooding behind a dam takes fertile bottomland out of production; destroys prime forest land; disturbs wildlife, fish, and human habitats; increases water temperature; changes water quality; and inundates scenic rivers. Fluctuating water levels and changes in flow regimes during operation of a hydroelectric station create a dead littoral zone around the reservoir, drown forests, affect recreational use, disturb waterfowl nesting sites, cause scour and flushing downstream, and can produce nitrogen supersaturation in thespillway area. Small hydroelectric projects may retain many of the benefits without the unfavorable environmental effects produced by megaprojects. (Cassar-FRC)

ON THE ALGAL ECOLOGY OF THE LOWLAND IRAQI MARSHES,
Sulaimaniyah Univ. (Iraq). Dept. of Biology.
B. K. Maulood, G. C. F. Hinton, B. A. Whitton, and H. A. Al-Saadi.
Hydrobiologia, Vol 80, No 3, p 269-276, 1981. 3 Fig, 4 Tab, 20 Ref.

Descriptors: *Marshes, *Algae, Phytoplankton, Tigris River, Euphrates River, *Iraq, Deltas, Diatoms, Water quality, Cyanophyta, Epiphytes, Chlorophyta, *Ecology.

The marshes of the Tigris-Euphrates delta, Iraq, little changed in recent historical times, now face environmental effects from drainage projects, three dams, reed-harvesting, water transfers, and oil field development. A documentation of the algal community in boat channels during February 1978 and September 1979 showed that epiphytes, especially the filamentous type, were abundant. Filamentous green algae were more common in February, and blue-greens in September. Diatoms dominated the phytoplankton. Planktonic blue-green algae were mainly coccoid form; bloom-formers were rare. Heterocystous blue-green algae from boat hulls showed distinct laminations made of different species. Water in this region was slightly saline (0.2 0/00 to 1.33 0/00), varied widely in temperature (15 to 28.5 C), and was relatively turbid, calcerous,

and mesotrophic with respect to P and N. (Cassar-FRC)

ENVIRONMENTAL IMPLICATIONS AND ASSESSMENTS OF HYDROELECTRIC PROJECTS,

Inland Waters Directorate, Ottawa (Ontario).
P. J. Reynolds, and S. H. Ujjainwalla.
Canadian Water Resources Journal, Vol 6, No 3, p 5-19, 1981. 35 Ref.

Descriptors: *Hydroelectric plants, *Environmental effects, Planning, Monitoring, Ecological effects, Forests, Fish, Wildlife, Recreation, *Canada, *Cost-benefit analysis, Social impact, Water quality, Transmission lines, *Water resources development.

Hydroelectric power development can be compatible with the environment if projects are planned properly with input from the public and government agencies. Possible benefits of power development are construction of roads, communications, and services; new jobs and industry; possible opportunities for hunting and fishing; reforestation; increases in tourist activities; and building of new communities. The many 'disbenefits' include damage of fishing, wildlife, forests, shorelines, and water quality; flooding; recreational losses; dislocation of people; and disturbance by high voltage transmission lines. Even after 10 years of formal environmental impact assessments in Canada problem areas remain: (1) inadequate analytical techniques, (2) lack of assessment review procedures and manuals, (3) hurried environmental assessment reviews, and (4) absence of a detailed monitoring program supervised by a regulatory agency. It is suggested that cost-benefit analyses of environmental investigations be conducted. (Cassar-FRC)

HYDROACOUSTIC SURVEYS OF FISH ABUNDANCE AND DISTRIBUTION IN TWIN LAKES, COLORADO,

Washington Univ., Seattle. Coll. of Fisheries.
R. E. Thorne, and G. L. Thomas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-122250, Price codes: A02 in paper copy, A01 in microfiche. Water and Power Resources Service Report REC-ERC-81-4, April, 1981. 19 p, 8 Fig, 3 Tab, 15 Ref.

Descriptors: *Trout, *Fish populations, *Spatial distribution, *Pumped storage, Hydroelectric plants, Environmental effects, Reservoirs, Preimpoundment, Limnology, Juvenile growth stage, *Twin Lakes, Colorado.

Twin lakes are a pair of montane drainage lakes of glacial origin located on Lake Creek in central Colorado. The northwest corner of the lower lake is the site of the Mt. Elbert Pumped-Storage Powerplant, which is scheduled to begin operation during 1981. Water will be pumped from the lower lake up into a newly constructed forebay reservoir. A scheduled increase in the water surface elevation will inundate the isthmus between the two lakes, creating one larger reservoir. Concern exists over the effects of the powerplant on the ecology of the lakes, and especially on lake trout. Hydroacoustic surveys were conducted on Twin Lakes during September 1980 in order to measure the size and distribution of the resident fish population. Two distinct size groups of fish were observed: large fish below the thermocline (about 12 m) and small fish in the epilimnion. Net samples indicated that the large fish were predominately lake trout. Their estimated population size was 14,600, with 95% confidence limits of 4,100 to 25,000. The relatively large confidence intervals were the result of the relatively low fish density and its contagious distribution. The small fish were not identified, but may have been juvenile lake trout. Data presented in this report will be used along with those collected from other preoperational studies at Twin Lakes to form a pool of information for comparison with data collected following commencement of powerplant operations. WATER QUALITY OF THE PROPOSED NORDEN RESERVOIR, NEBRASKA, AND ITS IMPLICATIONS FOR FISHERY MANAGEMENT,

Bureau of Reclamation, Denver, CO. Lower Missouri Region.
J. W. Yahnke.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-149345, Price codes: A04 in paper copy, A01 in microfiche. Bureau of Reclamation Report REC-ERC-81-8, May, 1981. 56 p, 6 Fig, 7 Tab, 62 Ref, Append.

Descriptors: *Eutrophication, *Dissolved oxygen, *Reservoirs, *Water quality, *Environmental effects, Thermal stratification, *Fisheries, Cyanophyta, Reservoir releases, Simulation, Model studies, Nutrients, *Norden Reservoir, Nebraska.

After the filing of the Final Supplement to the Environmental Impact Statement on the O'Neill Unit, the Environmental Protection Agency expressed concern over the potential for excess productivity in Norden Reservoir, a major feature of the O'Neill Unit, and consequent hypolimnetic oxygen depletion in the reservoir if it should become thermally stratified for an extended period of time. A combination of nutrient loading models and a temperature simulation model were used to project the trophic state, productivity, and duration of stratification of the reservoir. The trophic state index indicated that the reservoir would be eutrophic; the estimated mean annual chlorophyll a concentration indicated a high likelihood that algal blooms would occur. A classification function was applied to the reservoir to evaluate whether the blooms would consist of blue-green or nonblue-green algae. The results show a 98% probability that blue-green algal blooms will occur. Dissolved oxygen curves for the reservoir were then developed for the period immediately prior to fall overturn. Curves were developed based on a reservoir with similar nutrient loadings and on theoretical curves. From these and the temperature model, oxygen concentrations in the reservoir discharge were estimated. The dissolved oxygen may be sufficient to support aquatic life but may fall below the Nebraska standard under certain circumstances. The reservoir and the river downstream are expected to support a cold-water fishery; most species now present in the river will be eliminated. The methods developed for this study may have application to other impoundments where an analysis is required to answer questions concerning the potential for such problems. (Moore-SRC)
W82-02983

RESULTS OF FISHERIES INVESTIGATIONS AT TWIN LAKES, COLORADO; 1973-76,

Colorado Div. of Wildlife, Fort Collins. Research Center.
L. M. Finnell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-145129, Price codes: A04 in paper copy, A01 in microfiche. Bureau of Reclamation, Report REC-ERC-80-5, August, 1981. 52 p, 21 Fig, 8 Tab, 25 Ref, 4 Append.

Descriptors: *Pumped storage, *Trout, *Environmental effects, *Lake fisheries, Sport fishing, Crustaceans, Hydroelectric plants, Supersaturation, Limnology, Turbines, Fish food, Turbidity, *Twin Lakes, *Colorado.

Construction and operation of the pumping-generator plant project at Twin Lakes, as well as the enlargement of the lakes, could have detrimental effects on the sport fishery in the lakes. Preoperational studies were conducted at Twin Lakes during 1973-1976 to estimate fisherman use and harvest of both naturally reproduced lake trout, and stocked creel-sized rainbow trout; and to document relative abundance and spatial distribution of lake trout and opossum shrimp (Mysis relicta). An estimated 100,000 man-hours of fishing effort were expended yearly during the summer, with an additional 4000-5000 hours recorded on the lower lake in December-January. Game fish harvest ranged from 25,000 to 43,000 rainbow trout and 1200-1500 lake trout over 380 mm long. Gill-netting operations conducted during May, August, and November 1974-1975 revealed no significant differences in lake trout abundance between months or years, but a majority of the lake trout were captured from depths exceeding 15 m. Monthly benthic trawls for opossum shrimp during ice-free months showed that mean population numbers increased over the summer from 20/sq m to a peak of 96/sq m in late August to early September. Powerplant operations may result in a loss of game fish through the pump-turbines, and a loss through the Twin Lakes Dam outlet works. There may be a buildup of gases in the water during generating cycles, which could cause heavy fish mortality. Operation of the powerplant may also change the lake temperature and increase the turbidity. (Moore-SRC)

STATISTICAL CONSIDERATIONS AND SAMPLING TECHNIQUES FOR GROUND-WATER QUALITY MONITORING,

Louisiana Technical Univ., Ruston. Dept. of Agricultural Engineering.
J. D. Nelson, and R. C. Ward.
Ground Water, Vol 19, No 6, p 617-625, November/December, 1981. 1 Fig, 22 Ref.

Descriptors: *Monitoring, *Sampling, *Statistical methods, Water quality, Water sampling, Groundwater.

Statistical techniques are incorporated into groundwater sampling to obtain the optimum information from a minimum number of samples for both special studies and routine monitoring. The optimum number of required samples is based on a specified confidence interval about the mean of the variable under consideration. If the observations are independent in space and time, the number of samples can be determined. However, if the samples are spatially or serially correlated, the sample size must be increased to obtain the same amount of information that would be obtained in uncorrelated observations. The advantages and disadvantages of several sampling techniques are discussed. Simple random sampling can be applied to sampling in space and in time. The population must be defined according to the objective of the study. The primary use of systematic sampling is sampling in time, because it collects a sample every certain number of units or every designated interval. In cases of periodic variation the sampling interval must be carefully chosen to give reliable results. In stratified random sampling the total population is divided into nonoverlapping subpopulations, referred to as strata. This stratification may be by area, time, or season. The variance for simple random sampling is greater than for systematic or stratified random sampling. For serially correlated populations stratified random sampling is better than simple random sampling. Systematic sampling is more precise than stratified random sampling in some cases, possibly in groundwater monitoring. (Cassar-FRC)

HOW ABIOTIC FACTORS AFFECT THE DISTRIBUTION OF TWO SPECIES OF TROPICAL PREDACEOUS AQUATIC BUGS (FAMILY: NAUCORIDAE),

Michigan Univ., Ann Arbor. Div. of Biological Sciences.
R. J. Stout.
Ecology, Vol 62, No 5, p 1170-1178, October, 1981. 6 Fig, 8 Tab, 9 Ref.

Descriptors: *Aquatic insects, *Population dynamics, *Flood flow, Flow velocity, Streamflow, Flood discharge, Natural streams, Costa Rica.

This study of contrasting Costa Rican stream sites determined how two types of stream hydrolocoris insularis Chapman and Cryphocricos latus Usinger. The two streams, the Sabalo and the Sura, had different maximum velocities and direction of flow during floods,different flood frequencies, different flood substrata type, and different mobility of substrata during floods. Backflooding in the Sura had no subsequent effect on the abundance or distribution of either species. In the Sabalo, nymphal populations of L. insularis decreased significantly after a spate because of loss of numbers and loss of previous habitat. Nymphs and adults of C. latus were more abundant under conditions of fast currents, large rocks, and coarse-grained pebbles. Population distribution patterns for the two species were explained by differences in flooding characteristics of the streams. (Small-FRC)

REMOTE DETECTION OF NUTRIENT AND WATER DEFICIENCIES IN SUGARCANE UNDER VARIABLE CLOUDINESS,

Science and Education Administration, Phoenix, AZ. Water Conservation Lab.
R. D. Jackson, C. A. Jones, G. Uehara, and L. T. Santo.
Remote Sensing of Environment, Vol 11, No 4, p 327-331, September, 1981. 1 Fig, 2 Tab, 2 Ref.

Descriptors: *Remote sensing, *Sugarcane, *Nutrients, Infrared radiation, Water stress, Cloud cover, Irradiance, Potassium, Nitrogen, Vegetation.

Nitrogen, potassium, and water deficiencies in sugarcane crops were detected by spectral measurements in the infrared band (0.76-0.90 microns) and red band (0.63-0.69 microns) taken with a radiometer mounted on a 4 meter aluminum pole. The infrared/red ratios of a well nourished and adequately watered sugarcane field (averaged 17.4) were significantly higher than those measured over a N-deficient plot (9.3), a K-deficient plot (16.2), and a waterstressed plot (15.1). Although radiance values varied by a factor of 5 in both bands over a range from direct sunlight to full shade, the infrared/red ratios under the same conditions were fairly constant, 15.8-16.5. This technique is reliable only after the ground is completely covered with vegetation, usually 3 to 4 months after planting. (Cassar-FRC)

WATER MANAGEMENT IN THE NORTH DESCHUTES UNIT IRRIGATION DISTRICT: GEOGRAPHIC PERSPECTIVES AND REMOTE SENSING APPLICATIONS,

Oregon State Univ., Corvallis. Dept. of Geography.
M. D. Nellis.
PhD Thesis, 1980. 270 p, 24 Fig, 34 Tab, 99 Ref, 12 Append. University Microfilms International, Ann Arbor, MI; Order No GAX80-18944.

Descriptors: *Water management, *Irrigation, *Remote sensing, Aerial photography, Infrared imagery, Irrigation districts, *Oregon, Thermal infrared imagery, Color infrared photography.

The North Unit Irrigation District of Central Oregon is characterized by limited water and the need for efficient utilization and control of the irrigation system. The primary objective of this research was to determine the practicality of utilizing thermal infrared imagery and color infrared photography for assessing irrigation water management problems. A field survey of the area covered by the overflights was used to map patterns of fields and irrigation methods. Data gathered through farm interviews, ground-based measurements, and imagery and aerial photographic interpretation were statistically treated. The results of this research demonstrate the practicality of using thermal infrared imagery and color infrared photography for detecting problems associated with the irrigation water management system. The thermal infrared imagery was useful for detecting canal leakage, non-uniformity of water distribution at all stages of crop growth, and apparent crop canopy temperatures as an indicator of crop stress. The color infrared photography was useful for detecting crop stress resulting from a variety of field conditions. (Sinha-OEIS)

THE USE OF DIALYZING SACKS IN ESTIMATION OF PRODUCTION OF BACTERIOPLANKTON AND PHYTOPLANKTON,

Eotvos Lorand Univ., Budapest (Hungary). Dept. of Plant Systematics and Ecology.
L. G. Toth.
Archiv fur Hydrobiologie, Vol 89, No 4, p 474-482, August, 1980. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Phytoplankton, *Bacteria, *Productivity, Dialyzing sacks, Plankton, Zooplankton, Population dynamics, Incubation, Mortality, Predation, Lakes, *Lake Balaton, *Hungary.

Semipermeable dialyzing sacks and glass bottles were compared as means of estimating production of pelagic microflora in Lake Balaton, Hungary, during the summer of 1978. The glass bottle technique produced underestimates of 6.9% in bacterial cells alone, 60.0% in colonized bacteria, 45.5% in total bacterioplankton, 27.2% in microalgae, 42.4% in algae larger than 10 microns, and 40% in total phytoplankton. The matter balance of phytoplankton was determined for the period between 10 a.m. and 4 p.m. as follows: loss to predation, 11.1%; residual mortality, 27.4%; fraction of biomass appearing in actual biomass, 61.5%. The matter balance of bacterioplankton was as follows: loss to predation, 10.1%; residual mortality, 67.5%; and fraction appearing in actual biomass, 22.4%. A schematic representation of the matter-energy flow system between the phytoplankton and bacteria is depicted. (Cassar-FRC)

INSTRUMENTATION FOR AERATED FLOW ON SPILLWAYS,

Ministry of Energy, Wellington (New Zealand).
P. Cain, and I. R. Wood.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1407-1424, November, 1981. 11 Fig, 2 Tab, 13 Ref.

Descriptors: *Spillways, *Measuring instruments, Aeration, Dams, Aviemore Dam, New Zealand, Bubbles.

A study was made of instruments used for measuring air concentration and velocities in self-aerated flow on the spillway of Aviemore Dam. Self-aeration in open channel flow is the natural phenomenon whereby atmospheric air is drawn into and mixed with the water, creating a characteristic white appearance. Measurements in very aerated regions of flow on the spillway of Aviemore dam indicate that surface regions are very highly aerated, with air concentrations in the range of [illegible] to 0.9 (defined as the volume of air/unit volume). Largest bubbles in this surface region are about 10 mm - 20 mm in diameter. Away from the surface the flow is less aerated and bubbles are smaller. Methods for measuring stagnation pressure and air concentration are considered. Descriptions are offered of the operation of a bubble size probe and a correlation velocity probe. The most accurate and reliable measurements obtained at Aviemore were those made using the conductivity portion of the combined probe for air concentration and the correlation probe for velocity. However, in future measurements a single resistivity probe would be used for air concentration. (Baker-FRC)

CONSTRUCTION OF A GAMMA-DISTRIBUTION PROBABILITY PAPER FOR STRAIGHTENING DISCHARGE PROBABILITY CURVES,

F. F. Razzorenov.
Hydrotechnical Construction, No 5, p 471-474, May, 1980. 3 Fig, 2 Tab, 5 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 5, p 23-25, May, 1980.

Descriptors: *Probability distribution, *Hydrologic data, *Flow discharge, Flow rates, Mathematical studies, Discharge measurement, *Streamflow forecasting, *Discharge hydrographs.

The Hazen probability method used to plot discharge probability curves makes it possible to represent the probability curve as a straight line only in the case of a normal distribution of the series. When the data are skewed, the curve is bent. For skewed data, a special gamma-distribution probability method should be used. With this method, it is possible to present the probability curve as a straight line for any values of the coefficeints of variation and skewness. The gamma-distribution method is particularly useful for hydrologic data, as data for large discharges are almost always skewed. Probability curves are presented for the maximum discharges of the Kura River at Likani Village plotted using the Hazen method and the gamma-distribution method. The gamma-distribution method is judged more successful. (Small-FRC)

A RATE OF RISE CONTROLLER FOR AUTOMATIC WATER SAMPLERS,

Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Forest Research.
E. M. O'Loughlin.
Journal of Hydrology, Vol 50, No 1-3, p 383-387, March, 1981. 1 Fig, 1 Ref.

Descriptors: *Sampling, *Water sampling, *Control systems, *Automation, Water quality, Streams.

A controller was developed to actuate an automatic water sampler for streams such that the sampling interval increases in direct proportion to the rate of change of water level and is independent of absolute discharge. This results in more frequent sampling during periods of more variable water quality. The controller features simple construction, low power consumption, variable sensitivity, and low cost. EVALUATION OF REMOTE SENSING DATA FOR INPUT INTO HYDROLOGICAL SIMULATION PROGRAM-FORTRAN (HSPF),

Hydrocomp, Inc., Mountain View, CA.
D. D. Franz, and S. M. Lieu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-209561, Price codes: A06 in paper copy, A01 in microfiche. Environmental Protection Agency Project Summary EPA-600/S3-81-037, July, 1981. 2 p.

Descriptors: *Hydrologic models, *Remote sensing, *Satellite technology, *Computer models, Model studies, Simulation, Land use, Flow rate, Water temperature, Dissolved oxygen.

Remotely sensed data from the LANDSAT satellite and conventionally obtained data were used to set up the input parameters of HSPF. Simulations were then run to compare the model outputs from the two sets of input data. The remotely sensed data set performed at least as well as the conventional one when model results were compared with observed data. Differences in land-use distribution had little effect on the overall outcome of HSPF modeling. Both the conventional and the remotely sensed parameter sets performed well for certain simulations. The results for flow rate, water temperature, and dissolved oxygen are comparable to observed data. Neither parameter set seemed to perform well in nutrient simulations. Assessing the accuracy of these results, however, was difficult because of inadequacies in the observed data and the modeling approach. Refinement of information on urban and water areas in the remotely sensed land-use classification would result in better segment definition. Use of a remotely sensed database offers significant savings in cost (about 30 to 50%) in comparison with use of a conventional database. A remotely sensed database offers advantages of repeatability, relative rapidity and ease of information collection. It would be particularly advantageous in large or inaccessible areas or in areas requiring frequent database updates. The Image Based Information System (IBIS) used to manipulate the Landsat data was found to contribute significantly to the data collection and handling process. (Moore-SRC)

MISCELLANEOUS SURFACE-WATER DATA, PECOS RIVER BASIN, NEW MEXICO,
Geological Survey, Pasco, WA. Water Resources Div.
C. C. Cranston, G. E. Kues, and G. E. Welder.
Geological Survey, Open-File Report 81-218, February, 1981. 8 p, 1 Fig, 1 Tab.

Descriptors: *Surface water, *Surface runoff, *Hydrologic data, Tributaries, Streamflow, Discharge measurement, Springs, Canals, Pumping, *New Mexico, *Pecos River basins, Mapping.

Miscellaneous surface-water data from the Pecos River basin of New Mexico are assembled into one table. Measurements and estimates of the discharge of streams, springs, and diversion canals and pumps that are not readily available to the public are given. The principal sources of information are published and unpublished reports and various records of the U.S. Geological Survey and the New Mexico State Engineer Office. Many thousands of surface-water discharge values are given. (USGS)

DRAINAGE AREAS OF STREAMS AT SELECTED LOCATIONS IN KENTUCKY,
Geological Survey, Louisville, KY. Water Resources Div.
D. E. Bower, and W. H. Jackson.
Geological Survey Open-File Report 81-61, 1981. 118 p, 1 Fig, 12 Tab.

Descriptors: *Hydrologic data, *Surface water, *River basins, *Drainage area, Streams, Streamflow, Sites, Sinks, *Kentucky, Ohio River basin, Lower Mississippi River basin, Watersheds.

The drainage areas for more than 2,000 selected sites throughout Kentucky were determined. Areas of limestone terrain characterized by sinkholes are indicated in basins where they have been determined. Each location is referenced by U.S. Geological Survey station number (where assigned), latitude, longitude, county code, topographic quadrangle, river distance, and in some cases by nearby town or landmark. All values are given in both English and metric units and an alphabetical index by stream name is provided. (USGS)

WATER RESOURCES DATA FOR ALASKA, WATER YEAR 1960.
Geological Survey, Anchorage, AK. Water Resources Div.
Geological Survey Water-Data Report AK-80-1, 1981. 373 p, 4 Fig.

Descriptors: *Hydrologic data, *Surface water, Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Alaska.

Water resources data for the 1980 water year for Alaska consist of records of stage, discharge, and water quality of streams; stage and water quality of lakes; and water levels and water quality in wells and springs. This report contains discharge records for 114 gaging stations, stage only record for 1 gaging station, water quality for 55 stations, and water levels for 33 observation wells. Also included are 56 low-flow, 8 crest-stage, and 2 water-quality partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements of discharge, lake stage, or water quality. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Alaska. (USGS)

WATER RESOURCES DATA FOR WYOMING, WATER YEAR 1980–VOLUME 1, MISSOURI RIVER BASIN.
Geological Survey, Cheyenne, WY. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-153024, Price codes: A99 in paper copy, A01 in microfiche. Geological Survey Water-Data Report WY-80-1, 1981. 621 p, 9 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Wyoming, *Missouri River Basin.

Water Resources data for the 1980 water year for Wyoming consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. Volume 1 of this report contains discharge records for 161 gaging stations; stage only records for 1 lake; stage and contents for 11 lakes and reservoirs; water quality for 93 gaging stations, 44 ungaged stations, 100 wells and springs; and water levels for 36 observation wells. Also included are 74 crest-stage partial-record stations and 2 precipitation monitoring sites. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. This data represents that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Wyoming. (USGS)
W82-02846

WATER RESOURCES DATA FOR MISSISSIPPI, WATER YEAR 1980,
Geological Survey, Jackson, MS. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-149006, Price codes: A18 in paper copy, A01 in microfiche. Geological Survey Water-Data Report MS-80-1, 1981. 414 p, 5 Fig.

Descriptors: *Hydrologic data, *Surface water, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Wells, Water level, Data collections, Sites, *Mississippi.

Water resources data for the 1980 water year for Mississippi consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground-water wells. This report contains records of water discharge at 82 gaging stations, stage records for 17 of these gaging stations, stage only at 4 gaging stations, contents for 4 lakes, water quality for 32 gaging stations and 105 wells, and water levels for 360 observation wells. Also included are peak-discharge data for 94 crest-stage partial-record stations and water quality data at 19 partial record or miscellaneous sites. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Mississippi. (USGS)

FUNDAMENTAL CONCEPTS OF WELL DESIGN,
Ground Water Associates, Inc., Westerville, OH.
E. B. Williams.
Ground Water, Vol 19, No 5, p 527-542, September/October, 1981. 7 Fig, 1 Tab, 28 Ref.

Descriptors: *Well hydraulics, *Design criteria, *Well design, Groundwater movement, Well screens, Screened wells, Geohydrology, Hydraulic conductivity, Reynolds Number, Turbulent flow, Aquifer characteristics, Filters.

Proper well design should rely on more than a knowledge of aquifer properties and screen entrance velocity. The most important factor is proper sizing of the artificial gravel filter materials and screen slot openings. The critical approach velocity, valuable in determining the borehole diameter, may be obtained from the relationship between the hydraulic conductivity and the gradient in the aquifer and from aquifer grain size. The tendency for turbulent flow, described by the Reynolds Number, is used to determine screen diameter. Screen entrance velocity is useful in evaluating open area in regard to screen construction. Graphs and tables are presented to help in the design process. (Cassar-FRC)

RATIONAL DIMENSIONS OF AN EARTH BLANKET AND ITS SEEPAGE CALCULATION,
N. S. Chyong.
Hydrotechnical Construction, No 3, p 256-262, March, 1980. 4 Fig, 6 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 28-31, March, 1980.

Descriptors: *Earthworks, *Hydraulic structures, *Estimating equations, *Seepage, Mathematical studies, Permeability, Earth dams, Dam construction.

A method for determining the optimal thickness and length of a rational earth blanket for hydraulic

structures is presented. This method considers preservation of a prescribed seepage discharge and a permissible value of the gradient of seepage head in the foundation of the structure. The use of a blanket of constant or almost constant thickness is irrational because in one region the cutoff capacity of the blanket may be excessive and in another the gradient of the head may be greater than the permissible limit. Thus piping can occur. Equations are presented for determining the thickness of the blanket over its entire length. (Small-FRC)
W82-02666

IMPROVEMENT OF THE SEALS OF EXPANSION JOINTS OF HYDRAULIC STRUCTURES,

N. F. Shchavelev.
Hydrotechnical Construction, No 3, p 230-236, March, 1980. 4 Fig, 2 Tab, 5 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 12-16, March, 1980.

Descriptors: *Construction joints, *Hydraulic structures, *Performance evaluation, *Sealants, Leakage, Dam construction.

The degree of reliability of existing seals of expansion joints was established by analyzing data on seal performance at 220 operating Soviet and other hydraulic structures. This investigation led to the development of several fundamentally different new seal designs. In expansion and filled expansion-settlement joints, the penetration of the asphalt material from the cavity of the water stop into the joint is a slow process. If the joint is filled flowing from the water stop, water-tightness is increased. There are frequently problems with the installation of contour seals at locations where the joints intersect various service rooms in an underground part. If the existing main seal in the joint protects these rooms from water entry, additional seals are not necessary. These suggestions can increase the efficiency of seals used in the expansion joints of large concrete and reinforced concrete hydraulic structures. (Small-FRC)
W82-02669

USE OF CRACK-RESISTANT LININGS OF HYDRAULIC TUNNELS WITH CONSOLIDATION GROUTING OF THE ROCK,

E. I. Zhokhov, and A. K. Fedulov.
Hydrotechnical Construction, No 3, p 225-229, March, 1980. 1 Fig, 1 Tab, 6 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 9-12, March, 1980.

Descriptors: *Tunnel linings, *Tunnel construction, *Grouting, Tunneling, Tunnels, Seepage control.

High-pressure grouting can be used to create crack-resistant linings in hydraulic pressure tunnels. This method uses less materials than other lining techniques, decreases seepage leaks from the tunnel, and prevents hydrostation production losses. It is best to use the method in circular tunnels of not more than 5-6 m diameter. Many holes can be simultaneously grouted as the grout flows along the return pipeline. Laboratory and on-site investigations are necessary to select the optimum grout formula and to evaluate the effectiveness of grouting under the specific geological conditions of the tunnel. A disadvantage of the method is the large amount of labor required. (Small-FRC)
W82-02670

BITUMINOUS CONCRETE ANTISEEPAGE CURTAIN FOR CONCRETE DAMS,

N. F. Shchavelev.
Hydrotechnical Construction, No 6, p 561-566, June, 1980. 4 Fig, 2 Tab, 7 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 6, p 12-15, June, 1980.

Descriptors: *Asphaltic concrete, *Seepage control, *Dam design, Concrete dams, *Materials engineering, Hydraulic structures, Waterproofing, Insulation, Fiberglass, Pressure distribution, Deformation, *USSR.

A poured porous clay-asphalt concrete is suggested as a waterproofing curtain to protect the upstream face of a dam. The material is a mixture of asphalt (17.4%) with 5-10 mm porous clayey gravel (25%), 0-5 mm porous clay sand (20.5%), rubber crumb (0.6%), and a powdered mineral filler (36.5%) composed of limestone, dolomite, and waste cement. The mixture is self-sealing, easy to handle during construction, and also serves as thermal insulation. The deformation and pressure propagation in the asphaltic material was investigated. For a curtain with a 10 cm thick reinforced concrete wall and anchors 2[illegible] mm in diameter, 60 x 60 cm on centers, the internal presure in the insulating layer is adequate when the structure is first placed in service and increases by 0.025 MPa at 5 years and by 0.220 MPa at 100 years after filling. With a thinner reinforced concrete wall, smaller anchors, or fiberglass insulation, internal pressure increases are smaller or imperceptible. (Cassar-FRC)
W82-02690

PROSPECTS OF USING RADIAL GATES ON OVERFLOW DAMS OF LARGE HYDROELECTRIC STATIONS,

D. M. Savin.
Hydrotechnical Construction, No 3, p 241-244, March, 1980. 2 Fig, 3 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 19-21, March, 1980.

Descriptors: *Hydraulic gates, *Hydroelectric plants, *Dam design, Gates, *Radial gates, Piers, Overflow, Design criteria, Hydraulic structures, Mechanical equipment, Spillways.

Radial gates have several advantages over vertical lift gates in overflow dams: smaller forces required for maneuvering, more reliable seating on the sill, absence of grooves which may fill with ice, and better conditions for passage of ice. However, the large concentrated loads transmitted from the main pivots to the concrete limit the load on each hinge of 5000 kN unless other design modifications are made (larger piers, longer spillways). In several dams throughout the world transmission of larger loads, on the order of 15,000-20,000 kN from each gate hinge, has been accomplished with prestressed cables. A load of 50,000 kN per hinge can be handled by a double-cantilever radial gate supported on intermediate piers without using any prestressed cables, according to a design for the Bureya hydroelectric station. ESTIMATION AND OPTIMIZATION OF THE SERVICEABILITY OF UNDERGROUND WATER TRANSMISSION NETWORK SYSTEMS UNDER SEISMIC RISK,

Columbia Univ., New York.
R. Y. Tan.
PhD Dissertaion, 1980. 81 p, 22 Fig, 7 Tab, 21 Ref. University Microfilms International, Ann Arbor, MI; Order No GAX81-13563.

Descriptors: *Water distribution, *Water conveyance, *Water mains, Network design, Seismic waves, Earthquakes, California, Underground water transmission system.

The purpose of this research is (a) to develop a methodology for the assessment of the risk underground water transmission systems in seismically active areas are subjected to in terms of the degree of possible unserviceability resulting from destructive earthquakes and also (b) to develop procedures for the optimum design of systems to be newly constructed as well as for the optimum improvement of existing systems on the basis of cost-effectiveness considerations. For the analysis, a water transmission system adapted from the actual Los Angeles City system was used, taking into account the existence of the major faults surrounding and penetrating the system, the topological and structural characteristics of the water transmission network, conditions of the soil and ground in which the system is imbedded, and the probabilistic nature of the location, frequency and magnitude of future earthquakes. A Monte Carlo technique was used to simulate a sample of damaged states of the transmission network. The Newton-Raphson method was then utilized to analyze each of the damaged states of the network for its flow characteristics. The result of this analysis determines whether or not the network remains serviceable under each simulated state of damage and hence leads to a Monte Carlo estimation of the probability of system serviceability. Procedures for optimizing the total cost are developed in which the pipe diameters and the network topology are parameters which can be varied to achieve a maximum total cost under certain realistic constraints. (Sinha-OEIS)

CONSTRUCTION OF A BASIC-GATE UNIT FOR THE DEEP CATASTROPHIC SLUICE AT THE NUREK HYDROELECTRIC PLANT,

F. I. Gurtovnik, S. V. Shutenkov, and A. K. Mel'nikov.
Hydrotechnical Construction, No 6, p 556-560, June, 1980. 4 Fig, 6 Ref. Translated from Gidroteknicheskoe Stroitel'stvo, No 6, p 9-12, June, 1980.

Descriptors: *Sluice gates, *Hydroelectric plants, Power plants, Sluices, *Flood control, Channels, Conduits, Electric power, Hydraulic engineering, Reinforced concrete, *Reservoir releases, Construction, Design criteria, Nurek hydroelectric plant, *Russia.

The deep catastrophic sluice at the Nurek hydroelectric plant is a 1337 meter long trough-shaped tunnel with a section varying from 90 to 115 square meters and an inlet portal 100 meters below the reservoir's normal support level. The sluice is designed to discharge flood flows of up to 2000 cubic meters per second, with a full reservoir during the period when the hydraulic facility is in operation. The sluice will also discharge construction flows during the concluding stages of construction on the basic structures. Due to special conditions prevailing at the time of construction, a temporary scheme for maneuvering the basic sluice gates was devised. The temporary scheme was needed primarily to ensure operation to some degree when the flood season was imminent. Construction was completed in time for the floods due to a reduction in the volume of construction-assembly work and a shortening of construction times. The construction of supports for the underground working-gate unit in sectional reinforced concrete made it possible to reduce the time needed for construction of the unit due to the concurrent construction-assembly operations. The adoption of reinforced-concrete support designs in combination with anchors enabled the builders to deviate from the traditional method employed to build similar units using reinforced concrete arches. (Baker-FRC)
W82-02771

ON-SITE INVESTIGATIONS OF THE CONTACT ZONE OF THE UPSTREAM FACE OF THE CONCRETE DAM ON THE UST-ILIM HYDROELECTRIC STATION,

V. N. Durcheva, and S. M. Puchkova.
Hydrotechnical Construction, No 6, p 595-600, June, 1980. 3 Fig, 2 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 6, p 32-35, June, 1980.

Descriptors: *Dams, *Hydroelectric plants, *Concrete, Powerplants, Construction, Spillways, Strain measurement, Reservoir filling, *Temperature effects, Dam design, Ust-Ilim Dam, *Russia.

The Ust-Ilim concrete dam has a maximum height of 105 meters, slope of the downstream face 1:0.7, and was constructed on a strong diabase foundation. The channel part of the upstream face of the dam is formed by 36 sections: 18 powerhouse, 11 spillway, and 7 nonoverflow. Vertical strain

gauges were installed at a distance of 0.5 meters from the upstream face in the axial cross section along the base of each half-section. The conditions present at the contact zone under the upstream face depend on the design features of the sections and temperature regime during filling of the reservoir. The maximum propagation of the contact crack to 13 meters occurred in the powerhouse sections before linking to the powerhouse with open conduits that communicated with the outside air. For theoretical studies of the boundaries of decompression of the foundation of the contact zone under the upstream face of a gravity dam it is necessary to consider stresses during the construction period, the effect of the shape of the offset profile, and the temperature regime of various types of sections. Vertical cracks in the concrete of the contact slab of temporary dewatering outlets can become paths of concentrated seepage. The design features of spillway sections caused a state of three-dimensional stress of the contact zone, with transmission of the loads of the construction period and during filling of the reservoir. In the majority of drain wells, the water level is at the level of the rock-concrete contact joint. Flowing wells and flow of water through transverse drainage galleries are observed only in several powerhouse sections. Wells are also flowing in several spillway sections. Seepage flow through the rock foundation is not being monitored. (Baker-FRC)

STUDY OF THE EXPERIENCE IN OPERATING HYDRAULIC TUNNELS,

V. M. Mostkov, and V. S. Serkov.
Hydrotechnical Construction, No 1, p 44-49, January, 1980. 4 Ref. Translated from Gidroteknicheskoe Stroitel'stvo, No 1, p 26-28, January, 1980.

Descriptors: *Tunnel linings, *Hydroelectric plants, *Inspection, Hydraulic structures, Tunnel failure, Design criteria, Concrete construction, Linings, Cracks, Damage, Diversion structures, Grouting, Corrosion, *USSR.

Most of the 300 km of pressure and free flow hydraulic tunnels operating in the Soviet Union have been in satisfactory condition, according to inspections begun in 1972. Several cases of deterioration are reported. Typical is the Tereblya-Rika pressure diversion tunnel, which showed waterlogging and slope deformation along the tunnel route. These conditions were caused by cracks in the concrete lining and a circular crack at the connection with the metal lining of the penstock. Repairs included injection of cement grout, sealing of the circular crack, and reinforcement of the cracked lining with a 70 m metal sleeve. There are three main causes of damage to tunnels: incorrect evaluation of rock mass properties during design, deviations from specifications during construction, and corrosion during operation. Since the physical properties of rock masses are very difficult to predict, it is suggested that characteristics of the same rock mass be measured before and after operation of the tunnel. The differences can be used in design of analogous tunnels. Common construction deviations from specification include insufficient cleaning of the rock surface before concreting the lining, errors and low-quality ingredients in mixing concrete, untimely placement of concrete, inadequate compacting of the concrete mix, inadequate grouting, and unclean reinforcement material. A systematic analysis of tunnel operating experiences is needed. (Cassar-FRC)

CALCULATION OF DIVERSION TUNNELS OF SPECIAL PROFILES OPERATING UNDER CONDITIONS OF A FREE UNIFORM FLOW,

V. N. Kozin.
Hydrotechnical Construction, No 4, p 392-394, April, 1980. 1 Fig, 2 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 4, p 40-41, April, 1980.

Descriptors: *Tunnel hydraulics, *Diversion structures, Graphical methods, Mathematical equations, Discharge capacity, Uniform flow, Turbulent flow, Design criteria, Diversion structures, *USSR.

The dimensions and the velocity and depth of a uniform flow in a horseshoe diversion tunnel are calculated from the height, discharge, degree of filling, and roughness coefficient. This is a more difficult computation than the inverse solution, determining discharge capacity from tunnel dimensions. The determination is based on a classification of diversion tunnels into 5 profiles by the USSR agency concerned with hydroelectric station construction. A graph represents characteristics of the cross-section and hydraulic radius for different degrees of filling. These values are used in equations to calculate the desired parameters. This procedure may be used to develop graphs for other tunnel profiles. (Cassar-FRC)

STRESS RELAXATION IN CONCRETE OF MASSIVE HYDRAULIC STRUCTURES,

E. A. Kogan.
Hydrotechnical Construction, No 9, p 916-920, September, 1980. 4 Fig, 2 Tab, 12 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 9, p 24-27, September, 1980.

Descriptors: *Concrete technology, *Stress relaxation coefficient, Hydraulic structures, Materials enginering, Dam design, Hydroelectric plants, *Dam construction, *USSR.

Experimental values of the stress relaxation coefficient (Kr) were obtained by testing large-scale concrete specimens, 50-70 cm wide and 200-220 cm high. These were prepared with concrete mixes (grades 200, 300 and 450) from dams under construction in the USSR. Families of curves are presented for Kr at different ages of concrete, up to 200 days. A table gives coefficients for 300 grade concrete of ages 1 to 900 days at concrete ages of 1 to 720 days at the time of stress increase. Concrete age substantially affects the degree of stress relaxation, differing by a factor of 2-3 between 3 and 500 days, and must be considered up to at least 180 days. At an age of 3 days, limiting values of Kr for concrete of all three grades are close to 0.25. Mature concrete is characterized by Kr limiting values of 0.54 for grade 200 and 0.64-0.67 for grades 300 and 450. (Cassar-FRC)

ARGENTINA'S HYDROELECTRIC-BASED ENERGY PLAN,

H. Bronstein.
Power Engineering, Vol 85, No 1, p 50-51, January, 1981. 1 Fig, 1 Tab.

Descriptors: *Electrical networks, *Hydroelectric power, *Water resources development, Dams, Electric power production, Nuclear energy, Electric powerplants, Thermal power plants, Hydroelectric plants, Thermal power, *Argentina.

Argentina's new energy program, designed to reduce dependence on petroleum, will rely on 21 planned hydroelectric powerplants. The new plants are expected to be built at a cost of $22 billion by the year 2000. Six nuclear powerplants will be constructed as a backup system, and the country's present transmission system will expand to 10,900 miles by 1995. Argentina's rivers have a potential electric power source of about 140,000 GWh. Hydroelectric power will account for 25,000 additional MW by the year 2000; the current production is 9300 MW. In 1995 conventional thermal plants will supply 61% of the electricity needs while nuclear power will provide 10%. The $5.7-billion Yacyreta project and the Corpus project are joint Argentine-Paraguayan ventures. The Parana Medio complex, downstream from the Yacyreta, will contain two hydroplants with a combined installed capacity of 5600 MW. Other projects are being planned at the Pati section, Chapeton. The five hydro projects are slated for the Limay River. Eight smaller hydroelectric projects having a total installed capacity of 2200 MW will supply electricity to the western provinces of Mendoza and San Juan. Most of the projects will be financed from supplier creditors and maintained by semi-private utilities. The government hopes to generate international interest in expanding its water resources through international public tenders for these projects. (Geiger-FRC)

STAGES OF PROGRESS IN THE ORGANIZATION OF HYDRAULIC CONSTRUCTION,

Main Administration for Construction and Installation of Hydroelectric Power Plants in the East (USSR).
V. L. Kuperman.
Hydrotechnical Construction, No 10, p 1027-1035, October, 1980. 3 Fig, 31 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 10, p 23-27, October, 1980.

Descriptors: *Construction, *Hydraulic engineerings, *USSR, Dam construction, Reservoir construction, Construction materials, Hydraulic design, Hydraulic structures, Permafrost, Frozen ground, Earth dams.

In the initial period of water-power construction in the USSR, water power was based on fundamental studies of prominent Russian scientists of the prerevolutionary period and on foreign experience and techniques in practical matters. Later development differed markedly from experiences gained elsewhere. Considering the complexity of the construction problems, the subdivision on water power construction was created in the system of the Main Administration for the Electrification of Russia. Initially hydroelectric plants were built on small mountain rivers in Central Asia, Caucasia, the Kola Peninsula, and in other regions on the basis of the derivation scheme. Later, highly economical derivation hydroelectric plants and networks were built on mountain rivers. The experience gained with the construction of the first relatively low-head hydroelectric plants in Siberia, the Ust-Kamenogorsk, Novosibirsk, and Irkutsk plants, has made it possible to proceed with the construction of hydroelectric plants with dams built of local materials in permafrost regions. Especially in regions with permafrost, dams built of local earthen materials with the underground disposition of power structures have been found most economical. The world's largest arch dams were designed for the Inguri and Chirkey hydroelectric plants. The presence of complex geologic conditions and local building materials made it possible to derive the optimum solution using dams constructed of earthen materials. The 300 meter high dam for the Nurek hydroelectric plant is being constructed of a gravelly conglomerate material with an antiseepage core formed from a sandy-loam material. (Baker-FRC)

UMFOLOZI ROAD BRIDGE HYDRAULIC MODEL INVESTIGATION,

National Research Inst. for Oceanology, Stellenbosch (South Africa).
J. A. Zwamborn.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1317-1333, November, 1981. 15 Fig, 11 Ref.

Descriptors: *Model studies, *Bridges, Hydraulic models, Rivers, Sediments, Scour, Abrasion, Erosion, *Bridge design, *Umfolozi River, Zululand, *South Africa.

A movable-bed hydraulic model study is described which was made to determine the optimum position, length, and pier alignment of a new road bridge across the Umfolozi River in Zululand, South Africa. The model scaling techniques were proved efficiently correct by reproducing, in the model, recorded scour depths and general river bed changes caused by a major flood. The study showed that the originally proposed bridge site had serious disadvantages, and a much better site was established. The required bridge length was reduced from 1,200 ft to 700 ft. In addition to the savings in bridge length, the study resulted in a considerable saving on the foundation depth, due to the reliable scour depth predictions obtained from the movable-bed model. The model was designed in accordance with the shear/settling velocity criterion, and crushed anthracite was used as

bed material. The horizontal and vertical scales were 1 in 250 and 1 in 100 respectively. The velocity scale was based on Froude's law and, with the large tractive force in this steep river, it was necessary to deviate from the criterion. (Baker-FRC)

EXPERIENCE WITH AND THE EFFECTIVENESS OF AUTOMATIC SYSTEMS FOR CONTROL OF LOADING-HAULING OPERATIONS DURING CONSTRUCTION OF THE DAM FOR NUREK HYDROELECTRIC PLANT,

S. Ya. Lashchenov, V. I. Rymarevich, V. V. Vil'vovskii, and M. Yu. Gornshtein.
Hydrotechnical Construction, No 11, p 1109-1114, November, 1980. 2 Tab. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 11, p 6-9, November, 1980.

Descriptors: *Hydroelectric plants, *Dam construction, *Control systems, Construction, Rock fill, Earth dams, Automation, Computers, Data processing, Hydraulic engineering, Quarries, *Nurek hydroelectric plant, *USSR.

The Karat automatic system for control of loading-hauling operations was used effectively in the construction of the high earth dam for the Nurek hydroelectric plant (300 m high and 52 million cu m in volume). The system is designed for 256 dump trucks, 3 weighing stations, and 19 loading-unloading stations. It secures trucks for the loading-unloading stations, automatically weighs vehicles in transit, conveys loading-unloading locations to drivers, totals volumes loaded and discharged, and records statistics connected with each truck. All data is stored on perforated tape, which is processed in a computer to provide further information on performance, wages, materials handled, etc. The control method improved efficiency by 88-98%. CONSTRUCTION OF THE DIVERSION PRESSURE TUNNEL OF THE INGURI HYDROELECTRIC STATION,

L. S. Gabuniya, and G. Ya. Zarandiya.
Hydrotechnical Construction, No 2, p 122-130, February, 1980. 4 Fig, 1 Tab. Translated from Gidroteknicheskoe Stroitel'stvo, No 2, p 9-13, February, 1980.

Descriptors: *Tunnel construction, *Hydroelectric plants, Tunnel linings, Tunneling, Concrete construction, Linings, Karst hydrology, *Inguri River, Diversion structures, Construction, Engineering, Civil engineering, *USSR.

The Inguri hydroelectric station tunnel is unique among Soviet hydraulic tunnels with respect to size and head. The diversion pressure tunnel, 15.05 km long and 9.5 m in diameter, has a head at the start of 105 m and at the end, 165 m. Design discharge is 430 cu m per sec and slope 0.0038. Two arch bridges convey metal conduits across two gorges. Construction began in 1963 and was completed in 1978. The work was slowed during the first years by 43 karst formations, inflow of subsurface waters at up to 800 liters per sec, and heavy precipitation. As work proceeded, methods and equipment were modified to improve efficiency. In strong, slightly fractured rocks, the lining was lightly reinforced concrete 0.5 m thick, with grouting of rocks to 6-10 m at a pressure of 4 MPa. Severely fractured rocks were lined with load bearing reinforced concrete 0.5-0.8 m thick with grouting of rocks to 6 m under 3.5-4MPa pressure. In crushed rocks a combined lining was used, with an outside concrete ring 0.8-1 m thick and inside steel shell 25-40 mm thick. Rock grouting was done to 3 m under 3.5 MPa. Drilling, blasting, installation of linings, and grouting are described in detail. Techniques especially useful for this project were use of a drilling frame, increased depth of shot holes, mechanized travelling concrete form units, drilling-grouting frames, and assembling the metal facing without a turnover device. (Cassar-FRC)

PROGRESSIVE SOLUTIONS IN THE DESIGN OF UNDER-GROUND STRUCTURES FOR THE ROGUN HYDROELECTRIC PLANT,

L. G. Osadchii, V. F. Ilyushin, and I. S. Bubman.
Hydrotechnical Construction, No 6, p 546-555, June, 1980. 5 Fig, 3 Tab, 1 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 6, p 3-9, June, 1980.

Descriptors: *Hydroelectric plants, *Underground structures, Excavation, Design criteria, Construction, Mechanical equipment, *Tunnel construction, Sluices, Conduits, Tunnel linings, Intakes, Seepage control, Explosives.

Plans for construction of the Rogun hydroelectric plant underground complex were modified to produce a proposed savings of 30% in construction rate. The 60 km of underground structures included a powerhouse, construction tunnels, sluices, structures to protect the salt stratum, structures to protect agricultural land, and service tunnels. Some of the innovative solutions were spiral motor transport tunnels, auxiliary galleries built in connection with large span excavations, a truck fleet composed of both light and heavy duty vehicles, preliminary strengthening of disturbed rock sections, protection of the salt stratum by freezing, contour blasting, two-stage opening of vertical excavations, mechanization of mining and tunneling, and central concrete mixing plant. CLOSURE OF THE KAMA RIVER AT THE SITE OF THE LOWER KAMA HYDROELECTRIC PLANT,

V. I. Astafichev, M. L. Neminskii, S. V. Novatorov, and K. V. Korchits.
Hydrotechnical Construction, No 4, p 351-358, April, 1980. 4 Fig, 1 Tab. Translated from Gidroteknicheskoe Stroitel'stvo, No 4, p 15-20, April, 1980.

Descriptors: *Dam construction, *Channel scour, *Hydroelectric plants, Rivers, *Kama River, *USSR, Channels, Engineering, Civil engineering.

The Kama River (500 m wide, 7-11 m deep, and 5 m sandy bottom) was closed in three stages. In the first stage the channel was stabilized with a rock lining 1 m thick, 22,800 sq m in area, and 17,700 cu m in volume. This material was dropped from dump trucks through 512 holes in the ice during the winters of 1977 and 1978. The second stage involved narrowing the channel with a pervious core composed of sand, rock and concrete blocks, with concurrent hydraulicking of the channel dam. Unusually high flows in June and October caused considerable channel scour and slides in the pervious core material. During this period average velocities were 3.4 m per sec: maximum velocity, 4 m per sec at the core. River flows attained 9170 cu meters per sec during the June flood. The trench for the hydroelectric plant was flooded October 25, 1978. Final channel closure began Oct. 17, at which time the opening was 218 meters in the downstream cofferdam, and the river flow was 5360 cu m per sec. On Oct 30 navigation was suspended and the third stage began. The closure, lasting 56 hours, proceeded from both banks at an average of 2.5 m per sec. Crest width averaged 12 m. During this period the river flow was 5000 cu m per sec, twice the design flow. To reduce flow to a reasonable limit, an upstream reservoir output was reduced. As the work progressed, it was obvious that the pervious core method was indeed the most suitable for closure in this situation. The frontal method and closure without a pervious core would have been inexpedient. (Cassar-FRC)

EXPERIENCE IN THE CONSTRUCTION AND FIRST YEARS OF OPERATION OF THE ZEYA DAM,

A. P. Epifanov, V. N. Vagner, V. V. Kon'ko, V. I. Sil'nitskii, and A. M. Chaika.
Hydrotechnical Construction, No 8, p 759-764, August, 1980. 3 Fig, 1 Tab, 4 Ref. Translated from Gidroteknicheskoe Stroitel'stvo, No 8, p 2-5, August, 1980.

Descriptors: *Hydroelectric plants, *Dam construction, *Grouting, Construction, Buttress dams, Hydraulic structures, Concrete construction, Freezing, Temperature.

The Zeya Dam was constructed in 1970-1978 at temperatures from -2.5 to +0.4 C. Mean annual air temperature was -4.1 C, mean January temperature -30.1 C. The butress dam contains hollow sections, which limit penetration of negative temperatures into the concrete. Grouting was facilitated because the concrete quickly cooled to the desired temperatures. Reinforced concrete insulated forms prevented large differences in temperature between the core and exterior face. When the spillway was constructed in 1978, the formwork was left in place for 12-18 hours and then removed so that overdrying and cracking of the surface were minimized. Proper grouting temperatures were achieved by cooling in summer and heating in winter. A method of grouting was worked out so that a stress was maintained on the dam, forcing the support head toward the upper pool. It was found that minimum winterization, to a height of 12-15 m of the contact zone, produced a favorable stress which improved contact between the columns during cooling of the concrete. Maximum water levels were 55.2 m in 1975, 61.2 m in 1976, 69.9 m in 1977, and 76.9 m in 1978. The freeboard is 102 m. (Cassar-FRC)

SELECTING PIPELINES TO ACHIEVE EFFECTIVE ENERGY CONSERVATION,

Freese and Nichols, Fort Worth, TX.
T. A. Reid.
Water and Sewage Works, Vol 127, No 11, p 53, 54, 64, 65, 74, November, 1980. 3 Fig, 2 Tab.

Descriptors: *Cost analysis, *Pipelines, *Energy loss, *Flow friction, Hydraulics, Pipes, Pipe flow, Mathematical studies, Flow, Flow characteristics, Pressure distribution, Water distribution, Friction loss.

A mathematical expression for calculating the 'demand characteristics' of pipelines is presented to examine their energy requirements over their total lifetime. The demand characteristic concept was used to calculate a more realistic estimate of annual energy requirements for the Fort Worth Holly pressure plane and the South Side IIIs pressure plane. By assuming comparable maintenance and labor costs for the pipelines of these two pressure planes and calculating (from unit energy costs and estimated construction costs) an optimum operating flow rate for each particular pipe, the optimum average flow rates for a range of pipe diameters were compared. When the demand characteristic was increased, the magnitude of the optimum flow ranges was decreased. The cost per unit of flow at the optimum flow rate decreased as pipe diameter increased. Frictional head losses were also calculated for each annual optimum flow range. The velocity and frictional head losses associated with maximum flows for the Holly and South Side pressure planes tended to be higher than those designated as acceptable from past experience. Larger pipe diameters were recommended for more satisfactory system operation in both of the Fort Worth study areas. (Geiger-FRC)

Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY10, p 1163-1178, October, 1981. 10 Fig, 3 Tab, 21 Ref.

Descriptors: *Estimating equations, *Boundaries, *Spillways, *Sluices, Flows, Mathematical studies, Hydraulic structures.

The Boundary Integral equation Method (BIEM) was applied in a scheme based on a perturbation principle to provide rapid convergence of the solution to problems of sluice gates and spillways. This technique is a step towards the replacement of physical models with numerical calculations. The procedure for the solution of the sluice gate problem is outlined, and the accuracy and efficiency of the BIEM solution is compared with a recent FEM solution. The efficiency of the BIEM solution in terms of the number of iterations, number of elements, and computation time is clearly superior to the FEM for comparable accuracy. The spillway solution procedure is also outlined. The BIEM results for a standard WES spillway conform closely to the experimental curve. (Small-FRC)

EFFECT OF WAVE SLOPE ON A ROCK MASS IN A REV[illegible]MENT,

M. E. Pla[illegible]
Hydrotec[illegible]al construction, No 9, p 931-936, September, 1980. 1 Fig, 1 Tab, 13 Ref. Translated from Gidrotekhnicheskoe Stroitei'stvo, No 9, p 33-36, September, 1980.

Descriptors: *Wave action, *Retaining walls, *Shore protection, Revetments, Riprap, Breakwaters, Mathematical equations, Hydraulic structures, Rock fill, Slope stabilization.

Fifteen existing formulas for calculating the mass of rock in a riprap revetment of a slope under the effect of waves were analyzed. It was concluded that the rock mass in question is directly proportional to the square root of the wavelength, other conditions being equal. Corrections to the standard equations were suggested for use with wave slopes between 10 and 25, the most commonly encountered values. The corrected equation produced 22-33% smaller estimates of the required rock masses than did the standard equations, especially in the case of short, steep waves. (Cassar-FRC)

IMPULSE TECHNOLOGY FOR SURFACE COMPACTION OF CONCRETE MIXES IN CONSTRUCTION OF SLOPE REVETMENTS,

A. A. Afanas'ev, A. I. Boikov, Yu. G. Trukhin, and V. I. Il'in.
Hydrotechnical Construction, No 11, p 1126-1129, November, 1980. 3 Fig, 2 Tab, 3 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 11, p 16-18, November, 1980.

Descriptors: *Concrete technology, *Compaction, *Slope stabilization, Construction, Revetments, Impulse compaction, Retaining walls, Hydraulic structures, Mechanical equipment, Dams, Dikes.

A method for compaction of stiff concrete mixes using an impulse vibration system has saved time and improved concrete strength in construction of slope revetments. Essentially the procedure consists of transmitting energy impulses to the concrete mix from the top through a live element in the form of plates connected by elastic links. The low-frequency impulses propagated through the mix carry a large energy reserve and cause the mix to be in a state of flow and compaction. Tests showed that maximum compaction effects were reached in the frequency range 15-20 Hz for pulsation amplitudes of 3-5 mm. compaction depth for mixes with a stiffness index of 30 sec was 40-50, and for 60-90 sec stiffness, 30 cm. Examination of samples taken from an experimental concrete strip, weathered for 2 years, showed a porosity of less than 1.4% and an increase in strength of 40%. A 46.8 ton machine was developed for mechanized placement and compaction of concrete mixes on slopes of up to 1:4. This apparatus reduced labor by a factor of 8-10 and reached the required quantity of cement by 5-8%. (Cassar-FRC)

APPLICATION OF RELIABILITY THEORY TO HYDRAULIC ENGINEERING DESIGN,

Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
L. Duckstein, and I. Bogardi.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY7, p 799-815, July, 1981. 3 Fig, 2 Tab, 36 Ref.

Descriptors: *Hydraulics, *Floods, *Probabilistic process, *Statistical analysis, Hydraulic engineering, *Systems analysis, Rivers, Levees, Earthworks, Soil properties, Gaging stations, Peak flow, Soil mechanics, Time series analysis, Carrying capacity, Velocity, Regression models.

The safety of complex hydraulic structures, such as river dams, is analyzed using a probabilistic approach. The approach combines the work of Freudenthal with the work of Cornell and Lind. The proposed approach takes into consideration the stochastic character of flood load, the various degrees of protection along the levee, and the different modes of failure. The probability of failure in a given cross section is calculated, as well as the probability of failure of a levee reach. Both load and resistance are considered as random variables. The probability of failure is then a function of two random variables. High values calculated for the probability of levee failure are in agreement with observed values. (Titus-FRC)

MODELING CAVITATION FOR CLOSED CONDUIT FLOW,

Utah State Univ., Logan. Water Research Lab.
J. P. Tullis.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, HY11, p 1335-1349, 1981. 3 Fig, 3 Tab, 17 Ref.

Descriptors: *Model studies, *Cavitation, Flow, Fluid mechanics, *Closed-conduit flow, Closed systems, Hydraulics, Pipes, Scaling.

A procedure is demonstrated for modeling cavitation for closed conduit flow. A portion of a model study is presented which described the procedure for determining four cavitation limits and how to evaluate and adjust for scale effects. The item tested was a long radius elbow, but the procedure applies to any pipe component or valve used in closed conduit flow. Cavitation limits evaluated are incipient, critical, incipient damage, and choking cavitation. Scale effects associated with change in size and velocity of pressure are evaluated and used to adjust the model data to the prototype conditions. No scale effects related to changes in velocity or pressure are found for any of the four cavitation limits. Incipient and critical cavitation are found to change significantly with size of elbow. For most systems the practical design limit lies between the critical and incipient damage. As one operates beyond the value of the cavitation index, the noise and vibrations increase rapidly. This study determined that the velocities through the prototype system were sufficient to cause the elbows to operate in choking cavitation. (Baker-FRC)

MEASUREMENTS OF SELF-AERATED FLOW ON A SPILLWAY,

Pearson Bridge Ltd, St. Leonards. (Australia).
P. Cain, and I. R. Wood.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 107, No HY11, p 1425-1444, November, 1981. 16 Fig, 3 Tab, 10 Ref.

Descriptors: *Spillways, *Aeration, Dams, Bubbles, Aviemore Dam, Cavitation, Hydraulics, Channels.

Measurements were made on the spillway of a 36 meter high concrete gravity dam. Measurements taken included the point of inception, the velocity distribution and air concentration distribution, as well as bubble size in the developing region of the flow. There appeared to be a universal velocity distribution which was independent of the mean air concentration for average air concentrations of between 0 and 0.5; the air concentration becomes progressively more uniform with distance downstream. At 100 times the depth at the point of inception a significant air concentration has reached the spillway floor. It is noted that, provided the point of inception of air entrainment occurs sufficiently far downstream of the crest, a minor modification of Bauer's work gives direct design formulas. (Baker-FRC)

DISCHARGE CHARACTERISTICS OF TRIANGULAR-NOTCH THIN-PLATE WEIRS,

Geological Survey, Reston, VA. Water Resources Div.
J. Shen.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price: $3.75. Geological Survey Water-Supply Paper 1617-B, 1981. 45 p, 43 Fig, 3 Tab, 32 Ref.

Descriptors: *Weirs, *Hydraulics, *Flow measurement, Discharge coefficient, Natural streams, Laboratories, Mathematical studies, Triangular weirs, V-notch weirs, Streamflow.

The triangular-notch thin-plate weir is a convenient, relatively precise flow-measuring instrument frequently used to measure the flow of water in laboratories and in small streams. A comprehensive analysis of the discharge characteristics of triangular-notch weirs is presented, previously published data are analyzed in the light of the effective-head concept, and a new weir discharge formula is proposed. Coefficients are recommended, requirements for precise measurements are described, and limits of applicability are discussed. An extensive review of the literature of triangular weirs is included. COEFFICIENT OF FRICTION IN CONDUITS WITH LARGE ROUGHNESS,

Hawksley (Watson), High Wycombe (England).
R. Pyle, and P. Novak.
Journal of Hydraulic Research, Vol 19, No 2, p 119-140, 1981. 16 fig, 1 Tab, 18 Ref.

Descriptors: *Friction loss, *Conduits, *Roughness coefficient, Drag, Head loss, Model studies, Mathematical models, Hydraulics, Channel flow.

A mathematical model is presented for computing the friction coefficient of a conduit with roughness elements of any size or shape. No further hydraulic experiments are required to use this method, which is based on coefficient of drag. To gather reference data three conduits with different types of roughness elements (single size spheres, 16.5 mm diameter; single size hemispheres, 33 mm diameter; and natural river stones up to 150 mm) were used. A total of 13 element concentrations were included. A further modification of the model enabled computation of the friction coefficient for the above element shapes as well as for cylinders or prisms of varying sizes and testing on top of each other. The friction coefficient of natural river stones was greater than that obtained from a series of cylinders and less than that obtained from a series of prisms. (Cassar-FRC)

DISTRIBUTION OF WASTEWATER IN DRAIN FIELD PIPES,

Cowiconsult, Virum (Denmark).
R. Wiuff.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 107, No EE5, p 1009-1024, October, 1981. 19 Fig, 1 Tab, 7 Ref.

Descriptors: *Septic tanks, *Drainage engineering, *Wastewater disposal, Percolation, Pipe flow, Hydraulics, Sanitary engineering.

The outflow from a septic tank drain field pipe, fitted with evenly spaced circular holes along the bottom, was analyzed for steady flow conditions and unsteady flow conditions produced by lavatory flushes or bath water disposal. Experiments were carried out on a pipe 10 meters long, 0.094 m diameter, with 18 evenly spaced holes 0.011 m in diameter, and slope up to 2.5%. Under steady flow with maximum discharge and maximum slope, only the first 15 holes discharged. A drain field was designed to accomodate a 210 liter per person per day wastewater system. At a slope of 1% and a pipe length of 12 meters, it was calculated that even spacing of 28 drain holes in the pipe would cause most of the water to drain out within the first 3 or 4 meters. A more even distribution of water would be obtained with 3 holes in the first third, 6 holes in the second third, and 19 holes in the last third. This arrangement would eliminate the need for pumps and siphons. (Cassar-FRC)

NEW JET-GATE DESIGN,

I. E. Mikhailov, and V. I. Bobrov.
Hydrotechnical Construction, No 6, p 571-574, June, 1980. 3 Fig. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 6, p 19-21, June, 1980.

Descriptors: *Flow regulators, *Energy dissipation, *Hydraulic gates, Hydroelectric plants, Flow characteristics, Flow control, Flow discharge, *Gates, Hydraulic structures, High pressure gates, Jet gates, Mixing, Nozzles, Fluid mechanics, Regulated flow, Sluice gates, Construction engineering, Design criteria.

The high head, high capacity jet regulating gate was evaluated in a laboratory model. This type of gate operates at heads of 300 m and greater and dissipates excess energy in the discharge by impacting the jets together in the flow merging chamber. Flow regulation can be accomplished by adjusting the position of the nozzles. Installation of jet gates can substantially reduce costs of hydroelectric plant construction. A model with a cylindrical flow merging chamber, 240 mm in diameter and 250 mm in length, was fitted with 2 nozzles. The two series of runs were done with nozzles wither 30 mm or 40 mm in diameter. Heads ranged from 4 to 200 m, outflows from 2 to 10 m. A family of curves was developed to describe the flow characteristics at each nozzle diameter with different heads and relative gate openings. Smooth flow regulation was obtained at relative gate openings < or = 1.2-1.4. Further increases in gate openings did not change the flow. Gate capacity was not affected by variations in outflow within the range 2-10 m under constant head. Almost all the excess energy of the discharge (> 99%) was dissipated in the flow merging chamber. THE CONE PUMP,

Weir Pumps Ltd., Glasgow (Scotland).
M. Ryall.
Water Services, Vol 85, No 1026, p 394-396, August, 1981.

Descriptors: *Pumps, *Design criteria, Wastewater treatment, Drainage.

A new type of pump is described which is useful for a wide range of low head duties, particularly in land drainage and handling and treatment of sewage. The pump was designed to consider several needs, including minimizing hydraulic friction losses, avoidance of excessive immersion levels in the suction sump at maximum flow, achievement of stable self-regulating flow, reduction of overall diameter to minimize construction cost, simplification of component shapes to reduce tooling costs, pumping of liquids containing solids, and making powder consumption as closely proportional to flow as possible. The pump design is based on the concept of centrifugal force acting on a liquid, which cannot escape in any direction but upwards. The Cone pump performs its required duties reliably over a range of heads and flows similar to the commonly used screw pumps and is lighter, more compact and easier to install. (Baker-FRC)

CALCULATION OF THE STRENGTH OF RIGID DIAPHRAGMS IN EARTH DAMS,

P. D. Evdokimov.
Hydrotechnical Construction, No 3, p 263-267, March, 1980. 2 Fig. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 31-33, March, 1980.

Descriptors: *Earth dams, *Dam stability, *Friction, Strength, Mathematical studies, Estimating equations.

The effect of the earth's frictional forces on the diaphragm surface of earth dams was calculated. All of the normal and tangential forces that act on the diaphragm surface were considered. The first case considered was the horizontal reaction in the foot of the diaphragm, which is less than or equal to the frictional force where the foot is not displaced. The second case considered the horizontal reaction in the foot of the diaphragm when the foot is displaced. In both cases, the frictional forces of the earth on the diaphragm reduced the horizontal reaction of the earth of the downstream shoulder. There was resistance to the horizontal displacement of the diaphragm toward the downstream shoulder of the dam. This increases the stability of the downstream slope of the dam and improves the state of stress of the diaphragm. (Small-FRC)

CALCULATION OF FOUNDATIONS AND EARTH DAMS,

P. D. Evdokimov.
Hydrotechnical Construction, No 4, p 395-398, April, 1980. 4 Fig, 11 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 4, p 41-43, April, 1980.

Descriptors: *Dam stability, *Earth pressure, Soil mechanics, Shear stress, *Earth dams, Clays, Deformation, Pressure distribution.

The forces acting on an earth-rock dam with a clay core are analyzed for three situations: completely stabilized, incompletely stabilized, and completely unstabilized. The resulting diagrams of earth pressure of the downstream shoulder can be used to construct the diagram of moment over the height of the core and the diagram of shearing forces. From these the stressed state of the core can be determined from the equation of nonuniform compression. The degree of stability of the dam can be obtained from the earth pressure of the downstream shoulder and the passive earth pressure of the downstream shoulder. (Cassar-FRC)

COMPUTING THE SETTLEMENT OF THIN ANTISEEPAGE WALLS FORMED FROM CLAYEY SOILS,

V. P. Nedriga, A. M. Gladilin, and I. P. Chernyi.
Hydrotechnical Construction, No 1, p 29-32, January, 1980. 1 Fig, 3 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 17-19, January, 1980.

Descriptors: *Seepage control, *Clays, Soil mechanics, Hydraulic structures, Dams, Mathematical equations.

Expressions are developed to calculate the settlement of fluid clay in an antiseepage wall built within a dam or other hydraulic structures. Settlement in the upper boundary area results from the lateral outflow of filtrate through the edge of the curtain. The properties of the clay material used for filler and of the soil surrounding the structure significantly affected the amount of settlement. The mathematical equation was used on a clay wall 10 m high and 0.15 m thick, with other specified parameters (density of clay, porosity of clay, coefficient of friction between clay and the edge of the curtain, etc.). The computed height after settlement was 9.13 m, or about 9%. This agreed with observations reported in the literature. (Cassar-FRC)

SLOPE FAILURES AND TAILING DAM DAMAGE IN THE 1978 IZU-OHSHIMA-KINKAI EARTHQUAKE,

Tokai Univ., Shizouka (Japan). Faculty of Marine Science and Technology.
S. Okusa, and S. Anma.
Engineering Geology, Vol 16, No 3/4, p 195-224, November, 1980. 24 Fig, 7 Tab, 15 Ref.

Descriptors: *Earthquake engineering, *Slope stability, *Dam failure, *Earthquakes, Landslides, Avalanches, Hazards, *Japan, Izu-Ohshima-Kinkai earthquake.

The general characteristics are described of the failures of natural slopes and embankments which occurred during the Izu-Ohshima-Kinkai earthquake (7.0 on the Richter scale, January 14, 1978). Most of the hazards caused by the quake related to the slope failures of sea cliffs, river cliffs, and road cuttings of convex vertical section with the upper parts sloping gently and the lower parts sloping steeply. Large slope failures occurred close to the activated faults. Damage to high concrete retaining walls was due to insufficient bearing capacity of the foundation soil. Buildings in the meizoseismal zone were damaged due to sliding of the underlying embankments and ground displacement due to the activated faults. Deaths and injuries were caused by falling rock blocks and sliding soil masses which struck homes and cars at the foot of steep slopes. Heavy rain may cause secondary failures, rockfalls, and avalanches due to tension

cracks in the middle and upper part of steep slopes. (Small-FRC)

Engineering Geology, Vol 15, No 3/4, p 205-222, March, 1980. 6 Fig, 4 Tab, 14 Ref.

Descriptors: *Dam design, *Rock properties, *Foundation rocks, Dam construction, *Kalyani Dam, *India, Grouting, Rock mechanics, Tectonics.

The Kalyani Dam site, India, required extensive geophysical studies because it is in a tectonically distured region. Several fault and shear zones are present. There were significant differences between the sheared rocks and the undisturbed samples. The sheared rocks had high porosity and elastic anisotropy; low values for density, elastic wave velocity, elastic moduli, and fracture strength; and high absorption. The undisturbed samples showed the reverse characteristics. Shear zone samples also varied in compressional velocity and amplitude, signs of compressive stress. These studies identified the sound and weak rock formations and aided in economical siting of the dam, in proper design (deepening the foundation in fault zones, for example), and in planning the grouting. GALVANIZED PIPE VIES FOR EQUAL ALTERNATIVE STATUS IN STORM SEWER PROJECTS.
Water and Pollution Control, Vol 118, No 7, p 16-17, 1980.

Descriptors: *Pipes, *Storm sewers, Sewers, Construction materials, Galvanized steel, *British Columbia.

Corrugated steel pipe has been used over 8 or 9 years as an alternative for concrete storm sewers. With the successes of the past in mind, it was suggested that Prince George City, British Columbia, could benefit by the use of a second system of corrugated steel sewer pipe. Two critical objections have been raised: optimum water capacity and durability. A formula has been devised that takes into account the hydraulics of smooth bore pipe. To meet the need for maximum capacity, the Hel-Cor Smooth-Flo pipe is prepared with a full circumferential lining of asphalt spun on at high speed in the manufacturing process. The result is a Manning 'n' factor of 0.012. While severe frosts have rippled some sections of pipe over the last few years, other sections are in mint condition. Corrugated steel pipe is now required for catch basin leads because steel will not shatter when blasted with steam to thaw frozen catch basin leads and does not crack under the stress of expansion during freezing. Corrugated steel pipe has a built-in flexibility through the use of 0-ring gaskets and hugger-band joints. Rubber gaskets were used to limit infiltration in this particular project, as the water table north of Prince George is particularly high, and the storm system is needed to direct water during the spring runoff to the Nechako River. Corrugated steel pipe weighs about one tenth as much as comparable concrete pipe. It is flexible and has high compressive strength. (Baker-FRC)

SCROLL CASINGS OF STEEL AND REINFORCED-CONCRETE CONSTRUCTION,
A. N. Mordovina.
Hydrotechnical Construction, No 3, p 245-251, March, 1980. 4 Fig, 1 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 3, p 21-25, March, 1980.

Descriptors: *Casings, *Hydroelectric plants, *Concrete construction, Scroll casings, Steel, Reinforced concrete, Water conveyance, Conduits, *Materials engineering, *USSR.

A combined steel and reinforced concrete scroll casing for hydraulic stations was the most reliable construction of several models tested--steel with ribs, cast metal, banded constructions, reinforced concrete prestressed in an annular meridional direction, and precast monolithic concrete reinforced by prestressed bars. The steel-reinforced concrete construction consisted of a scroll-shaped metal shell imbedded in a reinforced concrete block. The steel and concrete interact elastically to reduce stress on the metal. The stresses were 186 MPa, compared with 560 MPa in the all-metal scroll casing. Scroll casings using this type of construction have been intalled at the Nurek hydrostation, and similar casings are being installed in the Inguri, Sayano-Shushenskoe, and Rogun plants. (Cassar-FRC)

DESIGN AND DEVELOPMENT OF AN AUTOMATED HYDROSTATIC FLEXIBLE MEMBRANE TEST FACILITY,
Water and Power Resources Services, Denver, CO. Engineering and Research Center.
R. K. Frobel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-210809, Price codes: A03 in paper copy, A01 in microfiche. Report REC-ERC-80-9, January, 1981. 28 p, 12 Fig, 1 Tab, 2 Ref, 2 Append.

Descriptors: *Linings, *Membranes, *Testing procedures, *Materials testings, Automation, Computers, *Hydrostatic pressure, Polymers.

An automated hydrostatic test facility was designed and fabricated for testing flexible membrane liners over variable subgrade conditions. The test facility is composed of pressure vessels which are controlled and monitored by a computer. Selected flexible membranes are placed over subgrades in the vessels, the vessels are charge with water, and hydrostatic head is varied using air pressure. The equipment is versatile, easy to use, and adaptable to future research on other hydraulic barrier materials, geotechnical fabrics, or soils. Preliminary testing of a 0.25 mm polyvinyl chloride lining material on the hydrostatic test facility showed that the equipment functioned as designed. The test results indicate that failures, pressures, and time to failure were reasonably reproducible from test to test over the same type of subgrade. Failures over the roughest subgrade occurred in a depression between large aggregates, whereas failure over the finer subgrades occurred predominantly over small sharp aggregate. (Moore-SRC)

APPLICABILITY AND DESIGN CRITERIA OF A BLASTING METHOD FOR CONSTRUCTING DEEP-CUT SECTIONS OF A CANAL FOR TRANSFERRING PART OF THE FLOW OF SIBERIAN RIVERS,
A. E. Azarkovich, and P. P. Chatalbashev.
Hydrotechnical Construction, No 1, p 6-11, January, 1980. 2 Fig, 2 Tab, 3 Ref. Translated from Gidrotekhnicheskoe Stroitel'stvo, No 1, p 5-8, January, 1980.

Descriptors: *Explosives, *Excavation, *Canal construction, *Siberia, Water transfer, Hydraulic structures, Diversion structures, Design criteria, Soil engineering, Water conveyance.

The sidecasting blast technique is discussed as a method of soil excavation for deep cut sections of a proposed 2273 km water transfer canal in Siberia. Explosives are set in trenches to excavate non-rock material. The method is not applicable in saturated soils with high groundwater tables and in quicksand-type soils. Two alternatives are described: first, a design canal depth 15% greater than when using earth excavation techniques, with bank trimming over the whole bank height (including below the water level); and second, a design cross-section of excavation below the given water level with bank trimming above the canal water level. This blasting method is considered for 279 km of deep cut sections, amounting to 12% of the total length and 800 million cu m (25% of the total excavation volume). Total explosive requirements (ammonium nitrate-diesel fuel) are 2-3 million tons over a 6 year period. The second alternative as compared with earth excavation without blasting would reduce capital and labor by 50%, length of construction by 2 years, adjusted expenditure by 17%, and the need for earth moving equipment. However, blasting on this large scale has not been attempted to date. (Cassar-FRC)

USE OF FISH LARVA MORPHOMETRY TO PREDICT EXCLUSION CAPABILITIES OF SMALL-MESH SCREENS AT COOLING-WATER INTAKES,
Michigan Univ., Ann Arbor. Inst. of Science and Technology.
P. J. Schneeberger, and D. J. Jude.
Transactions of the American Fisheries Society, Vol 110, No 2, p 246-252, March, 1981. 2 Fig, 3 Tab, 26 Ref.

Descriptors: *Entrainment, *Mathematical studies, *Screens, *Intakes, Powerplants, Cooling water, *Fish eggs, Regression analysis, Fishkill, *Fish barriers.

Water used for cooling powerplants often contains large numbers of fish larvae that may sometimes be saved by small mesh screens over intake systems. A relationship between total length and body depth and width of fish larvae was used to calculate the efficiency of small-mesh screens in preventing the entrainment of fish larvae at cooling water intakes of powerplants. Regression analyses were used to calculate total lengths of larvae corresponding to body depths of 0.5, 1.0 and 2.0 mm for each species. These lengths were then compared to cumulative length frequencies for the most commonly entrained larvae at the Campbell Powerplant on Lake Michigan in 1978. Results showed that 35-100% (depending on species) of the larvae during this year would not have been entrained if 0.5-mm mesh screening had been used instead of the 9.5-mm bar mesh vertical traveling screens that were used at the intake system. These figures do not consider approach velocities of the intake water, avoidance behavior of larvae or mortality of impinged or extruded larvae. (Geiger-FRC)

FISH MOVEMENT UPSTREAM THROUGH A CENTRAL QUEENSLAND (FITZROY RIVER) COASTAL FISHWAY,

Capricornia Inst. of Advanced Education, Rockhampton (Australia). Dept. of Biology.
J. Kowarsky, and A. H. Ross.
Australian Journal of Marine and Freshwater Research, Vol 32, No 1, p 93-109, 1981. 9 Fig, 4 Tab, 27 Ref.

Descriptors: *Fish passages, *Tidal rivers, *Water level, Dams, Fish barriers, Barriers, *Fitzroy River, Rockhampton, *Australia, Weirs, Rivers, Tailwater, Headwater control, Saline water barriers, Estuaries.

The present fishway at the Fitzroy River barrage, Rockhampton, Australia, did not permit free passage of fish swimming upstream during the sampling period, August 1978 to October 1979. Fish were monitored with a V-trap located above the highest weir in the series of 15 weirs and pools, which form an L-shaped passage. Sixteen species of fish over a wide size range were caught. Species diversity was greatest in summer. Numbers, sizes, and species of fish were affected by tailwater level (peak catches at high tide peak), headwater level, and velocity of the water. Fish accumulated below open barrage gates. Two alternate ways of passing the barrage--via the occasionally inundated flood plain or under open barrage gates-- were not believed feasible. Suggested structural changes were: (1) replacement of the pool and weir design with submerged orifice or vertical slot arrangements, (2) modification of the entrance configuration, (3) installation of telescoping wiers above the fishing exit, (4) extension of the fishway length, and (5) changes in operating policies to account for known effects of tailwater and headwater levels and seasonal variation in species and abundance. URBAN AQUACULTURE OF THE RAINBOW TROUT (SALMO GAIRDNERI),

District of Columbia Univ., Washington. Dept. of Environmental Science.
A. J. Jones.
Available from the National Technical Information Service, Springfield, VA 22161 as PB82-168576, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of the District of Columbia, Report No 29, September, 1981. 15 p, 3 Fig, 4 Tab, 10 Ref. OWRT-A-007-DC(1). 14-34-001-9009.

Descriptors: *Aquaculture, *Recycling, Closed water systems, Aquaria, *Trout, *Fish farming, Temperature effects, Fish food, Vitamins, Amino acids, Rainbow trout, Closed systems.

The raising of the rainbow trout (Salmo gairdneri) in a closed recycling water system in an urban environment is described. Germ-free fingerling trout were raised on a controlled diet over a period of nine (9) months in specially constructed, refrigerated aquaria maintained at 10C and 15C. The results show that this trout adapts well to the environment provided for it and increases in weight and length comparable to or at a more accelerated rate than those raised by conventional fish-farming methods. Rainbow trout raised at 10C have a somewhat slower rate of growth than those raised at 15C. Oxygen concentrations, temperature, and bacterial counts were constantly monitored. This process, with slight modifications, could be used to launch a commercial venture in the urban aquculture of the rainbow trout.
